In regard to the performances of these pnmps the following facts communicated by Mr. Charles Hutchinson, will give a better idea of the valne of the pump than anything else. Mr. Hutchinson has used one of these pumps for some time past at his coal mine (the Hutchinson colliery,) at Kingston, Pa. The depth of the shaft being 175 feet, a column of water of that hight and ten inches in diameter, is raised by it; and rnnning only some ten strokes per minute, it discharges some seventeen gallons per stroke. This low speed is due to the small quantity of water in the mine; as, if necessary, a velocity of forty strokes per minute can be easily obtained, when, of course, a proportionate amount of water would be raised. We learn from the same gentleman that, when starting the pump, it was covered with water; and yet, as soon as the steam was turned on, (which was done above ground at the boilers,) it started and did its work with perfect facility; the valves also work so smoothly and easily on their seats that they made no noise whatever; a point of some interest when recalling the vast wear and tear and ineessant clatter genorally kept up by these parts.

The facility for repairs is a leading characteristio of this pump. Except the breaking down of the main steam eylinder there is no part of either steam or pump end that may not be supplied from an ordiuary machine shop. We are qnito sure that the whole pnmp conld be turned out from any foundry in the country, capable of making castings of the required size. In a word, all that was said in regard to the steam pump is true of this one. Owners of minss will not be slow to appreciate these advantagos, sspecially when they wish for pumps to be used in places where toels and shops are not of easy access. The groat reduction of weight is also a point that will be strongly in their favor, whero the pumps have to be transported on mules over mountain roads or long distances in the mountains on wagons.

The Iron Interest for 1872.

Wo notice that the proprietors of our foundries and machine shops are already rubbing off the accumnlated dust and rust of three oonsecutive years of comparative dull times, incident to the drouth so generally prevailing over all the Pacifie Coast and interior mining region, and are busy in the erection of new and improved machinery, necessary to meet the requirements and improvements of the times, in the rendering of the precious and other metals from their baser matrix. Nor can they be too soou in their preparations, for already orders are pouring in upon them from every side. In California, the old mining grounds of earlier days have been revisited, new placers and new lodes of gold bearing quartz have been unearthed, new assays of long neglected claims have been made, and found to yield, nnder the workings of improved machinery, sufficient to warrant tbe erection of works, where ten years or more ago, success would have boen at best doubtful.

Oregon and Washington Territory are coming down witb their orders for machinery far in excess of the Portland foundries to supply. Tho great interior, Nevada, Utab and Colorado, though sometimes looking to the East witb wishful eyes in hopes of obtaining a moiety of their wants supplied, perhaps at lower rates, still depend upon the San Francisco shops for the great bulk of their miuing macbinery; whilst Arizona is monthly increasing ber demands for additional facilities for tbe working of ber mines. Thus it will be seen that the outlook is one of a prosperous and bnsy future for our workers in iron, and all interests connected with coast or interior mining.

The Mining Commissioner's Report.

We are sorry to see that Mr. Raymond's endeavors to fnrther the circulation and distribution of his reports have not met with the snccess that they deserve. The report was rendered in March, 1871, and the usual number of copies for Congress, the departments, public offices, etc., were promptly ordered. The sterootype plates have been lying idle ever since and no copies were ordered for general distribntion. This, however, has not been the fault of the Mining Commissioner, for he has persistently endeavored to get Congress to take some action as to the nnmber to he printed, otc. A resolution anthorizing an extra edition of 10,000 copies was referred to the committee on printing, as is usual, and after much delay they have finally concluded to order 5,000 copies, a number ridiculously small, taking into consideration the magnitnde of the interests whicb tbe Commissioner represents. The Commissioner of Agricnlture has an almost nnlimited snpply of his reports, both monthly and annnal, and the appropriation for priuting pnrposes in that Department is large, while the Commissioner of mines has a paltry sum of $10,000 per annum with which to perfect his researches, travel, employ deputies, etc.; and he was compelled in 1870, in order to make his report satisfactory to himself to draw on his own private purse to defray necessary expenses. Last year's report, "American Mines and Mining," is very scarce, and but few copies are in circulation on this coast where they are most needed. What is the nse of printing an edition of a work like this, that Congressmen may have the pleasure of sending a number of copies to their constituents in the Eastern States, where they are of no practical value whatever. Tbe statistics, review of mining industry, description of processes, etc., are inestimably valuable to the people engaged in mining on the Pacific coast, and tbe appropriation shonld be large enongb to permit tbis information to be disseminated among those who need it.

The needs and prospects of the West demand a large edition of this work, and it shonld be as accessible as the Agricultural reports are. As it is, a New York firm, with a commendahle enterprise and a dne appreciation of the importance of the report, have printed an edition on their own responsihility and offer it for sale. The Commissiouer has uo interest in this edition either direct or indirect, and it will be placed ou sale as an ordinary work.

Dewey & Co., of the Scientific Press, have obtained the agency for its sale on this coast from the publishers, J. B. Ford & Co., and the books are now on the way. By this means, and witb no thanks to Congress, mining men may be able to get copies of this valuable report.

Causes of Depression of Placer Mining.

In the chapter on the condition of mining industry in California, in Mr. Raymond's last report, "Mines, Mills and Furnaces of the Pacific Coast," of which we have the advance sheets, Mr. W. A. Skidmore contributes some interesting facts concerning the placers of this State. He snms up the causes for the inactivity in past years in placer miuing as follows:

1st. The injudicious system of locations permitted under early mining laws and regulations, through the ignoranee of the miners of the character, extent, and depth of the ditrital deposits. These locations were generally made in claims of 100 feet frontage, running back to the center or backbone of the nearest ridge, regardless of the course of the deposit, such claims being too small to justify the expenditure by individual owners of the large sums necessary to construct tunnels for outlet and drainage of their ground.

2d. The filling and choking up with tailings, after a few seasons of washing, of the ravines, gulches, and rivers which served as outlet for the ground, thus preventing the maintenance of flumes of sufficient length and grade to disintegrate the hard cement found underlying the top dirt, and rendering imperative the construction of long tunnels to the nearest deep stream, requiring, in some cases, years of labor and the disbursment of large sums without immediate returns.

3. The ignorance of the people and of capitalists of the unbounded mineral resources of their own State; the sudden and unhealthy excitements following the discovery of gold in British Columbia, and silver in Nevada; and the efforts of a portion of the press in California, in the interest of land speculators, to "write up" agriculture at the expense of mining.

4th. The uncertain tenure of mining ground under local mining regulations, which differed in every district, and affords no adequate protection to the purchaser of mining ground unless he remained in actual possession.

Prospects for the Future.

In speaking of the future of this branch of mining Mr. Skidmore says:

Many causes have operated to confirm me in the opinion that the future is bright with promise. A more lively interest is felt by capitalist in the examination and development of these dormant resources, and the information disseminated through the medium of the State geological survey, and the various reports of the United States mining commissioners have not been without effect in turning the attention of the people to the vast stores of wealth at their very doors. One of the most encouraging features of future progress is the tendency of consolidation and cooperation on the part of owners of mining ground, who are availing themselvee of the recent act of Congress to acquire a a title in fee simple to the land by means of a United States patent. As an instance of the beneficial operation of this law, we may mention the fact that one company, the North Bloomfield Gravel Company, of Nevady County, are now applying for a patent to 1,500 acres of mining ground, lying between the Middle and the South Yuha river. Should this act be liberally construed hy the various land offices, and no expensive obstacles placed in the way of the miner seeking to acquire title (as was the case in the operation of the act for acquiring title to quartz ledges), much good will result to the State from the passage of thie law.

Important improvements have been made in the manner of using water in the hydraulic diggings. Instead of projectfive hundred to one thousand inchee of water through two or four pipes, the leading mines now run their water through one pipe by means of the recently invented hydraulic nozzles, and discharge it with immensely increased momentum and effect against the bank they desire to wash down, accomplishing greater results with less labor and expenee, and enabling one miner to regulate the discharge of a thoueand inches, in streame of six inches in diameter, by means of a lever, moving a nozzle which turns in any direction, with more ease and accuracy than three men could do it by the old process. So powerful is the force exerted by these large streams; under great pressure, that many cemented gravel banks which formerly required the use of powder blasts before washing, can now be cut down and removed by the action of water alone.

He then specifies a number of drills, hydraulic pipes and the mechanical appliances of mining and improvements in the manner of working, and says: As these improvents are adopted, the amount and profit of this branch of mining increases, and the steady operation of these causes, inclnding the facilities for the procurement of title to mining gronnd, will have a tendency to materially increase the gold product.

Underground Temperature.

Late observations, embodied in a report to the British Association, confirm the results of former investigations touching the rate of increase of temperatnre with increasing depth. The average appears to be about one degree of Fahrenheit to every fifty-four feet of depth; though in some localities the increase is much more, and in others much less rapid. In the Mont Ceuis tunnel, for example, at a point directly under the summit of the mountain, which is quite a mile overhead, the temperature was found to be 85.1 deg Fahr. The mean aunual temperature of the crest, as estimated from a comparison of observed temperatures at both higher and lower levels, is 27.3 deg. Fahr. Assuming this estimate to be correct, the iucrease of temperature downwards is at the rate of 1 deg. Fahr. in 93 feet, which, by applying a conjectural correction for the convexity of the surface, is reduced to about 1 deg. Fahr. in 81 feet, as the corresponding rate under a level surface; and this is about the rate at the Dunkinfield colliery in England, though much lower than the average elsewhere observed.

A more rapid increase than the average given above has been observed at Yakutsk, in Siberia, where, according to Middendorf, the temperature runs up at the rate of 1° Fahr. in 49 feet of descent. Dana mentions that Magnus found in the same locality a gain of 15° Fahr. in descending 408 feet, which is equal to 1° for 27 feet. It is stated on the authority of Geueral Helmerson, of the Mining College at St. Petersburg, that in sinking a well to the depth of 540 feet at Yakutsk, the soil was found to be frozen the entire distauce, and the probabilities were that the frost had reached a depth of 700 feet. One degree of increase in 52 feet of descent was the rate in this well.

It is found that the rise in temperature as the thermometer descends is not always regular, being more rapid at some depths than at others. Thus, in the examination of Shergin's shaft, in Siberia, between the depths of 150 and 200 feet, the temperature rose at the rate of 1° in 20 feet, while between 250 aud 300 feet the increase was at the rate of 1° in 96 feet. A similar, though less marked difference, has been observed in the Kentish Town well in England. Between the depths of 325 and 910 feet, the rate of advance in temperature is 1° in 56 feet, and from 910 to 1,100, 1° in 54 feet. The strata differ materially in the two spaces, in the upper space consisting mainly of chalk and marl, and in the lower space of sand and clay; whence it hae heen suggested that the irregularity of the rise in temperature was due to the varying character of the strata traversed.

Gold Mining on the Colorado.—The Deseret *News* has a correspondence at St. George, who writes, February 5th, as follows: Parties are just up from St. Thomas, on the Muddy, who report considerable excitement in that section ou account of the discoveries of placer gold diggings on the Colorado, above the mouth of the Virgin. The precious metal is found in the fine or flour state and it is reported that half an ounce is made a day to the hand. Several parties numbering in all near fifty men, have made au outfit here and at the Muddy and gone over with three months' outfit to work. The spot they have selected is above the mouth of Grand Wash, near the mouth of Diamond river, probably from 75 to 100 miles either from St. Thomas, St. George or Kanab. Parties have visited and prospected various places along the river, as well as the spot described and say that there is fine gold in the sands all along the river. The parties seem satisfied that they have a good thing and that the Colorado will be lined with mining camps ere another winter sets in.

The receipts of the Patent Office at Washington, last year, were $678,716, and the expenditures $562,104. The balance was paid into the Treasury, amounting to $116,624, making the balance to the credit of the office January 1st, 1872, $759,970. The number of applications for patents was 19,472; of patents granted, 13,333; and of patents expired, 2,654. The whole number granted to citizens of the United States was 12,511.

Winnemucca Silver Mines.

It may not be generally known, says the Humboldt *Register*, but it is nevertheless a fact that the mines in Winnemucca mountain, so far as they have been worked have turned out as good resnlts, if not a better showing than any of the mines in Humbold county or in the Eastern part of the State. Within the last three years there have been over a thousand tons of ore taken from the Wearmouth, French and Kunkle claims, the three principal locations in the district, and shipped to Rye Patch, Reno and San Francisco for reduction. The receipts of the millmen show that this ore gave an average yield of $150 per ton. Some thirty tons of first-class ore taken from the above claims, which are located on the "Pride of the Mountain Ledge," milled as high as $500 per ton. Also, some 250 tons shipped to Swansea went $143 and some cents per ton. Are there any other mines in Humboldt county that have as yet made a better showing? The ledge proper, from which this ore was taken is about 4 feet between casings at the bottom of the incline, 200 feet from the surface, showing a stratum of 40 inches wide solid mineral. From the ore already worked, it is a well-established fact, that the entire ledge between casings is a true fissure vein, and will work over $100 per ton all through. In order to satisfy the curious, we give the numher of the assays made by two experienced aud practical assayers: The general average of 16 assays of different lots of ore as made by J. A. Allgauer was $271.79 per ton. That of 20 assays made by the Cahill Bros., of Austin, Nev., was $235.45; the highest being $2,389.03 and the lowest $28.85. Where is there a ledge in this part of the State, that does, or can make a better exhibit than the "Pride of the Mountain." The Eureka ores are very base and low grade and some two hundred miles off the railroad; the South Mountain (Idaho) ores are about the same as the ores in the Eureka district, and located over two hundred miles north of the C. P. Railroad in a country where snow is four feet deep six months in a year.

It may look a little strange to those unacquainted with the circnmstances, that with such a showing the ledges are not worked. The reason is obvious. The ledges are owned hy men who are unable to erect proper reduction works, and they have learned by experience that ores paying less than $150 per ton, will not pay the expense of shipment and reduction, and leave any margin for the mine owners. If the ore could be reduced at or near the mines, even $50 ore could be made to pay a handsome profit.

Oakville Quicksilver Mine.—We visited, a few days since, the Oakville Quicksilver Mine, situated some fourteen miles above Napa City, and within one mile and a half of the Calistoga Railroad. The company have excavated 3,000 feet of tunnel, and drifts have been run, which denote a rich ledge of 1,500 feet, lying between sandstone and slate. There are about 1,000 tons of ore on the dump, and at least 10,000 tons are developed in the mine. A lare amount of pure cinnabar is now being discovered in the lower tunnels, and, in the opinion of experts, the leads will eoon open into chambere of the same ore. The price of this ore variee in value from $40 to $800 per ton. The Company lately started a ten-ton furnace, which works splendidly and is now turuing out some 400 pounds of quicksilver per day. It is the intention to erect a furnace of much greater capacity when the yield of qnicksilver will be proportionately increased.—*News Letter.*

Starch.—There seems to be among the imports into our State none so needless as that of starch. With soil that produces so bounteons a yield of the raw material, California should be exporting instead of importing it. Other States with less advantages ship starch to foreign ports while we import over $150,000 worth per annum. A late Indianapolis paper aunounces the shipment from that city of two thousand boxes of starch to Liverpool *via* New York. California could land it in Liverpool at an equal if not lower cost for freight than Indianapolis, and certainly our advantages for cheap manufacture will enable us to furnish it ready for shipment at a much cheaper rate. We wonder that some of our farmers have not ere this started a co-operative starch factory to dispose of their surplus produce.

Mechanics, write for your paper.

Nevada's Bullion Product in 1871.

The Virginia City (Nev.), *Enterprise*, says: When we predicted, more than a year ago, that the bullion product of Nevada for 1871 would exceed twenty millions of dollars, most of the journals of California treated the assumption as a pleasant piece of bombast. The complete figures are not before us, but from a carefully prepared statement by the General Agent of Wells' Fargo & Co., we are satisfied that the bullion product of Nevada amounted to not less than twenty-five millions of dollars during the year 1871. This equals the gold product of California, and henceforth we shall claim for this State the first rank as the gold and silver producing commonwealth of the Republic. Assuming the product to be twenty-five millions of dollars, and a simple calculation shows that $536 in gold and silver was extracted from the earth and put in circulation by every man, woman and child in the State. The amounts shipped by Wells, Fargo & Co. from six of the principal districts of the State during the year 1871, are as follows:

PLACE.	AMOUNT.
Virginia and Gold Hill	$11,053,328.28
Pioche	3,982,227.89
Eureka	2,173,105.50
Hamilton and Treasure Hill	1,339,420.33
Austin	965,536.17
Mineral Hill	701,014.00
Total	$20,214,632.17

It is well known that the product of the mines of Virginia and Gold Hill in 1871 was considerably in excess of $11,053,328. The yield, as shown by the books of the County Assessor, exceeded this amount by about two millions of dollars. The statement of the General Agent of Wells, Fargo & Co., was doubtless compiled from the shipments by that Company, and does not embrace a number of district from which very considerable amounts of bullion were taken in 1871. A large amount of base bullion has been shipped directly to the East for separation, from the eastern counties of the State. Much of this is not included in the statement referred to, as it was not shipped through Wells, Fargo & Co. It is therefore reasonable to assume that the gold and silver product of Nevada for 1871 was all of $25,000,000, and that for 1872 it will exceed this amount by $5,000,000.

Manzanita.—This scrubby bush (for it seldom attains the dignity of a tree) is well known to all old Californians, who are Californians enough to have visited the beautiful mountains of the State. The wood of the manzanita is hard and susceptible of a beautiful polish. In early days a man who did not carry a walking-cane made of manzanita was not exactly in the fashion. Such canes became too common however, to continue the rage in California; like "specimen jewelry," they were valued only as presents to he sent East. No one in these days hears of a great man being presented with a manzanita cane which has a gold head quartz setting. The pioneers of the mountains at an early day discovered that the manzanita made a most excellent firewood. It makes the hottest fire of any wood to be found in the State, or perhaps any to be found in the world. There is a drawback, however, to the qualities of the manzanita as fuel. It makes too hot a fire for the stove of the period, It burns out a etove too rapidly for economy. In an old-fashioned fire place the piled manzanita logs with brilliant flame, lively sparkle and glowing coals make all the comfort a fire can make, of a night when the thermometer is coquetting with zero. So the large manzanita bushes have been cut away from the hillsides near mining camps.

The Digger Indians have always used the berries of the manzanita as food. They contain a large percentage of grape sugar and are rich in gluten. Manzanita grows all over the mountain sides of California, on the Coast Range, and on the Sierras. It grows from low down in the foothills to an elevation of 3,000 feet. The production of these berries is therefore practically unlimited, as nature has arranged it. What can be done by cultivation?—*Grass Valley Union.*

Iron Ships.—In one ship-building establishment in Philadelphia there are five first-class iron steamships in process of construction, with an aggregate tonnage of 13,000 tone, which will require for their construction 16,000,000 pounds of iron, and the ships when completed will cost $2,500,000.

MECHANICAL PROGRESS.

Builder's Hardware.

A correspondent of the *Scientific American* calls attention to the poor quality of the large majority of the builder's hardware, now in use, such as nails, screws, hinges, latches, locks, window pulleys, hooks, etc. The correspondent assumes, which is an undoubted fact, that there is not a house carpenter in the country who has not had his patience tried by the poor quality and frequent failure of some of these articles.

Nails, as brittle as cast iron, are quite common articles; the iron of which some of them are made is so poorly welded that they often split by the first stroke of the hammer. Our American screws, in form and finish, are all that need be desired, and yet the material of which some of them are made is so poor that their heads snap in the act of screwing them into soft pine; the round headed ones are especially liable to this fault. The square corner under the head is unfavorable to strength, and a round corner or trumpet form would greatly improve their strength at this point; the slots in some of their heads are so shallow that they are useless until they are reslotted. Those brilliant mineral and porcelain knobs, which add such a pleasing finish to our doors, frequently jar off from their metal sockets for the want of a stronger and deeper dovetail to the sockets; and the sockets are continually getting loose upon the square shanks for want of a snug and proper fit to the screws that hold them on. The rivets that holds the cheeks to the window pulleys are often so slightly headed that the cheeks spread as soon as the weight is applied.

These are some of the defects which sometimes try the patience not only of builders and housekeepers, but of everybody who is able to raise a window or open a door. It would cost but little more to make these things of good material and strong and servicable at the points I have named, than it does in the present faulty manner.

This is a matter of considerable importance; and the correspondent above alluded to thinks if the manufacturers could appreciate it, as some others do, our hardware stores would soon cease to be encumbered with these demoralized articles.

Photographed Nerve Sections.

Dr. Duchenne, of Boulogne, has presented to the French Academy of Medicine an album containing copies of photographs of the appearances presented by sections of the great sympathetic nerve, the spinal ganglia, the spinal cord, and the medulla oblongatta greatly magnified. He fixed the photographs on stone by a process he termed photoautography, the details of which, however, he does not communicate. It is satisfactory to find him stating that the results confirm the substantial accuracy of the beautiful drawings made by Dr. Lockhart Clarke on the central part of the nervous system, and especially upon the medulla oblongata. In his latter experiments Dr. Duchenne has adopted Dr. Clarke's method of preparation with chromic acid and carmine. He states that certain micrographic details come out with wonderful clearness in the photographs, and that by this means some important additions may be made to our knowledge. He has ascertained that in the white substance of the medulla oblongata there are nerve tubules from thirty-three ten thousandths of a millimeter to three-hundredths of a milliter in diameter.—*Nature.*

WELDING COPPER.—To unite two pieces of copper by welding has puzzled many mechanics and metallurgists, but we read, in a cotemporary, of its recent successful achievement. A compound of 358 parts phosphate of soda and 124 parts boracic acid is prepared, and is used when the metal is at a dull red heat; the heat is then increased till the metal becomes of a cherry red color, and the latter is at once hammered. A hammer of wood is recommended for this purpose, as the metal is liable to soften at a high heat; and the hammer should be used cautiously. All scale and carbonaceous matter must be removed from the surface of the copper, as the success of the welding depends on the formation of an easily fusible phosphate of copper, which would be reduced to a phosphide by the presence of carbon.

Straw for Boiler Fuel.

We lately alluded to the possibility of adopting in California the plan recently introduced in some grain-growing sections of Europe, of employing the waste straw for steam boiler fuel, instead of continuing the wastful practice of burning it as refuse. In reference to this matter the New York *Artisan* says:

In no way does the rapid dissemination of information from one country to another bear better fruit than in the development of industries. In California the thrashed straw from vast fields of grain is of little worth, but the steam power required in thrashing is expensive, because of the cost of fuel. No one on the Pacific Coast appears to have thought of adopting the fire-box of the portable boiler to burning straw until experiments in far off Hungary were heard of. In that country, straw for fuel was found to cost but one seventh as much as wood in the furnace. In one experiment, it is stated, a sixteen horse-power engine thrashed four hundred and eighty bushels of grain in twelve hours, with a weight of straw equal to that of half a cord of oak. The story seems extravagant, and we mention it for what it is worth; but there can be no doubt that the quick, fierce blaze of the straw, properly fed to a furnace of suitable construction, might be made to produce a more effective generation of steam than the comparatively slow and sullen combustion of the wood. The plan, at all events, is thought, by Californians well qualified to judge, to be worthy of extended trial on the coast, and it cannot be denied that dry straw should make a better furnace-fire than the wet tan or the damp sawdust successfully used respectively in the furnaces of our Eastern tanneries and lumber establishments.

The Coloring of Veneers.

Some manufacturers of Germany, who had been supplied from Paris with veneer, colored throughout their mass, were necessitated by the late war to produce them themselves. Experiments made in this direction gave in the beginning colors fixed only on the outside, while the inside was untouched, until the veneers were soaked for twenty-four hours in a solution of caustic soda, containing ten per cent. of soda, and boiled therein for half an hour; after washing them with sufficient water, to remove the alkali, they may be dyed throughout their mass. This treatment with soda effects a general disintegration of the wood, whereby it becomes in the moist state elastic and leather-like, and ready to absorb the color; it must, then, after dyeing, be dried between sheets of paper, and subjected to pressure to retain its shape. Veneers treated in this way, and left for twenty-four hours in a hot decoction of log-wood (one part of log-wood to three of decoction), removing them after the lapse of that time, and, after drying them superficially, putting them into a hot solution of copperas (one part of copperas to thirty of water), will, after twenty-four hours, become beautifully and completely dyed black.

A solution of one part of picric acid in sixty of water, with the addition of so much ammonia as to become perceptible to the nose, dyes the veneers yellow, which color is not in the least affected by subsequent varnishing. Coralline dissolved in hot water, to which a little caustic soda and one-fifth of its volume of soluble glass has been added, produces rose colors of different shades, dependent on the amount of coralline taken. The only color which veneers will take up, without previous treatment of soda, is silver gray, produced by soaking them for a day in a solution of copperas (one of copperas to one hundred of water).—*Exchange.*

NEW MATERIAL FOR CRUCIBLES.—A new mineral has recently been discovered at Wocheina, in Krain, a province of Austria, which is reported as promising to become of much importance in the manufacture of cruciblos, etc., for assayers, steel-making, etc. This mineral is called Wocheuit, after the place where it is found. Its chief recommendation lies in its large percentage (50.82) of alumina. Richter has demonstrated that the resistance of crucibles to the effects of heat depends largely upon the amount of alumina contained in the fireclay. The new mineral is found to do best when mixed in about equal proportions with the best fireclay.

SCIENTIFIC PROGRESS.

TO DETECT THE PRESENCE OF ATMOSPHERIC AIR IN ILLUMINATING GAS.—It is well known that gas companies sometimes mix atmospheric air with their gas, which, while it measures more, adds nothing to the intensity of the light; moreover while pure illuminating gas as it exists in a gasometer is entirely inexplosive, a small admixture of air with it renders a gasometer almost as dangerous as a powder magazine. In fact a gasometer in England recently exploded, from being so mixed or adulterated, under circumstances, which, had the gas been pure, could not possibly have produced any such result.

In view of these facts, Mr. Lewis Thompson has devised a solution for the detection of air so mixed which he proposes as follows: A glass flask of about ½ litre capacity, with two tubes in the cork, is provided, and into this is poured 14 to 15 grammes of anhydrous sulphate of manganese previously dissolved in 15 grms. of hot water. To this is added 60 grms. of tartrate of soda dissolved in 90 grms. of hot water. When these are well mixed, 25 centilitres of a caustic potassa solution are introduced and the whole agitated to form a clear solution. This done the cork is quickly placed in the flask and one of the tubes pushed down till it dips below the surface of the solution. The gas may now be passed through this, when, if any air is present, the color of the solution deepens to that of strong porter or even to the blackness of ink, according to the quantity of air which is present.

It is claimed that this preparation will detect the presence of even an infinitessimal quantity of air. If so, it might be made useful as a detection where gas companies are desirous of increasing the bills of their customers, without any expense to themselves.

CHEMICAL CLIMATOLOGY. — Dr. Argus Smith, an English sanitarian and scientist, has recently submitted a paper of enquiry as to whether or not it may yet be found practicable to ascertain the salubrity of any district by means of an exact chemical determination of the nature of the atmosphere of the locality. The Doctor thinks it is safer to examine the condition of the air by a few chemical experiments than by waiting to see how many deaths take place in a thousand of the population. The state of purity of the atmosphere, he considers, is best determined by the amount of albuminoid ammonia which it includes, just as the drinking quality of a water is estimated in proportion to its freedom from that ingredient, with its usual association of germs and other sewage impurities. He selects the air of Valencia, Ireland, on the brink of the Atlantic ocean, as a good example of pure sea air, and gives it a standard number—100. Compared with this, and descending in the scale of salubrity, he instances as as follows:—Scotland, (inland) 1.29; Scotland, (sea coast), 3.11; England, (iuland), 3.15; Liverpool, 4.07; London, 6.03; Manchester, 6.21

PRESERVING BEET LEAVES FOR STOCK.—M. Mehay states, in a French Sugar Journal, that beet leaves may not only be preserved in good condition, as food for stock, for a period of six months or more; but that their food qualities are also actually improved by the process. The mode of preserving is as follows: A weak solution of hydrocloric acid in water is prepared of a density of from 3° to 4° Baumé. The leaves are then placed in baskets or by other suitable means plunged for a moment into this solution. About 1.5 per cent. of the weight in acid of the leaves to be cured is used in preparing the solution. This process is said to be well suited for all domestic animals, and especially for milch cows. Our beet sugar manufacturers should make a note of the above.

EFFECT OF PETROLEUM ON METALS.—A bronze composed of seven parts of copper, four of zinc and one of tin has been found to be so hard that it is very difficult to work, and is yet of considerable value for certain purposes when worked. So great is this value that various methods have been tried, and much ingenuity applied in efforts to devise a ready method of working the alloy. Quite recently, according to *Jour del' Eclairage au Gazette*, M. Bechstein has attained this desirable end *by soaking the alloy in petroleum.*

ILLUSTRATIONS OF POPULAR LECTURES.—One of the most encouraging evidences of the increased interest felt by the American public in the matter of Scientific Progress is the increasing demand for popular lectures upon various scientific subjects. The demand is also calling out the ingenuity of American scientists in devising ways and means for more instructive and striking modes of illustration. As a notable instance of progress in this direction reference has been made to some ingenious devices by which Prof. Morton of New York represents a total eclipse of the sun, showing the advance of the moon; the crescent sun; Baily's beads, and then at totality, the outburst of the "Corona" and the red prominences or "solar flames."

The formation of the sun flames was beautifully illustrated before the vertical lantern by means of a layer of water colored red by carmine, at the bottom of a tank of clear water. The "flames were produced by passing electricity through a fine coil of wire in the tank, by which, owing to the heating of the wire, currents were produced which bore up the red fluid.

In conclusion, to illustrate the value of the compound light of the sun, as compared with the monochromatic light of sodium, the entire building was illuminated alternately with the electric and with pure yellow light, the latter seeming to destroy every trace of color in all objects present.

It is doubtful whether an American audience has ever been favored with more elegantly illustrated lectures on science.

CALEFACTION.—M. Laborde has made some suggestive experiments on calefaction. He let a thin thread of water pass through the jet from the blowpipe, and he found on examination that the water which had thus passed through a heat capable of melting almost any metal, was but slightly warmed; in fact, the difference was but three degrees. If a jet is passed through an ordinary flame, the increase in temperature is considerably higher, probably owing to the incandescent particles carried away by the liquid from the smoke. A sheet of water presents similar evidence. If the jet from the blowpipe is directed against it, it is not pierced, nor is there any sensible heating effect. The finger can be brought to within a few millimeters of the flame, and yet there is no sensation to indicate the close proximity of an otherwise so patent source of heat. It is suggested that if, instead of the metallic curtain used in theaters in the case of fire, a sheet of running water were interposed, so as totally or partly to enclose or shut out the fiery element, that would be an improvement upon the systems at present adopted.

THE CHEMICAL INFLUENCE OF SOLAR LIGHT.—It has been observed that the intensity of the diffused light of the sky (not of that reflected by the clouds) is proportional, within certain limits, to that of the sun. When the altitude of the latter above the horizon does not reach 10°, the intensity of the chemical action of its light is practically nothing, while the action of that which is reflected from the sky is quite appreciable. Now, we know that the chemical intensity of the solar light increases constantly and regularly according as its altitude increases, and that it reaches its maximum when it has passed the meridan.

These phenomena are easily explained, if we recollect the higher the sun mounts in its apparent course, the less distance do its rays have to traverse in the absorbing atmosphere of our planet. As the sun sinks in the afternoon, we remark a corresponding decrease in the active power of its light and the relation pointed out exists without reference to variations in the state of the atmosphere.

THE IRON SHIP A MAGNET.—The following are a few important facts, as deduced by Mr. Stebbing from his experience of iron ships: 1. A compass may be very true on one or several points, and greatly disturbed on others. 2. The errors of one ship are no guide to the errors of another. 3. The errors are least toward the middle of the vessel. 4. Every iron ship is a magnet in itself; some have the north pole aft, and some the south. The magnetic axis is frequently determined diagonally through the ship. 5. There are in all ships two points, either opposite or nearly so, at which there is no error; there are two other points where the error is the greatest. An error will sometimes not alter three degrees in a range of five points, but may then change thirty degrees in the next five points.

Mining Summary.

The following information is condensed mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

AMADOR COUNTY.

Steam Hydraulicing.—Judge James D. Stevenson, of San Francisco, has in operation in a claim near Jackson, a new system of forcing water from a ditch against a hydraulic bank of some 30 to 40 ft. face. He uses a No. 8 Knowles steam pump, with a nozzle of about 1 inch diameter. An additional stream of water assists in working off the tailings. Most of the bank gives away readily to this power, but a larger pump is found to be necessary to pulverize the hardest portions of the deposit. We hope this method will have a thorough trial, and prove up the question whether water for hydraulic purposes, under favorable circumstances, can be economically obtained by use of steam power.

BUTTE COUNTY.

Mining.—Butte *Record*, Feb. 24: Water was turned into the Hendricks ditch last week, and we presume the Indiana Co. are prepared to continue mining without serious interruption. The Cherokee Co. have also turned water into their Butte Creek ditch, and are mining in the Vicinity of Diamondville. The Spring Valley Co. are sending huge quantities of dirt through their flumes, their large iron pipes working satisfactorily.

Inskip.—Cor. Chico *Review*, Feb. 24: The Bull Creek mines are rich beyond dispute, and there is a proposition to make up a Co. with a capital of $25,000 to bring about 600 inches of water into that dist.

CALAVERAS COUNTY.

Great Yield of Gold.—Calaveras *Chronicle*, Feb. 24: Brackett & Co., in Chili Gulch, last week cleared $500 over and above expenses, 12 men being employed. The gold-bearing lead of gravel is widening out as work progresses, and increasing in richness.

Prussian Hill Mine.—Rock is being taken from the Prussian Hill mine, near Railroad, at the rate of 10 tons per day—only one "shift" working. A large quantity of quartz is ready to be hauled to the mill and crushed as soon as the roads are passable.

Bartolo Mine.—The shaft in the Bartolo mine at West Point ie down 70 ft. The ledge is a narrow one at that depth, not averaging over 10 inches; but it is confidently believed that it will widen out as the shaft descends. The rock being taken out prospects finely.

Zacatara.—The lead ehows 3 ft. in width in the bottom of the shaft and it all carries gold. The stamps will be put in motion in a few days.

Lead Discovered.—A very rich quartz ledge has been recently discovered near West Point. It is eaid that the top rock pays $30 per cargo of 300 ibs.

Petticoat.—Good rock has been struck in the Petticoat mine at Railroad. The diecovery was made in the 350-ft. level. The lead is fully 5 ft. wide and 3 ft. of it is composed of rock that will pay well for crushiiig. The quartz is exceesively hard, rendering the runniug of the level elow work.

Contract Let.—W. V. Clark, Esq., proprietor of the mammoth hydraulic at Railroad Flat, has rccently let a contract for running a bedrock tunnel, 800 ft. in length, through which to run his sluices.

Railroad Flat.—Cor. same: The level in the Russian Hill mine is 42 ft. long, the chimney having au average width of 5 ft. of pay ore, which may be estimated at $20 per ton. In the 60 ft. level the chimney is 24 ft. long.

EL DORADO COUNTY.

Cor. El Dorado *Republican*, Feb. 22: Orr's Station is 4 miles north of Centerville, and about two miles south of the middle fork of the American river. There has been a good deal of proepecting done there within the past 7 or 8 months. The Ella quartz ledge in the Hoggs Diggings dist. is considered to be a good claim; it averagee $50 per ton of rock. There is another located by Mr. Anderson, who has, for some time been engaged in running a tunnel to it; last night they put in a blast, and eome of the wall rock thrown out by it seemed to be literally full of gold. The Hunt ledge, is considered about the best mining stock on this divide. In Pilot Hill dist. there are several good claims; among tho most prominent ie the Warner ledge, on the top of Pilot Hill. The Boulder Claim lies almost in the town of Centerville; several boulders have been taken from this claim containing several thousand dollars each.

MARIPOSA COUNTY.

Recommenced.—Mariposa *Gazette*, Feb. 23: The Benton Mills have resumed running. There is said to be about 400 tons of quartz ready for crushing. There is, as yet, no work being done in the Josephine or Pine Tree mines.

Schofield & Co. are putting up one of their concentrators at Bogan's mill on Bear creek. Rock is being taken out and the mill will again be in operation in the course of 2 or 3 weeks.

Hornitos.—Cor. same: Quartz mining is being carried on to a greater extent than ever before, and with reasonable success. The Washington mine and mill are in full hlast, and are getting out splendid ore, as is also the Quartz Mountain mill. The new Pool vein is the richest thing in the way of quartz that has ever been struck in this vicinity. Williams & Martinez have taken out several thousand dollars in the past month. Farrias & Co. the same. Martinez & Valencia (from the same ledge) took out between $7,000 and $8,000 last week, and more in sight. Jack Mossman took out 40 ozs. last Friday, and more in sight. Joy & Co. have fine prospects on the same vein, which is located nearly in the centre of our town.

NEVADA COUNTY.

Bar.—Grass Valley *Republican*, Feb. 23: A $6,000 bar was sent below from Delano's bank yesterday, from a recent clean up at the North Star mine.

Wood's Ravine.—More quartz mining and prospecting are being done near the mouth of Woods' Ravine at this time than for many years past. The Soggs miue employs between 40 and 50 men. The Providence, which is a continuation of the Soggs, is also being actively worked and the present incline is down about 150 feet. Steam hoisting machinery is soon to he erected, and the mine for the first time is to be developed below the water level of Deer Creek. The ledge is large, varying from 3 to 10 ft. in width. The Wyoming mine is yielding good returns. Preparations are also heing made for working 3 other quartz mines in the same vicinity of the spring.

To be Reopened.—The Grant quartz mine, near Forest Springs, idle for several years, is soon to be reopened.

Tunneling.—A Co. who are opening an extensive gravel claim about 2 miles from Grass Valley, recently let a contract for running a tunnel 1,500 ft. on their claim. Last week 6 men run 80 ft. of the tnnnel in slate rock, no blasting being required. The tunnel is excavated 7 ft. wide at the bottom, 5 ft. at the top, and ie 7 ft. high. The workmen, besides excavating the 80 ft., laid a substantial car track, and thoronghly timbered the tunnel, putting in 12 inch posts, with caps aud lagging to match.

Buckeye Mine.—Nevada *Transcript*, Feb. 24: The Buckeye mine is in Willow Valley. Some time since machinery was put upon the mine and an incline commenced. A day or two ago the ledge was struck, and the prospect is very encouraging. The ledge is 5 ft. wide, and the rock is filled with rich looking sulphurets. From Thursday noon, when the ledge was struck, up to yesterday moruing 6 tone of this rock were taken out.

Location.—Shurtleff & Co. have located 12 claims, 150 ft. square each, at Sutton's Ranch, near this city, for quartz mining purposes.

Good Rock.—Grass Valley *Union*, Feb. 23: Yesterday there was a strike into very fine quartz in the tenth level of the North Star; 3 or 4 kegs of ore were sent up yesterday afternoon and the value ie estimated at about $600.

PLACER COUNTY.

Ophir.—Cor. Placer *Herald*, Feb. 24: F. Jones, Supt. of the Bellevue mine, has opened another rich chimney of ore west of the west shaft. He has been stripping and taking down the ledge for the past 4 or 5 days, and it is etill improving in richness and extent. The St. Patrick mill has not yet rcsumed operations, but a supply of wood and coal is being procured, and the mill will be again pounding away in a few days on Bellevue ore. Mr. Patterson, Supt. of the Eclipse mine, has commenced crushing ore at the St. Lawrence mill, and judging from appearances, it is paying as well as anticipated.

Nevada.

ELY DISTRICT.

Bullion.—Ely *Record*, Feb. 18: W. F. & Co. ehipped to day hullion valned at $43,-155.41.

Alps Mine.—Since our last issue there hae been considerable talk about the strike in the Alps mine.

At the 142-ft. level there is a drift which runs east of the ledge 84 ft. from the main shaft. From this point a winze has been sunk 28 ft., giving a depth of 170 ft. from the surface. At this drift a level has been run 21 ft. east and 34 ft. west from the bottom of the winze. The drift shows a very fine body of ore, over 2 ft. wide, aud is as solid and well defined and handsome in appearance as any ledge we have seen in the dist. The west drift also shows a fine ledge throughout its entire length, and the face of both ends of the drift shows the ledge to be solid, wide and rich. The amount of ore now in sight proves this to be a valuable mine. So far every opening along the ledge shows good ore. The course of the ledge is very near due east and west, and pitches north at an angle of 75 deg. The foot-wall presents some breaks in the works, but not more than is found in any other good mine. The ledge is in a quartzite-formation.

Pacific Tunnel.—The tunnel starts east of the road, about 1,500 ft. east of the divide. It is well constructed, being 5 ft. wide and 7 ft. high. Several deposits of ore have heen passed through between the mouth of the tunnel and its present terminus, which is 650 ft. from the starting point. The course of the ledge is S. 30° W. John Cullan has a contract to run the same 40 ft. further, and is making 3 ft. a day. It will have to be run about 200 ft. further to cut the American Flag and Havana ledges. The Burke ledge will be struck iu less than 50 ft.

Newton Booth.—The strike made on the 16th in the lower level of this claim is more than usually encouraging, as it proves that a rich ledge runs across Panaca Flat, from the Lightner shaft to the Page and Panaca, and extends across the entire claim of the Newton Booth. The west drift from the lower level has been run across the ledge, showing the vein to he over 12 ft. wide, the ledge pitching slightly to the east.

EUREKA DISTRICT.

McGarry.—Eureka *Sentinel*, Feb. 20: Work on the Mexican mine is revealing a considerable body of rich ore. It increases in richness as it goes down.

HUMBOLDT.

Antimony.—Humboldt *Register*, Feb. 24: Capt. Cummins, agent for the Truckee Smeltiug Co., has located a ledge about 4 miles north of Rose Creek station on the C. P. R. R. which gives promise of being a valuable mine. Several tests of the ore show 85 per cent. antimony, with from $6 to $10 per tou in eilver. The ledge is said to be 2 ft. wide aud well defined. The Co. have let a contract to have 20 tons of the ore taken out when it it will he shipped to S. F. for reduction.

REESE RIVER.

Morgan & Mauncy--Recse River *Reveille*, Feb. 17: The Manhattan Co. have got the old incline cleaned out and repaired, and are at work opening the mine and taking out ore. The ledge at the bottom of the incline is nearly 2 ft. wide; it is solid and well defined.

Shut Down.—The Mettacom Mill hangs up its batteries to-day. The scarcity and extremely high price of wood and the bad state of the roads are the causes assigned.

Saybrook.—This mine employs 12 men. Ore is being extracted from the 110-ft. level in considerable quantities, a portion of which will work at a high rate.

Pacific Co.—The mines of this Co. are looking [quite as well as at any time in their history. Considerable bodies of ore have recently bcen explored in various portions of the mines, and eome of the rock is of very high grade.

Diana.—Good ore and lots of it is still being taken out.

WASHOE.

Kentuck.—Territorial *Enterprise*, Feb. 22: The Kentuck Co. are taking out 40 tons of ore per pay, which is being crushed at the Devil's Gate mill. A great part of the force engaged in tho mine is employed in retimhering the old drifts from which the timbers were burned at the time of the great fire in the mines, and in fixing up generally. The Supt. informs us that in a short time they will be taking out regularly 60 tons of oro per day.

Buckeye.—The Buckeye mine is looking well and ore is being raised from all the 3 levels. Two mills—the Hope and Sewell's—are running on ore from the mine. The breasts on all the levels are looking exceedingly well and there is in sight in the mine a 3-month's supply of ore.

WHITE PINE.

Bullion.—White Pine *News*, Feb. 24: W. F. & Co. shipped on the 20th, to London for Eherhardt & Aurora M. Co., 2 bare, 138 ibs., valued at $2,585.63. Also, 6 bars for Piermont M. & M. Co., to New York, 429 ibs., valued at $8,127.38.

Treasure Hill Mines—North Aurora. In the Risdale chamber of the North Aurora the usual force of men are employed breasting out. The size of the ore body increases as work is pushed ahead. Tho ore now extracted, mills about $45 to the ton. The hoisting is done by whip at prcsent. The Lady's chamber shows an immense amount of ore. As far as excavated the chamber is 132 ft. in length, 42 ft. wide and 55 ft. to the roof in the highest place. On the south end the south drift commences and runs 130 ft. through low-grade ore. From the end of the 130 ft. drift a breast is in 60 ft. ahead, showing a body of ore 35 ft. high and 25 ft. wide as far as opened, and the ore going down in the bottom of the breast.

Second South Ex. of Hidden Treasure. In the shaft on Nevada St., at the depth of 60 ft., a drift has been run 40 ft. nearly due east, in ore and ledge matter, and crossing the main north and south channel. Near the end of the drift a tunnel is being run in a southerly direction, for the purpose of tracing the ore into the Anchor and Edgar works. In the Anchor tunuel, helonging to this Co., the drift North from the bottom of the incline has reached a distance of 50 ft., stripping throughout the stratified spar wall, which dips east at an angle of about 35 degrees. In this part of the mine a vast body of good millable ore is exposed. Working 10 men.

Silver Plate.—An incline is down 75 ft., showing ore the whole distance. At the hottom of the incline a breast of ore is opened out 75 ft. wide and 5 ft. in thickness. Seveuty four tons of ore on the dumps. The owners think it will mill $100 to the ton. Working 6 men breasting out.

Ward Beecher.—A force of men is at work sinking a winze from the bottom of the Phillpotts chamher, through a body of low-grade ore to connect with the east drift of the Lady's chamber. Have struck the west side, and expect to connect in about two weeks. The tramway is running steadily on ore from the Co.'s mines.

East Sheboygan.—Working the usual force of men on the East Shehoygan, and hoisting to the dumps. Most of the force of men is employed in prospecting and making openings.

San Juan del Rio.—The usual force of men employed. A new character of ore was found in the shaft, at a depth of 24 ft., of a copper silver glance character, assaying $106 to the ton. It shows a good body, and has a good pitch.

South Aurora.—Sinking a shaft in the end of the east drift, from the main tunnel, and doing work as usual iu other parts of the mine.

Noonday.—In the same quality of ore as last reported, and breasting out with the same force of men.

Gen. Lee.—Drifting from the spar seam in a 3-ft. body of ore and piling on dump.

Pocotillo.—The ore has not chauged in grade since our last report.

Outside Dists.—Central Camp.—The Great Western shows good ore the whole length of the location. The International Con. M. Co. has 14 locations on the hill, among which are the Nutmeg-grater, McCaffry, Clayton and others. A force of men has been at work for several months to cut the ledges at a depth of 600 ft. from the croppings. After running a distance of 84 ft., a body of mineral was found. The formation is porphyry, quartzite and ehale. Assays going up into the hundreds have bccn made from the croppings.

Colorado.

Items.—Colorado *Union*, Feb. 15: Baily & Nott have ehipped on account of owners, since our last issue, 24 tons of smelting ore. Palmer & Nichols have shipped 2 silver bars valucd at $1,451.27.

The Hidden Treasure, Leavenworth Mt., is yielding very rich ore. The vein has been struck by cross cuts, in 3 different places, by lessees, and in every cross cut the mineral in the vein shows well. All the mines on Leavenworth being worked are yielding rich ore.

In the Eagle Bird, a neighbor of the Pelican, Maine, Silverplume, Snowdrift and other rich lodes, an adit, disclosing well defiued walls, has been driven on the vein, 450 ft. At 325 ft. from the mouth of the adit, an immense vein, coming in from the east at an angle of about 35° unites with the Eagle Bird and loses itself. This discovery is called the Casket. The Eagle Bird and the Casket are both yielding rich milling ore. The work of drifting east on the Casket aud west on the Eagle Bird, is goiug on with satisfactory, payiug results. The average mill yield of the ore taken from the Eagle Bird, is 206 oz. per ton. The highest assay obtained from ore taken from the mine, is 3,700 oz. per ton, or $4,900 coin value. Large quantities of 2d class ore are accumulating at the mine.

The character of the ore is argentiferous galena, interspersed with gray coppor, blende, and iron and copper pyrites. The mineral deposit has been constant, and gradually increasing in quantity and quality, as work has progressed. No stoping has been done, and yet the ore taken out has paid all expenses and left a handsome profit.

The Mammoth, Sherman Mt., is furnishing good ore in considerable quantities.

The Magnet, Griffith Mt., is a coustant producing vein and has improved in the quality and quantity of its oro yield from the surface in all its workings. Four and a half tons of ors bave just been brought down and crnshed, tho mill sample of whieb gave 370 ozs. per ton. The mino at present shows better than it over did before.

The Bryan, Republican Mt., is a neighbor of the Hise, and other valnablo lodes. The vein has been opened by stripping and cross cuts for about 500 ft. The vein has a very uniform mineral deposit in all the ground opened, aggregating in shafts, cross cuts and drifts, 118 ft. In one portion of the mine we noticed a solid mineral deposit of 10 inches in breadth. The ore is argentiferous galena carrying 100 ozs. in silver, and 60 per cent. lead. There is about 25 tons of choice ore out at the mine.

Matilda Fletcher Lode.—This lodo is on the west sido of Democrat Mt., is yielding $20 a day to tho man, and judging from present developments, the future yield will be constant and of far greater value as depth is gained.

The developmeuts consist of a shaft 60 ft. deep, and 2 adits driven on the vein, one 147 ft. and the other 32 ft. The voin has a breadth of from 5 to 6 ft. between walls. The mine was discovered in July, '71, since which time, 2 men working only a portion of the time, it has produced 7 tons that yielded by mill treatment 1,799 ozs. of silver, and about 15 tons, now at the mine, worth probably 4,500 ozs. or a total of 6,299 ozs. of silver. The vein is nncovered in several places down the hill from the discovery and it is the intention of the owners to open their mine by a drift from the lowest point of discovery on tho vein.

Kansas Lode.—Colorado *Herald*, Feb. 17: Nine claims are being worked on the Kansas, and the lode is producing more gold than at any time during the past 6 months. The following are tho different partios operating:

Wheeler & Sullivan have doue sinking on the First National claim, and have commeuced drifting. They are running 15 stamps of the New York mill on prize ore, for Buck & Co., and 40 stamps on their Kansas oro.

Richards & Co. are sinking through fine looking oro on the Ophir Co's. claim.

Ira Eastbrooks, who took the lease of the Mead claim off the hands of Wm. Lyon & Co., is drifting and stoping in this mine, which presents a better appearance than ever before.

Wolcott & Co. are drifting aud stoping on the Garrison claim, and taking out good pay.

D. L. Southworth is sinking on the next claim east, (Waterman's.)

Root is obtaining rich ore and plenty of it from his claim, near the Boston mill.

On the second claim east of Root's Andrews & Sullivan are raising large quantities of fine looking ore, which is being crushed at Lake's mill, on North Clear creek.

The (English) Kansas G. M. Co. are making money on their claims purchased some months since of J. F. Hardesty.

The claim between Root and Lake & Andrews is being worked with a windlass.

Middle Boulder.—The first 2 shipments of silver from A. D. Breed's new Reduction works, at Middle Boulder, were made within the past 5 days. The first of these embraced 400 lbs and the last 6,200 oz. of silver in bars, the product of ore from the Cariboo mine. The bullion has been forwarded to New York.

The Cariboo is said to be looking as well and yielding even better than at any former time in its history.

The Seaton and Adjacent Mines.—Four different parties, employing about 30 men, are workiug claims on the Seaton lode. About 25 tons of rich silver ore are taken weekly to the Boston & Col. Smelting works, being a larger amount than at any previous time. Lewis is retaining the richest portion of his ore at the mine. He is also driving a tunnel to intersect the vein, which is expected to prove up the lode to better advantage than all the work that has heretofore been done in sinking.

The Victor lode on the same monntain, is producing well, employs 12 meu, and last week contributed 4 or 5 tons of smelting ore, which was sent to Hill's Works.

The Queen lode is worked undor lease, by tho same parties who are working Updegraph's half of the Veto lode. Both of thoso mines are yielding valnable quartz.

Bepra & Lacoix are working one-half of the Veto lode and have 30 tons of fine ore out at the mouth of the shaft.

Gilson is taking ore to the Boston & Col. Smelting W., from the dump pile at tho Franklin lode.

Cariboo.—Martin & Co. put 12 additional men at work on the east half of the Cariboo lodo this week.

A quantity of 2d-class ore from the Seven-Thirty lode recently treated at the B. & C. smelting works, yielded $315 per ton in silver.

Tho shaft on the Elephant lode is 115 ft. deep and sinking continues, and just at this time through a pockot of pay.

Tho Champion (English) G. M. Co. that recently purchased 600 ft. in the Califoruia, togother with the Champion lode, (situated on the flat abovo the head of Prosser gulch) for £32,000, is fitting up tho engine on the former, preparatory to commencing active operations. Water will be pumped from the deep or Stalker shaft for the use of the engine on the next shaft above, where the mining operations for the present will be conducted.

There is every prospect that the Gregory lode will be worked again throughont its entire length within the next 3 months.

Corbett Bacon is working the Mazeppa lode in Russell dist., and sends his ore to Brastow's stamp mill, which was recently set in operation again.

The Mines.—Brastrow & Aldritch are sinking on the Gardnor lode. No paying ore yet obtained.

John Hogan is steadily working on the Golden Courier.

The Kansas is the heaviest gold producing lode in the mountains, and with its extension, keeps something like 120 stamps in motion, or about one-third of those now employed in the county.

Jack Mellor continues to raise large quantities of the hidden treasure from the Leavitt.

The Commonwealth Co's. mine on the the Prize, is again yielding fine looking oro.

Several claims are being worked on the Cincinnati lode on Casto Hill. Ore from the Stevens claim is crushed at the Stevens mill in Black Hawk.

Four claims are worked on the Jones on Prize Hill, the McDouigle, that of Captain Phillips, the Sullivan & Andrews and one other.

Dexter, Mitchell & Co. are successfully working the Alps mine.

Mr. Nichols, Fisher & Co. are keeping Cons. Gregory mill at work on their ore from the Kent Co. lode.

Mining is going on in the U. P. R. R., Fiske, and Gregory Second near Mountain City, and on some dozen lodes on Quartz Hill.

Gilpin Co.—The head of the Black Hawk tunnel has approached so near the Fiske lode that it has commenced draining it. The water in that mine and in the Bob Tail has visibly lowered during the past few days.

The Central G. M. Co. will commence operations on its tunnel about May 1. It is expected this work will drain the Gunnell lode below any excavation made upon it.

The Quartz Hill tunnel is being driveu steadily into the mountain and is about 600 ft. in length.

Work is being steadily prosecuted in the La Crosse tunnel, which has already peuetrated Quartz Hill for 980 ft. It is passing through a body of ore that contains about 2 ounces of gold to the cord.

Georgetown Items.—Feb. 14: On Jan. 28, 32 sacks of first-class ore were stolen from the Hercnles lode, Brown M. The weight of the ore was about one and a half tons. Assays of this grade vary from 700 to 900 ounces. This was supposed to be worth about $1,000 per ton.

Stewart, of the Stewart Reducing W'k's., lately burned, is at work when the weather will permit, removing the debris and cleaning up the pan-room, in which he estimates there were some $6,000 worth of amalgam and quicksilver. He is making every preparation for rebuilding, and contemplates the erection of a smelting furnace in connection with his other works.

Palmer & Nichols are running as steadily as the weather and their machinery will permit, and are doing excellent work.

Capt. Dean's claim on the Seaton lode, is yielding an excellent quality of ore.

We had an account to-day of the Golconda lode—a very promising silver-vein 4 miles east from the Caribon camp. It was discovered in the Oct. last. The main shaft, which is 30 ft. in depth, discloses a vein of mineral 7 ft. in width. The ore is mainly carbonates of copper, zinc-blende, galena, and assays at the rate of about 45 ozs. silver per ton.

Discovery.—We hear of the recent discovery of a gold lode of remarkable richness, ou the south side of the Left-Hand creek, in Ward Dist.

Ewer & Co., are working the Morrison and Chemung lodes, on the Bobtail Hill. The deepest shaft, 80 ft. in depth, is not being worked at present—operations confined to mining surface quartz; the crevice averaging 10 ft. in width, that is yielding from 8 to 10 ozs. per cord.

The Cash lode at the head of Virginia Cañon, at the depth of 75 ft., carries a very fair crevice of ore, in which is found occasionally very handsome specimens of native gold. Chis. Steinle, the owner, is pushing work in this, and as development progresses the ore improves in quality aud quantity.

Utah.

Star Dist.—Salt Lake *Tribune*, Feb. 17: We were yesterday shown about 100 lbs. of milling ore from the above named Dist. While we have seen much ore from the various mines in the Territory, we must confess that the lot from Star is equal to the best in appearance. From a letter accompanying the rock we make the following extracts:

"The ore is from the Hattie mine, discovered on the 4th inst. It is a rich mine and plenty of ore is in sight. We have been working it this week and have 6 tons of ore on the dump that we think will mill $500 per ton, while others estimate it at a $1,000. The ledge is 4½ wide at a depth of 4 ft. The Last Chance is looking well. This mine is looked upon as being one of the best in the Dist., the tunnel is in 18 ft. The Midas has sold for $40,000 and Old Hickory for $30,000; 1,000 ft. each. But little work had been done on them."

S. F. Stock Exchange Board.

San Francisco, February 29, 1872.

Stock Circles have been rather quiet during the week and prices weak and irregular. A resolution was passed on the 21st inst. permanently fixing the monthly salaries of the officers and employés of the Board as follows: B. H. Coit, Caller, $1,000; Franklin Lawton, Secretary, $400; B. F. Hillard, Assistant Secretary, $200; J. M. Blair, Janitor, $200. From the 15th to the 21st inst., inclusive, the sales of the Board amounted to $4,950,000. The sum of $8,000 was sent down from the Piermont mine on the 17th inst. and $5,700 from the Golden Chariot on the 18th. A new stock called the "Adams Hill" has been placed on the lists of the Board. There is to be no dividend this month by the Raymond & Ely, the time for declaring it having been changed. The last weekly reports from the Hale & Norcross and Savage mines show an ore production of 874 tons from the former, and 1,037 from the latter. The Crown Point Mine produced last week, $37,565. On February account $82,000 have been received from the Meadow Valley. On the 26th inst. the Raymond & Ely mine shipped $31,200.

Speaking of Subscriptions.—The proprietors of the Rural Press are frequently obliged to submit to *inflictions* similar to the one following, which has just been thrust upon us; and yet evidently the result of a practiced eye, as regards the appearance of the Rural, and a mind appreciative of its contents.

I wish to become a subscriber to the Pacific Rural Press, and will thank you to forward it to me as long as the enclosed ten dollar legal-tender note will pay for it. I should like to have the subscription include your back numbers since October 28th last, that number included, if convenient. Otherwise, let it run from this time. L. H. R.

Louisville, Ky., Jan. 23, 1872.

The Hunt & Douglas Process for the Extraction of Copper from its Ores. —No. 2.

When protosulphate of iron is used instead of the protochlorid in preparing the hath; or in keeping up its strength, as in the case of ores of the first class, sulphate of soda is formed, which may in great part he crystallized out hy extremes of heat and cold. The formation and accumulation of this sulphate may, however, be prevented by the nse of chlorid of calcium, as already set forth. The still larger production of snlphate of soda, which would take place if calcined ores of the second class were added directly to the bath, is prevented by the use of lime as already described, and that portion which must result from the excess of sulphate of copper, as recommended, may be decomposed hy the addition of small portions of chlorid of calcium from time to time. By attending to these precautions the strength of the bath in chlorid of sodium, and its solvent power may be indefinitely maintained.

We do not claim the nse of any particular form of furnace, nor of any special arrangement for calcining, lixiviating or precipitating, reserving to ourselves the choice of the best form of apparatus for these purposes; neither do we claim the use of protosalts of iron otherwise than in solution, nor the use of perchlorid or other persalts of iron, nor yet the use of snlphurons acid save and except in connection with protosalts of iron, as already set forth.

What we claim as our invention is:

The use and application of a solution of neutral protochlorid of iron, or of mixtures containing it, for the purpose of converting the oxyd or suboxyd of copper, or their compounds, into chlorids of copper.

The use of sulphurous acid for the purpose of decomposing the oxychlorid of iron formed in the preceding re-action.

The use of a process for the purpose of extracting copper from its naturally or artificially oxydized compounds by the aid of the first, or the first and second of the above reactions, substantially in the manner already set forth.

Explanations.

Chloridizing the Copper.—The reaction between protoxyd of copper and protochlorid of iron gives rise to peroxyd of iron, and a mixture of the two chlorids of copper, two thirds being dichlorid, and one-third protochlorid of copper, as shown in the equation A. The red oxyd or dinoxyd of copper in like manner gives rise to peroxyd of iron, but yields a mixture of two-thirds dichlorid and one-third of metallic copper, as shown in the equation B.

A.— $3Cu_2O_2 + 4FeCl = 2Fe_2O_3 + 2Cu_2Cl + 2CuCl.$

B. —$3Cu_2O + 2FeCl = Fe_2O_3 + 2Cu_2Cl + 2Cu.$

Inasmuch as the metallic copper (2Cu) set free in B, is readily converted into dichlorid by the protochlorid, (2CuCl) of A., it follows that if not more than one-half of the copper be dinoxyd, the remainder being protoxyd, the whole will be chloridized by the action of the protochlorid of iron bath.

Solubility of the Dichlorid of Copper.—While the protochlorid of copper is very soluhle, the dichlorid is insoluble in water, bnt readily solnble in a strong solntion of sea-salt, and of most other chlorids. A saturated brine at a temperature of 194° Fahrenheit, (90° Centigrade,) will hold in solution more than 16 per cent. of dichlorid of copper, and at 104° F. (40° C.,) more than 8 per cent. A brine containing fifteen parts of salt to one hundred of water, dissolves at 194° F. (90° C.) 10.0 per cent., at 104° F. (40° C.) 6.0 per cent., and at 57° F. (14° C.) 3.5 per cent. of dichlorid of copper. When these strong solutions are diluted with water they deposit much of the dichlorid asa white crystalline powder. A solution made with five parts of salt to one hundred of water, dissolves at 194° F. (90° C.) only 2.6 per cent., and at 104° F. (40° C.) only 1.1 per cent. of dichlorid of copper. The above figures are approximate, and a little below the results of actnal experiment. 100 parts of dichlorid contain 64 parts of metallic copper.

Composition of the Bath.—The equivalent weight of protosulphate of iron or copperas is 139, and that of common salt 58.5, while that of copper is 31.7 and that of iron 28.0. In prescrihing the proportious for the bath, numbers a little exceeding these are given, to allow for impurities in the salts employed. To chloridize three equivalents, say 95.1 pounds of copper, which are in the state of protoxyd, two eqnivaleuts of protochlorid of iron are prodnced from 280 pounds of copperas and 120 pounds of salt, dissolved in 100 imperial gallons or 1,000 pounds of water. This solution should convert one third of the copper into protochlorid and two thirds into dichlorid, equal to 98.9 pounds of dichlorid of copper. To render this soluble we have prescribed the addition of 200 pounds or 20 per cent. additional of salt to tho bath, while as we have seen, a solution holding but 15 per cent. will dissolve at 194° F., considerably more than this quantity. While these are the theoretical qnantities, there is in practice, from a secondary reaction resulting in the formation of an insoluble basic per-salt, a loss of protochlorid of iron amounting to from five to ten per cent., so that the chloridizing power of the bath is somewhat less than above represented. Moreover, if a considerable portion of dinoxyd of copper be present in the ore the amount of dichlorid will be largar than above calculated. For both of these reasons it is not well to add to the above bath more than 60 or 70 pounds of copper for each 100 gallons. The solution of the copper from a properly prepared ore will he found complete, by several honrs digestion or percolation, even in the cold, but is more rapid in proportion as the heat approaches the boiling point.

Preparation of the Ores.—In the calcination of carbonates, as recommended, the object is to expel the carhonic acid, which would otherwise cause much effervescence in the oath. When the red or dinoxyd predominates in the ore, this should be, in part at least, converted into protoxyd by calcination in the air, since when alone it leaves one third of its copper undissolved in the bath. In oxydizing sulphuretted ores by roasting till all the sulphur is oxydized there is obtained a mixtnre of sulphate of copper with protoxyd and a portion of dinoxyd, which latter, according to Plattner, may amount to 20 or 30 per cent. of the copper. Further roasting at a high heat will convert both this and the sulphate into protoxyd, but this condition is less advantageous, inasmnch as hoth time and fnel are consumed and the copper is rendered less soluble. The large proportion of dinoxyd, moreover, suffices, as already explained, to convert much of the protochlorid of copper into dichlorid, thereby effecting a saving of iron in precipitating.

Consumption of Metallic Iron.—With few exceptions the copper extracted by solution from its ores is thrown down in the metallic state as cement copper, by means of metallic iron. In theory there are required less than 89 (88.3) parts of pure iron to precipitate 100 parts of copper from a solution of protosulphate or protochlorid, but in practice two or three times as much are consumed. This great consumption of metallic iron is due to two principal causes:

1st. In the ordinary processes for extracting copper from its ores by the moist way, acids (and sometimes persalts of iron) are employed to render the copper soluhle, either as the principal agents or as auxiliaries. When these are employed the solutions contain more or less of persalts of iron, which consume the metallic iron that would otherwise throw down the copper. Thus an amount of persulphate holding four equivalents of iron consumes five equivalents of metallic iron, which are thereby converted into protosulphate, four cquivalents of iron at the same time being deposited in the form of an insoluble basic persulphate, which contaminates the cement copper.

2d. The second cause of the waste of iron is the action of the air. In order to separate the whole of the copper from the solutions a digestion of several days with metallic iron is resorted to. The protosalt of iron, which is formed in this reaction, greedily ahsorbs oxygen from the air and is therehy converted into a mixture of an insoluhle and a soluhle persalt. The latter, as ahove shown, dissolves a quantity of iron in its turn, and yields another portion of insoluhle persalt, which falls with the cement copper.

[To be continued.]

River Mining.

Such scenes as the one depicted in our cut are familiar to all who came to California in early times, when placer mining in all its forms was heing carried on extensively. For a number of years after the discovery of gold the attention of the miners was turned almost exclusively to the hars and hanks or in the beds of the rivers and gulches. In those days deep placer mining was almost unknown, and they were content to work the shallow surface diggings, which usually gave very large returns in proportion to the labor required. The bars where the accumulated gold lay hidden under the surface of the stream were collections of sand and gravel stopped in their course by some obstructions or bend in the river, and it was usually necessary in such a case to turn the stream from its course to work them.

FLUMING THE RIVER.

The object of the miner being to extract the largest amount of gold in the smallest amount of time and little labor, the mechanical appliances of the day were what we would call now, quite primitive. Still a large amount of labor was performed by those hardy pioneers in their researches after the "dust." As our illustration (which is from *Hutching's Magazine)* shows, the bed of the river was frequently laid bare by constructing a dam and a large flume to carry the water, thus allowing the miners to get at the bottom of the river.

Of course when this was done and the holes were sunk, considerable water accumulated in them, and the workmen resorted to the means shown to keep them clear. The wheels have a long shaft reaching to the hole, and at the end of this is a drum, over which a belt, fitted with buckets, passes. This belt goes up throngh a square box and the cnrrent of the river furnishes the power for drawing up the surplus water from the diggings. River mining can only be carried on in the summer and early fall, when the water is low and the miner does not stand a chance to see all his work destroyed by sudden freshets. Frequently these flumes were built at great expense in hopes of "striking it rich," and the prospectors were disappointed; but on the other hand the miners somtimes found enough gold in a few weeks to pay all previous expenses and make their fortunes in the bargain. The bars were worked in a very hasty and superficial manner, and no douht in many places, where work was done in early days, there is still a goodly quantity of the shining metal hidden from the sight of men.

While this supply of shallow auriferous dirt lasted, the gold produced was obtained mostly by private companies of working men, whose capital consisted of their muscle and energy. Now when it is found necessary to mine deeper, capital is required to carry on work. River mining attracts very little attention now-a-days, and few, except Chinamen, are found engaged in such enterprises as the one represented in our cut.

Japanese Carpenters.

The Japanese carpenters are ingenious workmen, and their work is done with marvelous neatness. A curious feature of their houses is that they do not contain a nail; all of the joints and timbers being dovetailed together hy many ingenious devices; and the whole work eveu to the rafters, is as smooth as if it had heen polished down with sand-papor. And the Japanese are a ueat people; for they use no paint to hide any blemish of construction or ornamentation, no filigree work or plaster of Paris gew-gaws, but every stick in the huilding is exposed. Every morning, as regularly as she cooks the breakfast or sweeps the floor, tho Japanese housewife takes a wet cloth and scours the whole interior of the dwelling, leaving no part untouched, and no stain or dirt-spot to mark its cleanly appearance. Then the Japanese do not come into the house with muddy hoots, after the style of the American sovereign; but, having covered the floor with neat matting, always remove the dirty sandals before stepping upon it. I stood and watched the Japanese carpenters at their work for some minutes, and noticed the peouliarity of their movements. The Japanese carpenter works toward him —that is, instead of shoving a plane upon the board at arm's length, he pulls it toward him; and he cuts, saws, and chops in the same way. His saws are fixed in handles like a butcher's cleaver, and the teeth slant or rake toward the handle. The planes are constructed like ours; but the wooden portion is very thin aud wide. The adze is fastened to the end of a hooped stick, like the handle of one of the crooked canes worn on the arm on our streets; and altogether their tools are different from ours, yet I cannot observe that they are awkward in appearance, or awkwardly handled.—*American Manufacturer.*

The Ramie Interests.

Perhaps not one-third of all the persons who attended the late State Fair had their attention directed to the few small specimens of ramie cloth that were unpretentiously on exhibition, and of all the number who examined it but a small proportion understood its real value and its significance among the fnture products of the State. As specimens of strong and elegant fabrics they are not excelled by any cloth except that made of silk, and but little inferior to silk in beanty. There is an interest excited in the production of a plant that produces such material, and this interest must increase, since the few experiments that have been tried demonstrate that the climate and soil of California will produce the ramie in perfection. The cloth on exhibition at the State Fair consisted of many patterns for dress goods, some made of ramie entire and others mixed, some with silk and some with cotton. There is no article superior to ramie for productions of cheap and at the same time elegant and durahle dress goods, and if the cultivation of it on a large scale shall realize the expectation that the experiments so far create, the time is not far distant when ramie cloth should be as common as cotton. At the Fair there was a small quantity of the fibre in a coarse state on exhibition. Its great strength is remarkable, which it does not lose when prepared for the finest fabrics. Dress goods as fine and glossy as silk can scarcely be torn at all by the ordinary effort. There is much inquiry relative to the plant among farmers, and we understand there is a ramie company in San Francisco that disseminates information in regard to the culture of the plant and how the cuttings can be obtained. Farmers must not become excited on the subject of ramie cultivation. It is possihle that it may prove not so profitable as anticipated. Labor may be too dear, and unexpected difficulties present themselves in separating and preparing the fihre. But it has qualities that commend themselves, and all difficulties must in time be overcome and the article utilized. That it promises to become an important production of the State is hardly to be doubted.—*Sac. Union.*

The Pullman palace cars are to be introduced on the principal English railways.

Useful Information.

Mechanical Applications of India-Rubber.

Pure india-rubber is of a white color; its dark color, as generally used, being occasioned by smoke. It is composed of hydrogen and carbon, and is soluble in coal-tar oil. When pure india-rubber is combined with flour of sulphur we have the commercial product called india-rubber, of great value, from the many purposes to which it may be applied. The proportion of sulphur to caoutchouc is about 2–5 parts in 100. When the proportions of sulphur are considerably increased and greater heat applied, a product is formed called vulcanite or ebonite, much used in ornament, and composed of 2 parts of caoutchouc or india-rubber, and 1 of sulphur, heated at 300 F.

The wear of vulcanized india-rubber in its application to steam engine pump-valves is a subject of great importance to the marine engineer. The india-rubber valve-covers are affected in many ways, and the duration and time of wearing present certain anomolies. They are subject to various actions, some mechanical and chemical; the specific density of the material, and the formation of the guards of the valves, on the one hand, and the action of the oil in the lubricants on the other. Pure rubber does not present the same advantage for such applications as vulcanized rubber containing a metallic pigment, experiments showing that pure rubber is more readily acted on by oils and grease than that of mixed quality. Pure rubber may be used with advantage where the water is free from grease or oil; but a mixed rubber of a specific gravity of about 1,202 is more generally useful.—*Ex.*

Artificial Eyes — How Made. — For many years eyes of glass for dolls, dummies, wax-work figures, stuffed birds and beasts, have been made in Birmingham; but only since the Exhibition of 1851 have artificial human eyes been produced there, equal if not superior to those of French manufacture. The process of manufacture is simple enough, but it requires, nevertheless, a good deal of manipulative skill. The workman takes a number of glass rods of the requisite colors, and heats them in succession. The first is generally white or colorless glass to form the white of the eye; the next forming the iris; and the third, "a little spot from a black rod," forms the pupil; evenness of the outline is the great object to attain, and this requires no small amount of skill. The demand is prodigious, especially for dolls' eyes, which are packed in hogsheads and sent to all parts of the world.

Blacking.—The lustrous qualities of blacking are frequently derived from ingredients which are most deleterious and destructive to leather. Herr Artus publishes a new formula, and claims several advantages for it, to which we may add its cheapness and accessibility: Three or four pounds vegetable black, 1¼ pounds ivory black, 5 pounds molasses, and 5 pounds glycerine, mixed thoroughly together. Six ounces gutta percha in small pieces, are then melted and when fluid, 20 ounces olive oil are added, and subsequently, 2 ounces stearine. The second mixture, while quite hot, is stirred into the first; and then a further addition of 10 ounces gum Senegal, dissolved in about 3 quarts water, is added. This compound is the stock; for use, it should be diluted with about three times its quantity of warm water.

Impressions from Prints.—Take of oil of turpentine one drachm, liquid potash four drachms, and mix together thoroughly by shaking in a bottle; then saturate a piece of wool thoroughly with the solution and dab it gently on the print. When you find that the print to be copied is nicely damped, place a sheet of white paper over it, then another paper on this, and rub gently with your finger.

Chinese Astronomy.—Prof. Jno. Williams of the Royal Astronomical Society of England, has lately published a book of Observations on Comets, in which he makes a brief allusion to the progress in this branch of science which has been made by the Chinese. He seems to recognize as authentic, observations recorded 2,300 years before the Christian era.

The eleven Territories exceed by nearly 200,000 square miles, the aggregate area of the at present admitted States of the Union.

Dust Rings for Watches.

This is a new dust excluder, to be applied to watches between the top and bottom plates of their works, for the purpose of preventing impurities from entering the works. The underside of the top plate of the works of a watch is beveled at the edge, the beveled portion extending to a shoulder. The dust excluder is made of a metallic spring band, which is laid around the train so as to rest against the beveled portion of the top plate, or against a similar bevel of the bottom plate or both. The ends of the spring band are either made to overlap, or fastened to a cast arch, which is set between the top and bottom plates, and bulged out to admit the protruding main wheel. This arched casting abuts with its rounded ends against the ends of ears formed on the top plate. One end of the band is secured to the cast arch by a screw, and the other end is slotted and fitted over a screw projecting from the arch, the screw being tightened on the narrow part of the slot. When the band is used alone, the screw or connecting pin projects from one end through a slot in the other. The spring power of the band crowds it against the bevel, and serves, therefore, to properly exclude the dust.

Wasteful Use of Gas.—The Board of Trade, of London, has recently submitted an exhaustive report, through a special commitee of experts, with reference to the principles of gas illumination. The follow points with regard to the economical use of gas should attract the attention of gas consumors generally:

By using good burners instead of bad ones, consumers may obtain from 30 to 50 per cent. more light, while their gas bills remain the same. The improvement of burners is important as a sanitary reform, as in furnishing the same quantity of light the good burner will consume less gas and consequently less air and will produce a smaller quautity of the products of combustion, and less heat, than a poor burner. Burners from two newspaper offices gave only one-half the illuminating power of the gas, while several of the burners tested gave only one-quarter the proper light of the gas.

These facts and many others which came to their knowledge proved to the referees that "an enormous waste of gas prevails, with a corresponding pecuniary loss to the public."

London pays $10,000,000 per annum for gas, and the referees believe that one-fourth this sum may be saved by the use of good burners.

Curiosities of Motion.—Is any change operated on a man by a change in the velocity of his motion round the axis of the earth? Suppose, for instance, a dweller in latitude 60 were to suddenly change his residence to the Equator, he would double his velocity. For while at latitude 60, he travels round with the earth at the rate of 500 miles an hour, at the Equator he does 1,000 miles an hour. Again, at latitude 72 the Greenlander is lazily carried round a paltry 130 miles an hour—while the man at the North Pole calmly revolves about once in 34 hours. Of course the motion is unfelt, because all things move together; but the change from the tropical to an artic climate is so great that it may possibly produce physical or mental effects of which we are as yet unconscious. Of course the steering of a ship from north to south must be sensibly effected by the constant acceleration from west to east. On the long railways of Russia, too, I believe it is found that the rails are uniformly more worn on one side than on the other, in consequence of this force.—*Gentlemen's Magazine.*

Filtering Water on a Large Scale.—All the water companies of London are compelled by law to filter the water which they supply to the city, from the Thames and the sea. The only exemption from this rule is the Kirt Co., which obtains its supplies from deep wells, penetrating the chalk formation. The filtering layer through which all this water runs is six feet thick, composed chiefly of sand.

There are three gatherings of coffee in a year in Brazil. Nothing is more beautiful than a coffee plantation in full bloom. The snowy blossoms all burst forth simultaneously, and the fields seem covered with a delicate mantle of white which exhales a fragrance not unworthy of Eden. But the beauty is ephemeral, for the snow white flowers and the delightful odor passes away in twenty-four hours.

Good Health.

A Simple Remedy for Dandruff.

There are doubtless few persons, especially among gentlemen, who do not suffer from the inconvenience of dandruff. Physicians seem to consider it not of sufficient importance to engage their attention, and the poor victims are left either to practice their virtue of endurance, or for a cure, to try some of the many nostrums advertised in public prints.

The intolerable itching which frequently accompanies the troublesome complaint, is not the only unpleasnt feature, as to persons of any pretentione to neatness, the appearence of the white scales on the coat collar and shoulders is very objectionable.

The writer, during a number of years, tried the different alcoholic solutions of castor oil and many other preparations without permanent benefit, and as a last resort, was led to adopt the plan of cleansing the scalp with borax and carbonate of potassa. This proved effectual, but after a persistent treatment of some months the hair became sensibly thinner, and perhaps would soon have disappeared altogether. The belief that dandruff arises from a disease of the skin, although physicians do not seem to agree on this point, and the knowledge that the use of sulphur is frequently attended with very happy results in such diseases, induced me to try it in my own case. A preparation of one ounce flowers of sulphur and one quart of water was made. The clear liquid was poured off, after the mixture had been repeatedly agitated during the intervale of a few hours, and the head saturated with this every morning.

In a few weeks every trace of dandruff had disappeared, the hair became soft and glossy, and now, after a discontinuance of the treatment for eighteen months, there is no indication of the return of the disease. I do not pretend to explain the *modus operandi* of the treatment, for it is well known that sublimed sulphur is almost or wholly insoluble, and the liquid used was destitute of taste, color or smell. The effects speak for itself. Other persons to whom it has been recommended have had the same results, and I communicate the result of my experiments in the belief that it may be valuable and acceptable to many who have suffered in the same manner as myself.—*American Journal of Pharmacy.*

Failure of Cundurango in England.—All that we hear of the results of the trials given to the cundurango bark furnished by our Government to the Middlesex and St. Bartholomew's Hospitals, through the College of Physicians, confirms the fear that any hope which might have been entertained, of a confirmation of the statement of its utility as a remedy in cancer, must be entirely dismissed. Physiologically, it appears to be practically inert, and its therapeutic effects in the treatment of the cancer to be *nil*. It furnishes a slightly bitter extract of feeble character. A detailed therapeutical report will be made by Mr. Hulke, and a careful examination of its physiological action by Dr. Brunton, but this mainly in deference rather to the official sources from which this small supply has been furnished, and to set at rest the excitement caused by the somewhat scandalous claims which have been set up in its favor.—*British Journal.*

The New Stimulant.—Chloral drinking, according to the physicians, is superseding absinthe, opium and alcoholic stimulants among the better classes. An insiduous sedative, its use grows more dangerously on the tippler, than more actively intoxicating drinks. The manufacture of this drug is the best evidence of the extent of its use. In Europe, its production has become one of the leading chemical industries, and it is sold by the ton. Baron Liebig affirms that one German chemist manufactures and sells half a ton a week. The London *Spectator* says: "Taking chloral is the new and popular vice particularly among women, and is doing at least as much harm as alcohol. The drug is kept in thousands of dressing cases, and those who begin its use often grow so addicted to it that they pass their lives in a sort of contented stupefaction. Chloral drunkards will soon be an admitted variety of the species."

The Lungs.—If every cell in the lungs were cut open and spread out on a wall, they would cover a space of twelve yards each way; that is, at every full breath, the air drawn in is spread over a surface of one hundred and fifty yards.

Forests and Rain.

Does the Destruction of Trees Diminish the Rain-Fall?

Boussingault, in his "Rural Economy," gives as his opinion "that the felling of forests over a large extent of country has always the effect of lessening the mean annual rain-fall."

Baron Humboldt states in his Asiatic travels, that "in crossing the steppe of Baraba, on his way from Tobolsk to Barnul, he perceived everywhere that the drying up of waters increases rapidly under the influence of the cultivation of the soil."

The same experienced traveller in his description of Lake Valentia, in the Valley D'Aragua, in Venezuela, a sheet of water on the high table lands, and without any outlet, ascribed the diminution of the waters to "the extensive clearings which had been effected in the course of half a century in the Arragua Valley," and concludes by stating "that men in all climates seem to be bringing upon future generations two calamities at once—a want of fuel and a scarcity of water."

Early travellers on the Colorado Desert, in this State, will remember the cluster of about thirty palm trees at the so-called Palm Springs, on the west side of the cañon, between the Vallecitos Springs and Carrisa Creek, and about twelve miles south of the former. These palms were planted by the padres of the old San Diego Mission. From the traditions of the old Mission we learn that the padree found a small flow of water at irregular intervale at this particular place in the desert. They planted palms there for the same reason which induced the Arabe to plant date palms at the springs in their deserts, viz: shade and water. From the circumstances of the case, the conclusion is a fair one that these Vallecitos Cañon palms were propagated from the dried dates of the Mediterranean, shipped among the supplies to the Mission. These palms increased the supply of water from the springs, and made it perpetual. The same vandal gold-hunting element that used the well buckets and curbs on the Colorado Deserte for fuel, cut down these few palm trees, and the spring shortly after disappeared. What renders this vandalism without excuse is the fact that the palm trees were unfit for fuel.

A similar phenomenon is recorded by M. Desbassyns de Richmond as having occured in the island of Ascencion. Upon planting the trees anew, however, the spring in a few years reappeared. No doubt our palm springs would reappear if we replanted the palms; and we respectfully submit these facts to the attention of the proper Legislative Committee, suggesting that a few hundred dollars be appropriated for this purpose.

Forests retard evaporation; agriculture increases it. Forests hold back the water that has fallen, and thereby diminish the chances of floods. Every leaf, every stick, and the beds of moss and mould are miniature reservoirs.—*Morning Call.*

Elder John Strong.—Probably the largest family in the country, of one original lineage, is the Strong Family. Its founder, Elder John Strong, Ruling Elder of the First Congregational Church of this town, who died April 14, 1699, aged 94 years, had 18 children, of whom 15 had families, most of them large, and some of them nearly as large as their father's. What mammoth mince pies our grandmothers must have made! Their descendants, each and all, have been traced down carefully to the present time, to the number of over 22,000. Their genealogy, costing four years of solid toil, (from 10 to 12 hours daily) involving the expenditure of several thousands of dollars, has been traced by Benj. Woodbridge Dwight, and now issued in two large volumes. Among the representative family likenesses in these books, may be found those of Gov. Caleb Strong, Prof. Theo. Strong, of Rutger's College, N. J., Hon. Edw. Southworth, Prof. James D. Dana, and Rev. Dr. Dorue Clark.—*Northampton (Mass.) Gazette & Courier.*

The doctrine that guano is the deposit or excretia of birds is put sadly at fault by the discovery of large deposits at the bottom of the ocean, showing that it is a stratified deposit of plants and animals of marine origin.

Dynamite is employed with good effect in France for the breaking up of ice in the rivers where channels are required, or where a gorge has taken place.

Scientific Press.

San Francisco:

Saturday Morning, Mar. 2, 1872.

Gold and Legal Tender Rates.

San Francisco, Wednesday, February 28, 1872.—Legal Tenders buying 91; selling, 91½. Gold in New York to-day, 110⅛.

Table of Contents.

Editorials.—Iron Interest for 1872; Mining Commissioner's Report, 129. Precious Metals in the Eastern States; Sargent's New Mineral Land Bill; Laying Fumes of Giant Powder, 136. Giant Powder in Grass Valley; A New Arctic Expedition 137.

Illustrations.—The Selden Double-acting Plunger Pump, 129. River Mining, 134. Col. L. M. Black, of Montana, 137.

Communications.—Wastage of the Precious Metals, 140.

Mechanical Progress.—Builder's Hardware; Straw for Boiler Fuel; The Coloring of Veneers; Photographed Nerve Sections, 131.

Scientific Progress.—To Detect the Presence of Atmospheric Air in Illuminating Gas; Chemical Climatology; Illustrations of Popular Lectures; Califaction; Chemical Influence of Solar Heat, 131

Mining Summary.—Reports from Mines in various States, Counties and Districts; Stock Reports; Markets, Etc., 132–3.

Useful Information.—Mechanical Appliances of India Rubber; Artificial Eyes—How Made; Dust Rings for Watches; Waste Use of Gas, Curiosities of Motion, 135

Good Health.—A Simple Remedy for Dandruff; Failure of Cundurango in England; The New Stimulant, 135.

Domestic Economy.—A German Kitchen; East Indian Method of Cleaning Silverware; Domestic Receipts, Etc, 139.

Miscellaneous—Causes of Depression of Placer Mining; Underground Temperature; Winnemucca Silver Mines; Nevada's Bullion Product in 1871; Manzanita, 130. The Hunt & Douglas Process for the Extraction of Copper from its Ores—No. 2: Japanese Carpenters; The Ramie Interests, 134. Forests and Rain, 135. New Incorporations; Mining Accidents; Tubular Iron Wheelbarrow, 137.

Transportation over Heavy Railroad Grades.—The expense of transporting freight by rail, over the Sierra Nevada is more than five times as much as the cost of transporting the same amount of merchandise over the same distance of level road. A train which requires only one locomotive on a level, requires *five*, when going up the heavy grades on the western slope of the Sierras. Moreover, the special engines used for this heavy work tear and destroy the track in a much larger ratio than the lighter engines used on the plains. From Rocklin station, on the western base of the Sierra Nevada, to the Summit, the distance is 83 miles, and the elevation overcome is 6,768 feet. The actual equivalent of this distance on a level road is 421 miles, or a little over five times the real length of the road itself. It will thus be seen that there is demanded five times the power to operate this 83 miles that would be required to operate the same distance in the valleys.

To Correspondents.—J. W. L. The value of your specimen of clay cannot be definitely determined except by chemical analysis, the expense of which we are not prepared to undergo. Better send some to a competent assayer who will give the desired information.

L. H. and J. A. H. If you will examine the patent reports you will find that the plan you propose is an old one. That principle of propelling boats has been applied, but was unsuccessful.

On File.—Communications from "Eagle Quill" — "Ludlow," G. H. R., and "Quartz."

Annual Catalogue of the officers and students for 1871–2, of the Massachusetts Institute of Technology, is at hand.

Precious Metals in the Eastern States.

A silver "excitement" exists in Owen County, Indiana, and a number of people are making arrangements to sink shafts and prospect the country in the vicinity of a newly-discovered quartz ledge. This ledge is said to be five feet wide and rich in silver and lead. The owner says he has refused $50,000 for an eight interest and intends superintending and working it himself. He has never been in California or Nevada or he would most assuredly "snap" at that offer and throw in another eighth in the bargain. The top of the ledge only has been opened.

In Windsor County, Vermont, the people are exercised over a gold discovery. An island of about 15 acres in extent has been formed in the White River by mud deposits. It has for some years been used as a pasture, but last summer an Englishman named Saltry, who has been in California, got an idea that there was gold in the soil. He leased it on this supposition, which proved correct. He has since released in small portions to a number of parties who are now working it, among them the owner of the land, who paid $500 for the right to dig. The soil is black sand, in which grains of gold are visible.

A telegram dated the 21st inst. chronicles the discovery of gold in the Black Hills, on the White Earth River, in Iowa. It has been found in the bed of Ice Creek a small stream flowing into that river, about 200 miles above Fort Randall. The region is to be more thoroughly prospected in the spring. White Earth River is in the vicinity of Big Horn River, where the Expedition organized at Cheyenne last season expected to find precious metal.

Not to be outdone in mineral producing qualities now comes Wisconsin and says she has gold in Clark Co. According to Prof. R. D. Irving, it is found in small quantities in the quartz veins, occurring not far from the junction of the potsdam sandstone with the eozoic rocks which underlie the northern half of the State. The prevailing rocks in that region are chloritic and talcose schists intersected with veins of quartz. Associated with the gold are small quantities of magnetic iron in scales, pyrite and mispickel, scattered as usual through a tough, white quartz, presenting none of the reddish appearance common to surface gold ores of any value.

It is not probable that any great excitement will ensue from this discovery, as the quartz only assays about 20 cents per ton; still the effort on the part of Wisconsin to be a gold-producing State is commendable, but it is to be hoped that the other Eastern States which follow her example will meet with better success. To make the mines pay they will have to use some process which will work up to a better per cent. than even our mills on this coast. It's no use for you to try, there in the East, we are the treasury of the nation, in this part of the world, and likely to remain so.

Silver Excitement.—A new excitement is likely to begin in the spring in the direction of the Schell Creek mines, in Eastern Nevada. Parties in this city exhibit very rich ore and represent that people are already going to the mines, in numbers. Schell Creek is reached by stage from Humboldt Wells in 14 hours travel; fare $20. Our advice to miners is to let well alone, and if their claims are passable, not to try any new El Dorado but be satisfied with what they have. At all events, wait till spring opens and find out definitely what you are going after before you go. If the country is what it is represented to be, there will be time enough then without any risk of being frozen to death.

"Back Log Studies" in *Scribner's Monthly*, by Chas. D. Warner, author of "My Summer in a Garden," deserves special mention as being of the first order of magazine articles. No. 111 of the series appears in the March number of Scribner.

Sargent's New Mineral Land Bill.

The bill introduced by Mr. Sargent in Congress on the 23d of January, is well calculated to enhance the interests of the mining community. It has already passed the house. The provisions of the law are to give to owners of claims a fee simple of the surface to a certain distance on either side of the claim; to secure the description of the claims, so that they can be clearly identified; to regulate the tenure of possessory title by requiring that a certain amount of work shall be done annually on each claim, and to simplify and cheapen the process of obtaining United States patents for mining ground.

The claims are not to extend more than 300 feet on each side of the centre of the lode nor less than 25 feet; the owner to have the exclusive right to work all the lodes within his boundaries that come to the surface; when in developing a mine, a tunnel is run, the owners of the tunnel are to have the proprietorship of all intersecting lodes not previously discovered, to a distance of 500 feet on each side. Any person or corporation who has spent $500 in working a claim are entitled to a patent on paying $5 per acre. The notice of application to be published sixty instead of ninety days, and the necessary affidavits may be taken by local officers near the mine in question. The bill further provides that patents may be obtained by corporations whether the stockholders are citizens or not.

The provision which entitles tunnel owners to a right of 500 feet on each side of tunnel, of previously undiscovered veins, seem to us to be a superfluous one, for without it the tunnel owner as discoverer of a new vein would have a right to 400 feet, and could locate for his friends 2,600 feet more, which he would prefer to do, instead of having 1,000 feet, if the vein was worth taking up at all. The evils which Mr. Sargent proposes to remedy in the matter of cheapening the process of patenting mining ground, should have been attended to long since, and we should congratulate ourselves in having representatives in Congress who have an eye to the much neglected mining legislation. The provision permitting local officers near the mines to take affidavits to prove possession, expenditure, boundaries, etc., in making out application for patents, instead of having them taken at the land offices, will save time and expense. The absurd rule under which the present commissioner of the Land Office holds that no company shall be entitled to a patent for their mine unless all the stockholders are citizens of the United States, will be repealed under the provisions of this bill.

Premium for Electrical Improvements. The government of France, in 1866, offered a premium of $10,000 for the most useful application of the voltaic pile; time open for competition until April, 1871. At the expiration of the time, the applicants were few in number, and, in the opinion of the *savans*, to whom the matter was referred, none of the devices presented were considered of sufficient merit to entitle the applicant to take the prize. Subsequently—on the 29th of November last—the present government issued another decree renewing the offer and extending the period of competition to November 29th, 1876.

Discovery.—A dispatch from Grass Valley dated Feb. 28 says that two miners named Reese and Depew have made a rich strike on Randolph Hill, near Rough and Ready. From one pan of dust they obtained nine ounces, and took out $600 worth of gold in two hours on Tuesday. The gold is rough and in decomposed quartz. It seems to be a sort of deposit, there being no ledge. Randolph Hill was abandoned years ago as placer diggings.

Allaying the Fumes of Giant Powder.

We have several times taken occasion to refer to Dr. Blatchley's patent for allaying the fumes of Giant powder by the use of a spray of water. Well known facts connected with the power of water for the absorption of gases generally, especially when applied in the form of fine spray, warrants us in assuming that the deleterious effects of the gases arising from the explosion of Giant powder, many be very materially if not entirely obviated by that means.

So efficient is water so used, that two or three men can enter a diving bell and work under water for an entire day, without any communication whatever with the surface atmosphere—the gases produced by respiration being absorbed by the momentary use of a water spray once in fifteen or twenty minutes, and the additional oxygen needed being supplied from the same source. Elaborate experiments are also on record which otherwise show an enormous absorption of gases.

We have no doubt but that the use of the spray would also be found of great advantage in the case of common blasting powder. Experiments show that while a unit of water in the form of spray will absorb only 1.57 of carbonic acid—the gas mainly generated by respiration, as in the case of the diving bell—the same unit will absorb 3.14 parts of sulphuretted hydrogen—the gas chiefly deleterious in the use of common black powder.

We are authorized to state that the inventor will allow any party to experiment with the use of the spray for the above purpose who will report the results of said experiments to this office. The cost and trouble of such an experiment is nothing, as the water can be introduced into the mine through a common hose; the head need not be more than twenty or thirty feet. Experiments in the laboratory and practical trials in the diving bell show that the finer the spray the more effective the result.

The English Copper Supply.—Within the last ten years something like half the Cornish copper mines have been abandoned, and operations in many others greatly curtailed. The home yield of mineral during that time has been reduced from an annual yield of 140,000 tons to 70,000. While we are meeting this large falling off in British yield, the importations of ores from abroad, has, at least during the latter portion of this time also been materially lessened. The receipts from abroad for the first ten months of 1871, of all classes of ore and regulus, was but 86,696 tons against 108,123 tons during corresponding periods of 1870—no small deficiency in the face of a sudden demand and a rising market. Notwithstanding this diminished yield and importation, the foreign customers of England, called for about the same amount in 1871 as in 1870. The demand for 1870 was 32,550 tons against 32,348 tons for 1871—a falling off of nearly 202 tons.

The latest Liverpool quotations of copper, according to Lewis and Sons circular for February, is from £85 10s. @ £87 10s. per ton, according to brand. Ore and regulus is quoted at 17s. @ 17s. 3d. per unit.

Testing Coin.—Prof. Davidson of the Coast Survey, has been appointed one of the commissioners for testing the coin at the U. S. Mint, and its branches, for the purpose of securing a proper uniformity in the coins with their respective standards and weights, as provided by act of Congress.

Gold.—Important gold discoveries are reported to have been made in Coarse Gold Gulch, in Fresno County. The mines were thought to to have been worked out some time since but now promise to become valuable once more.

Giant Powder in Grass Valley.

The Grass Valley *Union* flings some hard words at us for a paragraph which appeared in a communication in the Press of Feb. 24th, with regard to the present unhappy controversy now going on in that town in reference to the use of Giant powder in the mines. When the article was penned and passed the supervision of the editor of this paper, the facts set forth therein were strictly true, taking the *Union's* own version of the matter at the time. Unfortunately, however, the article after being put in type and proved, was crowded out of the issue for which it was prepared, and found its way into the next number without our notice, after the condition of the controversy had materially changed, by the murderous attacks alluded to by the *Union*. Our record will show that, while we are ever ready to advocate the real interests of the miner, we have never sustained them in any unlawful acts. Indeed, in the very article quoted by the *Union*, the following paragraph occurs: "They [the miners] may depend upon our hearty support so long as they only resort to *lawful means* to abate what they claim is a serious injury to their interests."

The *Union* also intimates that the objectionable paragraph was called out through the influence of unworthy notices connected with the sale of Dr. Blatchley's patent for allaying the fumes of Giant powder by means of a water jet. In making the allusion to that patent, we were only following our usual very proper policy of calling special attention to what we consider meritorious in our advertising columns, and in furtherance of this idea our readers will find some additional remarks upon the subject this week, to which we would call their especial attention.

The Tubular Iron Wheelbarrow.—This is one of those simple yet excellent inventions, that whilst it seems strange that it was never thought of before, possesses a merit that ought to stimulate our inventors to the application of the principle involved, to other purposes than wheelbarrow making. Wherever a light and yet strong implement is desired, one which will stand all the vicissitudes of our climate, with its extreme moistnrs and aridity, and it can be formed of tubular iron instead of wood, which latter, is forever swelling and shrinking until it falls in pieces, it should be so constructed. The frames of harrows and cultivators, of horse-rakes and parts of harvesters and even the frames of wagons might be made of tubular iron that would last a man's lifetime. Inventors, try your genius on tubular iron, patent its application to the implement to which you discover its adaptability, and make your fortunes.

New Incorporations.

The following have filed certificates with the County Clerk, San Francisco.

Bowers M. Co.—Feb. 20. Location: Gold Hill District, Silver county, Nevada. Capital, $500,000; in $5,000 shares. Trustees—Richard Ivers, C. Jones, L. B. Frankel, Chauncy B. Land and A. Fleeshbacher.

Louise M. Co.—Feb. 26. Location: Pioche District, Lincoln county, Nevada. Capital stock, $1,200,000, in 12,000 shares. Trustees—A. Kohler, S. A. Raymond, S. A. Coburn, Watson Webb and A. K. Chase.

Juanita Consolidated S. M. Co.—Feb. 26. Location: Esmeralda county, Nevada. Capital stock, $5,000,000, divided into 50,000 shares. Trustees—Wm. Sharon, A. K. P. Harmon, J. D. Fry, J. H. Robinson, A. L. Greeley.

Silver Hill M. Co.—Feb. 27. Location: Gold Hill District, Storey county, Nevada. Capital Stock, $5,400,000, in 54,000 shares. Trustees—A. K. P. Harmon, James C. Flood, Chauncy B. Land, Joseph Holland and W. S. Hobart.

Woodland G. M. Co.—Feb. 28. Location: Calaveras county, California. Trustees—Wm. J. Gunn, Charles F. Brown, William Stuart, George Bower and John H. Wood. Capital stock, $1,000,000, in 10,000 shares.

"West Point," by "Crooks," will appear next week.

Col. L. M. Black, of Montana.

We give, herewith, a portrait of Col. Leander M. Black, of Montana, engraved at this office from a photograph furnished by one of the Colonel's friends at Bozeman, his place of residence. Col. B. is emphatically called a self made man. He left his native State (Kentucky) in 1859, with all his worldly effects in a satchel, and started for the "Far West," bringing up in Colorado, where, by the spring of 1866 he had accumulated a fortune of $250,000, and reached a seat in the upper branch of the Territorial Legislature. About this time he left Colorado for Montana, which he has adopted as his permanent home, and where he has added largely to his possessions; but what is of far more importance, he has also been so fortunate and honorable in his dealings with his neighbors, and his public and private life has been so uniformly faultless that he has secured the friendship and attachment with all whom he has come in contact.

No man in the Territory has manifested more energy and public spirit in advancing the general interest of that region than has the subject of this sketch. At a critical junction in the history of the Territory,

COL. L. M. BLACK.

and when large numbers of hostile Indians were threatening its destruction, and when in response to a call for troops, men were found in abundance, but no means for feeding them, Col. Black came forward promptly, saying, "I will feed all who will fight." He was as good as his word, and long trains of provisions were soon rolling along the road toward the Yellow Stone, to feed the volunteer protectors of Montana. In this prompt act of patriotism the Colonel expended about $150,000, not a dollar of which has yet been returned to him by the Government, whose duty it was to protect the citizens of the Territory at the national expense.

We have now in the hands of the engraver, a large and spirited representation of the city of Bozeman, Col. Black's place of residence, which will soon appear in our columns, with appropriate reference to its history, etc.

Quicksilver.—The following table shows the amount of quicksilver produced in the last three years:

	1869. Flasks.	1870. Flasks.	1871. Flasks.
New Almaden mine	17,000	14,000	18,763
New Idria mine	10,450	10,000	9,227
Redington mine	5,000	4,546	2,128
And sundry other mines	1,150	1,000	1,763
Totals	33,600	29,546	31,881

Grain.—The *Alta's* commercial correspondent writing from New York, says the harvests of southern Russia which are coming in, show such unusual deficits, that there will be but little grain for export from what has been one of the chief supply districts of Europe. Nearly the whole crop will be needed for home consumption.

Mr. Geo. B. Ellery, now on his way to London will act as subscription and advertising agent for the Scientific Press and Rural Press while in that city. His address will be, 5, Lothbury, London, E. C. Eng.

A New Arctic Expedition.

Mr. Octave Pavy, a Frenchman, who recently arrived here, has inaugurated an expedition with a view of reaching the North Pole by way of Behring's Straits. He will leave San Francisco in May in a chartered vessel for Petropaulvoski, where he proposes to procure reindeer, dogs, sledges, etc., necessary for his land journey. He will then proceed through Behring's Straits to Cape Yakan, on the northeast coast of Siberia, where the expedition will leave the vessels and proceed on its own account. Complete outfits have been provided, and among them a somewhat novel raft constructed of rubber after the style of the Nonparsil, which crossed the Atlantic in 43 days. The raft is made of four cigar-shaped cylinders, fastened in the decks by wooden slats to which the masts, rigging, etc. are attached. The whole thing, which is sloop-rigged, is so arranged that it can be packed in a barrel, while, when ready for service it has a capacity of carrying 10,000 pounds of freight, besides the crew. When it is necessary Mr. Pavy will cross the land on sledges, carrying the boat with him. He is very sanguine of success and has given the subject thorough study. He concludes that while so many have attempted the passage by the other route to an open Polar Sea, the existence of which was conclusively settled by Dr. Kane in 1861, it remains for him to prove that it can only be approached by way of Behring's Straits.

Mr. Pavy proposes to make observations on the direction of the currents and their temperature, tides, Aurora Borealis, variations of the compass, and scientific matters generally. He is endorsed by the Geographical Society of Paris, the American Geographical Society of New York, and kindred societies elsewhere. The whole party is to consist of only six men. The usual anti-scorbutic provisions have been supplied and the expedition will be well fitted out generally. We wish the enterprise all success, and hope that no serious impediments will obstruct their progress to the much-talked-of open Polar Sea.

In Memoriam.

Died.—In Westfield, Mass., Feb. 19th, 1872, Maria K. Weller, aged 72 years, widow of Roland Dewey and mother of E. M. and A. T. Dewey, of this State.

Our mother has departed! Her journey of seventy-two years, through the rugged way we all are hastening, has ended. Strong, resolute and dutiful, her life here—the building of her life hereafter—was one of continued labor. Her sweets here have been the recurring harvests of her honest toils and humble teachings. Blessed ever be her memory. Separation may loosen and time lessen the attachment of friend, brother and sister; but age and distance fail to lessen the fondness and faithfulness of a true mother—the ever-loving and watchful heart, whose loss we cannot restore from out the world's vast field of friendship. Passing away through pain that none of less courage could have so patiently endured, we are consoled with thoughts, now, that surely "there is rest for the weary in the sweet fields of Eden." n.

Elevator.—Bradley & Rulofson, the enterprising photographers, No. 424 Montgomery street, have added to their other improvements a patent hydraulic elevator, by means of which ladies and gentlemen are carried to the top of the building without any muscular exertion. They had a reception on the 24th inst., and many availed themselves of the occasion to take a ride.

Improved Bakery.—Weister & Co., No. 17 New Montgomery St., can furnish a new method of constructing furnaces for large bakeries worth examining into by those about building or remodeling. It is under Baker's patent, Dec. 5, 1871.

The Orizaba brought up 968 bars of bullion from Cerro Gordo District, valued at $25,000.

The Sacramento Basin.

From the dome of the Capitol at Sacramento the expanse of water visible around, has more the appearance of a vast basin filled to the brim, than a fertile agricultural valley. It will be well for those who think it an easy matter to suggest a perfectly feasible plan for the reclamation of these low, valley lands, by a system of levees along the banks of the Sacramento river exclusively, and shutting off in many instances by dams the auxiliary drainage offered by the numerous sloughs that traverse the tule lands back from the river proper, to carefully examine and make a note of the enormous quantity of water to be displaced by drainage, before a large part of these lands can be made dry enough the coming summer for successful culture.

Make a note also of the probable hight of levee that would be required at this time, were all the water that now covers the valley, heaped up from both sides and deposited upon a base only as wide as the river bed. It is a mistake to suppose that any levee built at reasonable cost, can be made, that will hold all this great body of water set up as it were on edge. In every other country in the world where levees are built to confine large rivers from overflow, they are back from the banks at distances from one fourth to half a mile on either side. And where the country is lower at a distance from the river, than directly on its banks, wide artificial water courses with heavy embankments are constructed through the lowest of the grounds to serve as helpers to drainage during seasons of excessive overflow.

If such partly natural and partly artificial rivers are required in Italy to convey the waters of the Alps to the river Po, and they certainly are, may not the same principle be applied with equal benefit to the great Sacramento Basin and its surplus waters.

Mining Accidents.

A miner named Peter Sevie, working in the Yellow Jacket mine fell 40 feet down an ore chute, on the 13th inst., and was very much bruised.

J. K. Williams while working on a ladder in the Idaho mine last week, fell a distance of 12 feet and received severe injuries.

A miner by the name of Rowe working on the Kent County lode in Montana, fell 40 feet, on the 30th ult., breaking two ribs and otherwise injuring him.

Theodore Oreilli while running in his claim near Clipper Hill, El Dorado Co., last week was caved upon and killed.

Geo. Robinson was badly bruised in Hardy's claims last week by some boulders falling on him.

The same paper informs us that Hector McKay was killed in the Redding claim at Whisky Diggings. He was running a load of dirt down a grade of the tunnel when the car jumped the track, knocked out the timbering and let a cave down upon him. He was 21 years of age.

Sales.—The Georgetown *Miner*, says that the Snowdrift mine has been sold to a company of English capitalists; figures not given.

From the Helena *Gazette* we learn that M. H. Ryan of Beartown, M. T., has purchased an interest in the mining ground of R. and N. Kennedy for the sum of $10,000.

The Isthmus of Suez has been doubled in width within the period of authentic history. When Herodotus wrote, Heropolis stood upon the shore of the Red Sea. The site of that city is now about equidistant from that sea and the Mediterranean. This increase in the breadth of the isthmus is due to the sand which is constantly being thrown up by the waves of the Red Sea.

A Disclaimer.—We have been assured it was not the intention of the San Francisco Boiler Works to convey the impression that the first steel boilers on this coast were made there, but by the men who are at this time employed in that establishment.

Domestic Economy.

A German Kitchen.

A German kitchen generally has but one window, and notwithstanding their proverbial neatness, in many things, the floor of the kitchen is generally as black as oil and coal can make it. This apartment, says a writer, in an exchange, is under the general supervision of the lady of the house, with various subordinates in rank and office. It is the seat of active operations from morning till night, as it is the custom here to eat five times a day.

As I passed the kitchen door this morning, I took a hasty inventory of stock on hand. On the stove I found a whole colony of coffee-pots. They were of various sizes and hues, each bearing evident traces of faithful service. Veterans they must have been, for they were variously maimed and mutilated, some destitute of a handle, others deprived of a nose, yet none of them faint-hearted or discouraged. I regret that I cannot give the exact number of the stalwart group, but when I had counted nine, my attention was called off to a more interesting group of beer-bottles quietly reposing in a basket near by. The stove boasts of one griddle, and a most serviceable piece of kitchen-furniture it is, too. Its services are called into requisition through the whole range of cooking, from beefstake to dessert.

The first active scene of the day begins in the kitchen sometime in the morning, when a brisk broiling, frying, and steeping goes on. A German breakfast consists of coffee and bread. This is served with such delightful indefiniteness, that one scarcely knows whether he has taken breakfast or not. It has no stated time for beginning or ending, but begins any time, when any one feels inclined to commence it, and ends when there is no one to continue it. Never a dinner without soup and beer. A soup is a most extraordinary compound. Therein may be found anything in the line of vegetables which is indigenous to the soil, herbs of various qualities and flavors, the whole catalogue of spices, and other thiugs "too numerous to mention." The eating of soup gives rise to a variety of pleasant emotions, aside from those produced upon the gustatory nerves. It produces a state of expectancy, and one would be thoroughly disappointed if something did not "turn up."

Cook your raisins before placing them in pies, cakes or puddings. Soaking them is not sufficient. Steaming them by pouring a small quantity of boiling water amongst them in a tightly closing dish, and allowing them plenty of time to cook before opening, is a good plan. When raisins are rightly cooked before using they appear plumper, and more palatable, and enough more healthful to be eaten without injury by most dyspeptics.

A Good Soup.—Take a fresh meat bone of any kind and boil until the meat will readily fall to pieces, add pepper and salt for seasoning, potatoes peeled and cut, and a very little thickening, or if preferred put half a teacupful of rice in with your meat when first put on. Bread may be added when taken up, or have some biscuit rolled thin to lay around on the top when the potato is put in. Salt meat soup may be made in the same way by freshening the meat so that it will not make the soup too salt.

To Make Bean Porridge.—Put one pint of beans to soak over night; the next morning put them to boil in a sufficient quantity of water for the porridge, with a corned beef bone to season the same; have one pint of corn hulled the day before, and add about two hours before the meat is done. When the meat is done tender take it out, make a little thickening for the porridge with Indian meal and a very little flour. Milk and pepper may be added when eaten, according to the taste.

Spittoons.—Some housekeepers refuse outright to have spittoons in their houses. Their severity in the matter is entirely pardonable, as the sight of them is never an agreeable one, no matter how fine the *cuspidore* may be. One of the best devices in use is the encased spittoon, resembling a small ottoman or foot-rest. A spring near the bottom is pressed by the foot, which raises the cover and the withdrawal of it allows it to fall again. Spittoons in use require daily cleaning.

East Indian Method of Cleaning Silver Ware.

It is the practice of East Indian jewelers never to touch silver and gold with any abrasive substance. The most delicate filigree work and wire constructions of silver are rendered snowy white by the very simple manipulation here communicated: Silver is most susceptible of spotting and discoloration by sea air, the human perspiration, the presence of sulphuretted hydrogen (as seen in an egg-spoon left uncleaned), the excreta of cockroaches and other strong-smelling insects, and lastly, by the contact of mice; the latter cause has irretrievably injured some new plated ware, never used, but left on a side board accessible to these little vermin. Cut some juicy lemon in slices; with these ruh any large silver or plated article briskly, and leave it hidden by the slices in a pan for a few hours. For delicate jewelry the Indians cut a large lime nearly in half, and insert the ornament; they then close up the halves tightly, and put it away for a few hours. The articles are then to be removed, riused in two or three waters, and consigned to a saucepan of nearly boiling soapsuds, well stirred about, taken out, again brushed, rinsed and finally dried on a metal plate over hot water, finishing the process by a little ruh of wash-leather (if smooth work). For very old, neglected, or corroded silver, I dip the article with a slow stirring motion in a rather weak solution of cyanide potass.; but this process requires care and practice, as it is hy dissolving off the dirty silver you obtain the effect. Green tamarind pods (oxalate of potash) are greater detergents of gold and silver articles than lemons, and are much more employed hy the artizan for removal of oxides and firemarks.—*Watchmaker and Jeweler.*

Housekeeping in Germany constitutes a special department of industry, and is called, "Haushalterung." Of course this industry is monopolised hy the woman, and constitutes her chief glory in this land of poets and scholars. No young lady is ragarded as having a finished education, unless she has spent at least ono year in the house of some good family, learning Haushalterung.

Soap.—A young lady, who makes all the family soap, gives the following recipe for a good, cheap article: Add to 10 quarts of water, 6 pounds of quicklime and 6 pounds common washing soda. Put all together, hoil half an hour, and let it stand all night to clear. Draw off the lye, and add to it 1 pound common resin, and 7 pounds of fat. Boil this for half an hour, then let it stand till cool, and cut into hars.

A preparation of one part calomel, five parts wheat flour, one part sugar, one-tenth part ultra-marine, mixed together in fine powder and placed in a dish, is said to he a most efficient poison for mice.

Domestic Receipts.

Honey Fruit Cake.—Take four eggs, and well heat. Sieve in five cups of flour. Add two cups of honey, one of sweet milk, two teaspoons cream of tatar, one of soda, one pound of raisins and currants, one quarter of a pound of citron, one teaspoon each of cloves and cinnamon. Bake in large loaves and slow oven. This keeps fresh for months.

Chocolate Cake.—Take one cup sugar, one-half cup of butter, one-half cup milk, two eggs, one teaspoon saleratus, and two cups flour. Grate half a cake of the unsweetened chocolate (Baker's) and mix with one-half cup milk and the yolk of one egg. Sweeten to taste, and add a teaspoon of some flavoring extract—vanilla is nice. Boil this dissolved chocolate till soft, and then add with it the other ingredients, and bake three-quarters of an hour.

To Prevent Mucilage Moulding.—C. C. writes the *Rural New Yorker*, that he makes it hy using one part of alcohol and three parts of water to dissolve gum arabic; and he keeps a bottle of one part alcohol and two parts of wator with which to thin it when it becomes too thick. It never molds.

Icing Pastry. — When nearly baked enough, take the pastry out of the oven, and sift fine powdered sugar over it. Replace in the oven, and hold over it till the sugar is melted, a hot iron shovel. The above method is preferred for pastry to he eaten hot; for cold, heat up the whites of two eggs well, wash over tho top of the pies with a brush, and sift over this a good coating of sugar; cause it to adhere to the egg and pie-crust; trundle over it a clean brush dipped in water, till the sugar is all moistened. Bake again for about ten minutes.

The California Powder Works

No. 314 CALIFORNIA STREET,

SAN FRANCISCO.

Manufacturers and have constantly on band

SPORTING,

MINING,

And BLASTING

POWDER,

Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.

We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

HERCULES POWDER,

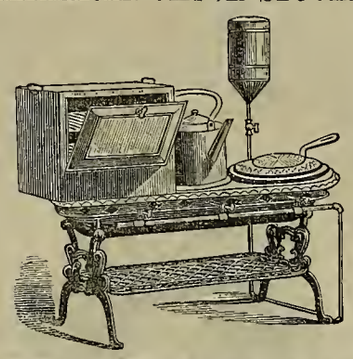
Which combines all the force of other strong explosive now in use, and the lifting force of the BEST BLASTIN POWDER, thus making it vastly superior to any other pompound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office.

16v20-3m JOHN F. LOHSE, Secretary.

THE IMPROVED

AMERICAN VAPOR STOVE.



No Wood, Coal, Smoke, Ashes, Stovepipe nor Chimneys, and Perfectly Safe. Economy and Convenience combined.

IMPORTERS OF AND DEALERS IN

ASSAYERS' MATERIALS,

Chemical Apparatus and Chemicals,

Druggists' Glassware and Sundries,

PHOTOGRAPHIC GOODS, ETC.,

512 and 514 Washington street, SAN FRANCISCO.

We would call the special attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our large and well adapted stock of

ASSAYERS' MATERIALS

—AND—

Chemical Apparatus,

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast.

WE ENUMERATE IN PART:

Assay Balances—L. Oertlings, London.
Assay Balances—Becker & Sons, Antwerp.
Chemical Balances—Becker & Sons, Antwerp.
Ore or Pulp Balances—Becker & Sons, Antwerp.
Assay Weights—Grains and Grammes.
Bullion Balances and Weights.
Humid Assay Apparatus.
Iron Furnaces—Improved, Lined with Fire Brick for Cupelling and Melting.
Tongs, Muffles, Cupel Moulds, Assay Moulds, Scorifiers, Roasting Dishes, Annealing Cups, French Clay, Assay Crucibles, Hessian (or Sand) Crucibles.
Dixon's Celebrated Black Lead Crucibles and Covers—all sizes.
Assayers' and Chemical Glassware and Assayers' Hardware—a full assortment.
Steel Stamps for hair cut to order.

ACIDS AND CHEMICALS.

Acid in carboys and bottles, commercially and chemically pure.
Bi Carb. Soda, Borax, Bone Ashes, Litharge.
Assay Lead in bare, rolled and granulated.
Black Oxide Manganese, Sodium and Sodium Amalgam, Sulphate of Copper, Quicksilver, and all Chemicals and Reagents required hy Assayers and Milling Co.'s.

☞ Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in Grains and Grammes, will be sent upon application.

24v23-tf JOHN TAYLOR & CO.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

☞ For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will he spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco.

GOLD-SAVING

Silver-Plated Amalgamating Plates

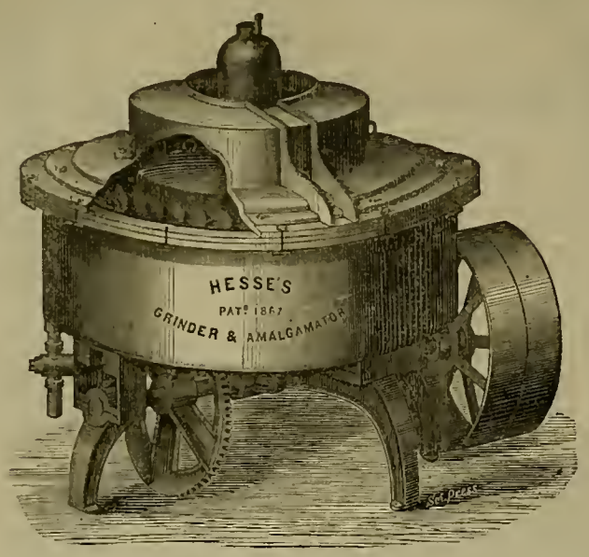
THE HESSE GRINDER AND AMALGAMATOR.



This machine is the most complete and desirable grinder and amalgamator now in use. Owners of Quartz Mills and Sulphuret Works will find it greatly to their interests to use this machine. The following are some of its many advantages, viz: The comparatively little power required to run it; the small wear of metal in comparison with other grinders; the large amount of work that may be accomplished in a given time, being about three times the amount usually performed in ordinary pans; the continuous working process, whereby the labor of handling the ore is avoided; the peculiar arrangements and action of the currents in the machine, whereby all the particles of ore are brought in contact with amalgamating surfaces, and are discharged as soon as ground to the required degree of fineness, thus saving an unnecessary waste of power and metal.

IN THE REDUCTION OF SULPHURET ORES,

this machine is especially valuable, the particles are ground exceedingly fine and uniformly sized, which greatly facilitates the concentration of the sulphurets, and leaves them in the best condition for roasting. The Hesse machines are successfully working in several important quartz mills and sulphuret works in this State. For further particulars send for Circular, or apply to

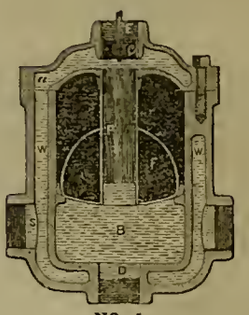
CRAIG & BREVOORT'S
Patent Condenser for Steam
PUMPS, &c.



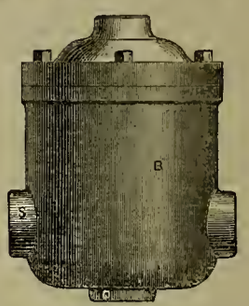
NO. 1.

The annexed engravings represent a Condenser intended to be attached to the ordinary steam pump, thereby bringing it within the class of low pressure, or more properly speaking, of condensing engines; the steam, when it has done its work in the cylinder, instead of being exhausted into the atmosphere, is conducted to the condenser, on its entry into which, it meets the water drawn by the pump, and is immediately condensed.

The Cut No. 1 represents a vertical section of the Condenser, and No. 2 an elevation.

The flange D is bolted to the suction orifice of the pump, and the flange S to the pipe leading to the well, or whatever source of supply the pump may have; W is a water jacket surrounding the main chamber of the condenser, B, and with which the suction pipe, S, communicates, permitting a free circulation of water within the jacket and into the hollow cover or top through the series of openings, one of which is shown at A, and from thence into the body of Condenser, B, through pipe P, carried by float F; the pipe P also acts automatically as a valve to enlarge or contract the space through which the water enters it, by which means the possibility of the condenser being at any time flooded is avoided. The pipe P, it will be observed, also acts as guide to float F.

The valve, O, (shown in Cut No. 1), which is raised or lowered by means of screwed stem—shown coming through elbow in Cut No. 2—is for the purpose of increasing or decreasing the flow of water according to the capacity of the pump to which it is attached.



NO. 2.

The exhaust pipe from steam cylinder is screwed into cover at E; the exhaust steam is thus thrown directly into contact with the water entering the condenser on its way to water cylinder of pump through D. A vacuum being of course immediately formed, acts on the exhaust side of the steam piston, aiding it in its work. If at any time it is desirable to run the pump without the condenser, it is only necessary to turn the three-way cock, which is placed in the exhaust pipe, into such a position as to cause the steam cylinder to exhaust into the atmosphere; when this is done the pump is perfectly free from the condenser, and acts as if it were not attached. This condenser is specially useful for pumps running in mines, or any other position where trouble is experienced in getting rid of the exhaust steam. Address H. L. BREVOORT.

24v22-3m JOSEPH MOORE, Superintendent

Wastage of the Precious Metals—No. 3.

BY ALMARIN B. PAUL.

[Written for the PRESS.]

Montana.

"The trouhls sssms to hs the gold is so impalpshly fins that they loss a very considsrable percsntsge by imperfect manipulations," says ons.

"I hsvs nsver saved more thsn $20 per ton and the ors assays about $50," says another.

Extend tests as far ss you may, on a smaller or larger scale, and wastags stsres ons hadly in the face at every turn.

I mads a tsst of 50 pounds of tailings for a party who took them *a mile above his mill* aud the rsturn was 55 per cent. of what was his average working. I also msde a test of three-fourths of a ton, and the result showed ths loss in ths mill-working to he 63 psr cent. I could write every column of your paper full, corrohorative of ths fact of the enormous loss in the milling of our gold ores. But these given should be as convincing as more; and I hope enough so, to awaken a desire for investigation at least. From what attention I have givsn the suhjsct in actual lahor, as well as collecting all the data attainable from others, I know that the loss as a whole is fully 50 per cent., and, in the majority of mills, all of 60 per cent. of what the ore contains.

I can now ask: Is it not time we were heginning to consider this question of the wastage of the precious metals? It is this that produces so many failures, such utter lost of capital. Investments are made in mining on assays of well sampled ores of the mines, hut not until machinery is running, do they realize the fact that only a small percentage of the metal is saved, and a failure too often is inevitable. Among the evils of mining may be enumerated, at times, too much science and too little practice; then again conceited practice and no scisnce. Science is esssntial, practice equally so; strictly, scientific mining may be denominated, science doing nothing; practical mining, science doing something; practical-scientific mining—the grand requisite—is a correct conception of cause and effect—the scientific analyzation of difficulties and the practically overcoming them. But to my suhject. There are a numher of institutions in California that have proved grand successes. They have been exceedingly fortunate, hut their success may he attributed to having ores of high value, not to gaining a high percentage of the metal. For take California mills, and the first class are all on a par in wastefulness, while the poor are not to he considered at all. My tests are from the best, and I leave the reader to fancy what the poorer ones may be.

California in twenty-one years has produced over $800,000,000, and wasted $1,000,000,000 more ! ! For the wastage in "sluicing" is greater than that in quartz mining. The Sacramento river in ages to come, and when it shall he upheaved as were the Sierra Nevada, will gladden the heart of some straggling miner with an auriferous stratum, the wealth of which will throw all histories of Potosi's, Comstock's, and Del Rey's comhined, into the shade.

To remedy the evil, more care must hs taken. The fact is, we are too much of a rushing, reckless people; we have not got sohered down yet; and I dont know as we ever will. It's rush, rush, and make too little solid, permanent, profitable headwsy. We have oceans of wealth surrounding us, and ought to be ths most opulent, refined and wealthy land on earth,—the load-stone for God's creation. But how is it, and why is it, that we are not?

When one examines into the mining interssts of the world and analyzes gold, its fineness as a metal, and then the science which has maintained the general system in vogue for gold more especially, and see how many, many years, all have gone along with one so reckless and wasteful he almost hlushes for the science and mechanical skill of the day, for a greater absurdity cannot exist than the rough, coarse way of dealing with so delicate and valuahle a metal as gold; the general treatment hsing not to catch it hut to run it off. It seems to me, men go mors on what somehody else has done than their own analytical powers.

From data of loss, given in my last article, we must come to the conclusiou that gold mining, not only in California, but elsewhere on the Pacific slope, as all are operating on about the same system, is unquestionably behiud all other hranches of industry in perfectness, and certainly not up to the point it should be. In fact, so imperfect is it, that our gold mining enterprises, as a whole, may be set down as a failure, when ths question of *profit* in all is considered. If it can he considered highly successful in this gsnsral sense, ought we not now to hs teeming with prosperity?

That soms chsngs should bs brought about, must hs evident to all. What that changs will bs or should he, each must determine for himself. In ordsr to better ths interest, all operators should give their attention to incressing the percsntags of yisld without a correspondiug increass of expenditurs. Thers is a hensfit, however, in producing mors, evsn with an equal sxpenditurs, as it gives an additional amount of metal for circulstion, and requires an equivalent of lahor. But this idea, although correct, is an unpopulsr one; it does not helong to ths selfish spirit of the ags, for without a *profit* on lahor, it is not wanted. This ags is for profit, not good, unless the "good" makes the profit.

Ons step in advance would hs,—taking more care. There is too much slashing ahout in our gold mining. Thers is snough in silver, but no compsrison hstwesn the working of the two metals. This plan of seeing how much can hs pounded up and rushed through every 24 hours, is a false, wasteful and ruinous system.

The profit will he found in *how well* and how cheap it can be done. It is in the right direction certainly to reduce ores expeditiously and cheaply, but not to as expeditiously wash *everything* away, having an eye more to pounding up the rock, than to taking up the metal. The following slip, clipped from the PRESS, to my mind, tells quite a long story in itself: "Here is a 40-stamp mill, that pulverizes its 250 tons weekly, employing 40 to 100 men. The ledge averages five feet thick. The Montezuma, too, is located here; hut for reasons hest known to the company, they have permitted their 20 stamps and a good mine to remain idle for the last two years."

Forty to a hundred men gutting a mine, to run how much down stream? I know ssveral similar institutions which work from "40 to 100 men," and at the end of the month the owners do not have one dollar for themselves; whereas lsss expense, less rush, and more metal saved, could turn the scale often from loss to profit, and "20-stamp mills with good mines" need not he idle. I contend that ore can he reduced, held under control for manipulation, and metal amalgamated as cheaply as this uncontrollable sluicing system so universal in California.

That our gold ores are so readily amalgamated, is one of the ruinous ideas extent. The majority of California miners are, in fact, hut little experienced in all the troublesome accompaniments of even gold ores, considering that if the rock does not pay, that it cannot certainly contain it. All, however, admit it to be difficult to extract the gold from iron sulphursts, forgetting that even a small percentage of lead, copper, arsenic or antimony which is to he found in nearly all the gold ores of California, vitiates the mercury in a little while, rendering it quite inefficient in collecting even the gold that otherwise from gravity might be taken up. We hear great accounts of ths value of ores from all parts; hut do they prove up their asssrtions hy the product per ton? One of your correspondents, only a week or so ago, stated in his communications that 'we must have improved machinery or abandon this in use.' He had heen investigating the matter. It is too universal to consider that it is only necessary to rig up a set of stamps, apply the power, and let them rip away smashing rocks, to wash the sands off, forgetting that it is equally as patent to wash off the smaller particles of gold.

[To he continued.]

Rainfall at Sacramento.

[By T. M. LOGAN, M.D., Secretary State Board of Health.]

Jan. 1, 1872. Rainfall for the season to date....12.421 inches
Jan., 1872. Rainfall for the month..... 4.040 inches
Feb., 1872. Rainfall up to 25th..... 4.040 inches

Total for the season up to date.....20.501 inches

REMARES.—February has this season proved a wet month, and the rainfall is now plus the average for the entire season. No rain fell from the 12th te the end of January, except a mere sprinkle on the 23d; so that it would seem the usual interval hetween the former and the latter rains has this season occurred dnring the latter half of January, and not in February, as is the most general rule.

COMPLIMENTARY.—From F. C. Johnson, Vice-President Indiana State Horticultural Society, we have received ths Annual Report of said Society.

From Jay Cook & Co., maps and documents pertaining to the route, resources, progress and business of the "New North West" and its great thoroughfare, ths Northern Pacific Railroad.

AT Shasta the total rainfall for the season, to Feb. 27, foots up 90.27 inches.

DR. SHERMAN'S RELIABILITY.—We are continually receiving letters of inquiry about Dr. Sherman, and his reliability in the specialty of treating and curing rupture. About two years since, a gentlemen showed us a photograph of his taken before he placed himself under the care of Dr. Sherman for rupture. This was a few months after treatment. The difference between the man when the picture was taken and the time when we saw him, was wonderful. He then considered himself cured, and gave the credit to Dr. Sherman. In view of this circumstance, and what we had previously heard, as a matter of interest to those of our readers who might be afflicted in a similar way, we indorsed Dr. Sherman.

In order to remove every doubt, and to make sure that no wrong should he done to any one, one of the associate editors of this paper devoted an entire day to the investigation of Dr. Sherman's system of treatment of his patients. The result of this investigation confirms the truthfulness of our indorsement. Many prominent gentlemen in this city tell us they tried other parties without being benefitted, then placed themselves under Dr. Sherman's treatment and were cured. Perhaps we may express the strongest conviction of our assurance of his success, by steting that if we should ever he afflicted as others were, who have been treated by him, we should go to him for treatment, with every reason to believe that he would effect a cure. Further than this, no man can say.—*Pomeroy's Democrat, N. Y.*

Mining Companies

Should advertise their Meetings, Assessments, and Sales, in the SCIENTIFIC PRESS. Rates more than one-half less than daily publications. Stockholders should take the hint and request their managers to truly economize by advertising in a MINING JOURNAL, where all notices may be seen by cheaply purchasing and examining a weekly. You will thus save money and uphold a journal which upholds your interests.

FOR 25 CENTS we will send, postpaid, four sample copies (recent numhers) of the PRESS. This, we helieve, will induce many to subscribe who have not yet read our papcr. It is a chsap and valushle favor to ssnd a friend anywhere.

CONTINENTAL Life Insnrance Co., 302 Montgomery street, corner of Pine.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the Scientific Press we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Kincaid Flat Mining Company—Location

of works, Tuolumne County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 14th day of February, 1872, an assessment of three dollars per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Sec'y, at his office, No. 220 Clay street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 18th day of March, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 8th day of April, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Trustees.

R. H. CORNELL, Secretary.

Office, 220 Clay street, San Francisco. fe24-td

Pocahontas Gold Mining Company—Location

of works, Mud Springs, El Dorado County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 26th day of February, 1872, an assessment of Five Dollars per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the office of the company, Room No. 26, Hayward's Building, No. 419 California street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on Saturday, the 6th day of April, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before will be sold on Monday, the 6th day of May, 1872, to pay the delinquent assessment thereon, together with costs of advertising and expenses of the sale.

D. A. JENNINGS, Secretary.

Office, Room No. 26, Hayward's Building, 419 California street, San Francisco, Cal.

Fabrnary 26, 1872. mar2-5w

Quail Hill Mining and Water Company---

Location of works, Salt Springs Valley, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 15th day of February, 1872, an assessment of $5 dollars per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary, at the office of the Company, No. 409 California street, up stairs, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 26th day of March, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 16th day of April, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. F. CRONISE, Secretary.

Office, 409 California street, San Francisco, Cal. fe24-td

Silver Wave Mining Company----Location

of works, White Pine Mining District, White Pine county, Nevada.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the twentieth (20) day of January 1872, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. shares.	Amount.

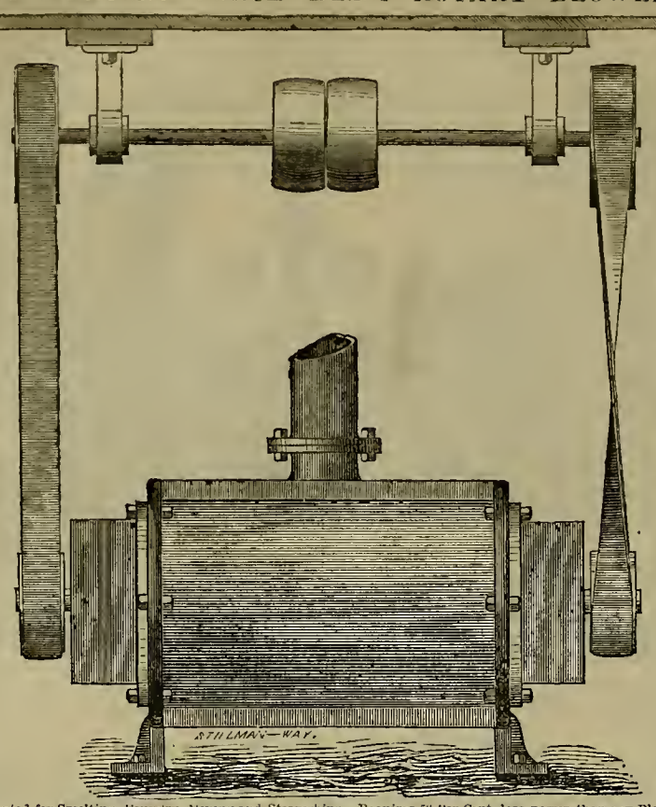
ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

MANUFACTURED BY THE GLOBE IRON WORKS, STOCKTON, CAL. AWARDED FIRST PREMIUM AT PARIS EXPOSITION—PATENTED NOV. 1, 1864; JULY 21, 1865; OCT. 9, 1866.



Adapted for Smelting, Foundry, Mining and Steamships. Requires 50 Per Cent. less power than any Blower now in use. A Blower may he seen at W. T. Garratt & Co.'s Brass Foundry, San Francisco; Gould & Curry and Savago S. M. Co.'s, Nevada; and at C. P. R. R. Co.'s Works, Sacramento; and other places on this coast.

CAUTION.—Purchasers will find it to their advsntsge to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

QUARTZ, SAW AND GRIST MILL, IRON, STATIONARY AND STEAMBOAT ENGINES, HORSE-POWER AND PUMPS, OF ALL SIZES.

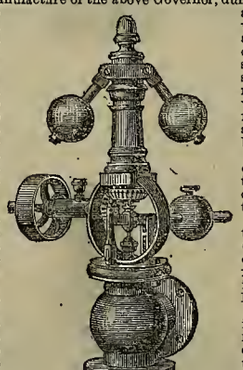
THE GARDNER AUTOMATIC SAFETY-STOP GOVERNOR.

These Governors have now been sold in this market for several years, and wherever once introduced and made known, are invariably sought after. They are in the Eastern States fast displacing all other Steam Governors, and are regarded as *the perfect regulator*. They are manufactured by Messrs. Gorchur & Robertson, practical engineers, who have given many years time exclusively to their manufacture and perfection. The manufacturers say: After an experience of eleven years in the manufacture of the above Governor, during which time several important improvements have been made and two additional patents obtained, we feel justified in recommending it to all parties using Steam power, and warranting it to be the most perfect regulator in the market.



The Gardner Governor is so well known that we think it unnecessary to enter into a detailed explanation of the principles involved, or details in its construction, merely giving the leading objects realized by this important invention. The Governor combines with the greatest simplicity of construction, accurate regulation of speed, POSITIVE INSURANCE AGAINST ALL ACCIDENTS LIABLE TO OCCUR FROM SLIPPING OR PARTING THE GOVERNOR OR DRIVING BELTS, and a convenient arrangement for ADJUSTING THE SPEED OF THE ENGINE WHILE IN MOTION, without change of pullies.

The construction of the Governor is extremely simple, having no springs, inside joints, swivels, or parts liable to disarrangement, all the several parts are duplicates of each other in the same series; the most skillful workmen are employed, the best material used and the machinery employed especially adapted to their manufacture. The valve is most PERFECTLY BALANCED, and the Governor is built with a view of securing the quickest and most sensitive action possibly attainable in a steam regulator. Thus with accurate machinery, and skilled labor, and devoting our WHOLE ATTENTION to the manufacture of THIS ONE ARTICLE, we are able to produce a perfect and reliable Governor at a low price.

We do not publish any letters of recommendations, but can give references to upwards of 5,000 PARTIES THROUGHOUT THE UNITED STATES, who are using the Gardner Governor.

We would especially invite the attention of steam Engine Builders to this Governor, feeling assured that they can purchase for less than they can make an inferior article, and thereby increase the value and sales of their Engines.

We respectfully refer to the following parties using the GARDNER GOVERNOR, and can speak understandingly of its merits: Oakland Cotton Mills, the Selby Lead and Silver Smelting Works, L. & E. Emanuel, Vulcan Iron Works, Fulton Foundry, Levison Bros., Cal. Jewelry Co., Pioneer Woolen Factory, D. A. McDonald & Co., and others in San Francisco; Ophir Co., Lady Bryan, and Sacramento and Meredith Mills, John McCone, Virginia, Nev.; Globe Iron Works, Stockton; A. F. Chury, Albany, Oregon, and many others.

☞ WE WARRANT these Governors to give perfect regulation of speed under all circumstances; and if there is one within one thousand miles of San Francisco, that is not giving perfect satisfaction, it may be returned to us at our expense, and we will exchange it for any other Governor in the country, or refund its price.

☞ When ordering please state whether THROTTLE-VALVE is wanted or not; and whether BLOCK or FINISHED Governor is desired. ☞ THE RATE OF SPEED FOR GOVERNOR IS FULLY STAMPED ON THE REVOLVING HEAD OF EVERY GOVERNOR. Send for circular and price list to

TREADWELL & CO.,

Agents for Pacific States, San Francisco.

☞ At Treadwell & Co.'s (late BERRY & PLACE'S) Machinery and Supply Depot may be found in stock the above Governors, together with all sizes of HOADLEY'S PORTABLE ENGINES, BLAKE'S STEAM PUMPS, STURTEVANT BLOWERS, PORTABLE DRILLS, TAPS AND DIES, DREYFUS'S CYLINDER LUBRICATORS, Etc. Also a heavy stock of HARDWARE AND MINING TOOLS, LEATHER BELTING, LINEN HOSE, BOILER FELT (saves 25 per cent. of fuel), SELF-OILERS, LACE LEATHER, STEAM PACKING (all kinds), BELT STUDS, Etc., Etc., embracing every description of Engineers' and Machinists' supplies and Millmen's findings. 7v24-tf

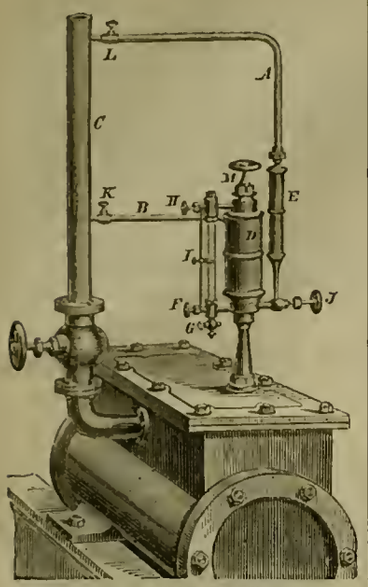
N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

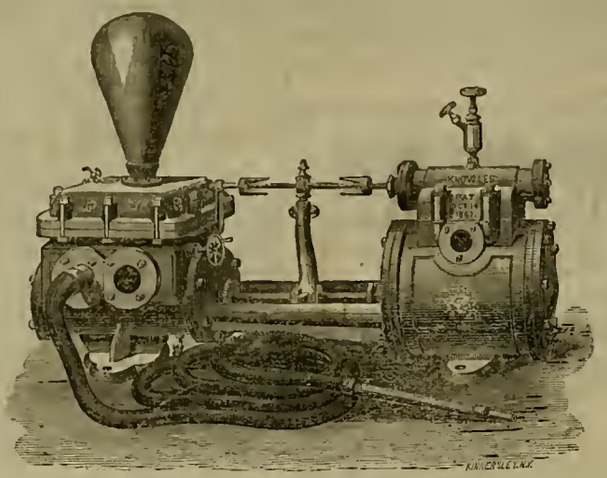
KNOWLES' PATENT STEAM PUMP.

Awarded First Premium and Diploma

Over all Competitors, at Mechanics' Institute Fair of San Francisco, 1871; also Special Medal and Diploma at State Fair.



It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.

The trial of Steam Pumps at the Eighth Industrial Fair in San Francisco, by a Committee of Five of the most thoroughly practical mechanics on this coast, showed the Knowles Pump to lose but 11½ per cent., while others lost as high as 40 per cent., showing great difference in economy.

CENTRAL PACIFIC R. R., OFFICE OF THE GEN'L MASTER MECHANIC,
SACRAMENTO, Cal., April 14, 1871.

A. L. FISH, Esq., Agent of the Knowles' Steam Pump, San Francisco—Dear Sir: In reply to your inquiry as to the merits of the Knowles' Steam Pump, in use upon this road, I will say that we have nineteen of them in use on this road as fire engines, and pumping water for shop and station use. I consider the Knowles Steam Pump the best in use, and prefer it to any other. Yours truly, A. J. STEVENS, General Master Mechanic.

WE BUILD AND HAVE CONSTANTLY ON HAND

THE LARGEST STOCK OF PUMPS IN THE WORLD,

And for Every Conceivable Purpose.

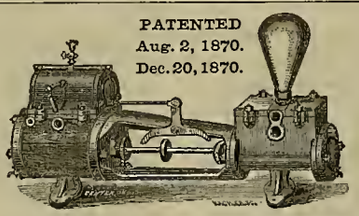
PATENTED
Aug. 2, 1870.
Dec. 20, 1870.



Combines Simplicity and Durability to a Remarkable Degree.

Its parts are easy of access, and it is adapted to all purposes for which Pumps are used—especially Mining.

Full description in *Scientific Press* of August, 1871.

Catalogues sent on application.

A. CARR,

43 Cortlandt Street, New York.

AGENT WANTED for Pacific Slope. 7v23-1y-eow

THEODORE KALLENBERG,

MACHINIST,

and Maker of Models for Inventors. All kinds of Dies, Stamps and Punches made. Also, all kinds of Small Gears Cut.

Repairing done on very Reasonable Terms and in the best manner. No. 32 Fremont street, S. F. 19v23-3m

Miners' Foundry and Machine Works,

CO-OPERATIVE,

First Street, bet. Howard and Folsom, SAN FRANCISCO.

Machinery and Castings of all kinds. 7v23tf

Metallurgy and Ores.

RODGERS, MEYER & CO.,

COMMISSION MERCHANTS,

ADVANCES MADE

On all kinds of Ores, and particular attention PAID TO

CONSIGNMENTS OF GOODS. 4v16-3m

Richardson & Co., Copper Ore Wharves, SWANSEA.

RICHARDSON & Co. have been for thirty years established in Swansea as Agents for the preparation, Sampling, Assaying, and Sale of Copper, Silver, Gold, Lead, Zinc, and all other Ores and Metals, for which they have extensive Warehouses and Wharves under cover, 1,000 feet of Quay Frontage within the Floating Dock, and the most complete Machinery and Appliances. They are also prepared to make advances against Ores in anticipation of realization, and to guarantee all payments when required. 5v22-1ys

LOUIS FALKENAU,

STATE ASSAYER,

Analytical and Consulting Chemist,

421 Montgomery St. up stairs.

Particular attention given to the Analysis of Ores, Minerals, Metallurgical Products, Mineral Waters, Soils, Commercial Articles, Etc.

One or two pupils can receive theoretical and practical instruction in Assaying, Analysis, or any particular branch of Chemistry at the laboratory. 11v21-3m

LEOPOLD KUH,

(Formerly of the U. S. Branch Mint, S. F.)

Assayer and Metallurgical CHEMIST,

No. 611 Commercial Street,

(Opposite the U. S. Branch Mint),

SAN FRANCISCO, CAL. 7v21-3m

NEVADA METALLURGICAL WORKS.

19 and 21 First st., in Golden State Foundry.

RIOTTE & LUCKHARDT.

Ores Crushed, Sampled and Assayed.

Having added Pans, Assay office and Chlorination Apparatus to our establishment, we are now prepared to make working tests by any process, assay ores and products. Returns guaranteed. Answers to all metallurgical questions given. 26v21-3m

CALIFORNIA ASSAY OFFICE

No. 512 CALIFORNIA STREET,

AMBLER'S BLOWPIPE FURNACE,

For Roasting Rebellious Ores.

This new roasting furnace is the CHEAPEST AND BEST yet offered to the public. By furnishing an ample supply of oxygen to the ore while roasting, thorough oxydization of the sulphurets is secured at a small cost.

It is Adapted to All Kinds of Ores.

A description and illustration of this Furnace was given in the SCIENTIFIC PRESS of November 25th.

For terms, circular, and further information, address the agent of the inventor,

MONROE THOMSON,

At 444 California street, San Francisco, until further notice. 6v23-3m

The Scientific Press is the Oldest and Largest Practical Mining Journal in America.

Established in 1860, this weekly has steadily advanced in size, ability and interest. Its chief editors and publishers have had over fifteen years successful experience in conducting this and other journals in California.

Its editorials are carefully prepared with an honesty and accuracy that maintains its reputation as the best authority on mining matters in the country.

It is published in the best location in the world for furnishing the largest amount of valuable information to the gold and silver miners and metallurgists everywhere.

Its correspondents and subscribers are to be found in nearly all the mining districts of CALIFORNIA, NEVADA, IDAHO, MONTANA, UTAH, ARIZONA, COLORADO, and in MEXICO and other foreign countries.

Over 10,000,000 Dollars!

Have doubtless been saved to the miners of the Pacific Coast by reading this journal, each issue of which contains some two pages of MINING SUMMARY from the most important districts in the U. S.; from one to two pages concerning NEW INCORPORATIONS, SHARE MARKET. MINING CORRESPONDENCE, COMMUNICATIONS, etc., and from two to three pages of EDITORIALS (with illustrations) of NEW MACHINERY, NEW DISCOVERIES, PROCESSES, and operations in MINING, MILLING, ROASTING of ORES, ASSAYING, etc.

One feature of our journal consists in presenting in each issue a POPULAR VARIETY of highly interesting matter, useful and instructive for all intelligent readers, systematically arranged in departments under headings entitled Mechanical Progress; Scientific Progress; Mechanical Hints; Home Industry; New Discoveries; Good Health; Domestic Economy, etc., rendering its reading pleasant and profitable at the OFFICE, SHOP AND FIRESIDE.

Yearly subscription $4 per annum. Single copies 10 cents. Four sample copies (of recent dates) furnished for 25 cents. List of California mining books sent free. DEWEY & CO., Publishers, Patent Agents and Engravers, No. 338 Montgomery street, San Francisco.

DEWEY & CO.,

SCIENTIFIC PRESS

U. S. AND FOREIGN

PATENT AGENCY.

The principal Agency on this side of the continent. Established in 1860. Inventors can rely upon the surety and dispatch of all important and confidential business intrusted in our hands. Long familiarity with Mining, Farming, and all other classes of inventions on this coast, enables us to give the most intelligent advice to PACIFIC COAST INVENTORS of any Agency in the Union, and oftentimes much unnecessary delay and expense. Every branch of the patent soliciting business attended to. All WORTHY INVENTIONS patented by us will be liberally noticed, free, at the most desirable time for the patentee, in both the SCIENTIFIC PRESS and the PACIFIC RURAL PRESS.

Send for our 62-page illustrated PATENT CIRCULAR, mailed free on receipt of stamp. Also the U. S. Patent Law of 1870.

DEWEY & CO.,

No. 338 Montgomery st., S. E. cor. California st., diagonally across from Wells, Fargo & Co., S. F.

ENGRAVING ON WOOD DESIGNING AND ENGRAVING on wood and for electrotype cuts of every description, done by superior artists at the office of the SCIENTIFIC PRESS. Fine Cuts made for Book and Newspaper Illustrations, and for Fancy Labels for printing in various colors; Monograms, Seals, etc., etc. Prompt execution and reasonable prices.

COMPLETE VOLUMES

Of the SCIENTIFIC PRESS can be had from January 1, 1864, to date, at $3 per single vol. or $6 a year. They afford the cheapest and best information on mining and the industry of this coast of any work published.

Also—Bound volumes of the PACIFIC RURAL PRESS furnished at same rates from its commencement.

THE GIANT POWDER COMPANY

Are now manufacturing besides the famous regular

GIANT POWDER, A NO. 2 GIANT POWDER,

Somewhat slower in its Explosion, which we recommend for

BANK BLASTING, COAL MINES,

AND FOR ALL SUCH WORK WHERE THE ROCK IS NOT VERY HARD

It is fully as safe as the other and evolvee neither smoke nor noxious fumes when exploded.

Price. 50 Cents per Pound.

The sales of both grades increase very fast, which is the best proof of their superiority over other explosives.

BANDMANN, NIELSEN & CO.,
General Agents, No. 210 Front Street.

20v22-3m16p

ft is one of the Largest, best Illustrated and most Original and Enterprising Agricultural Journals in America, and has no rival on the western side of the Continent. Its circulation is Rapidly Increasing, and it is Very Popular with its Patrons.

A NEW HUSBANDRY,

as it were, is required on the Pacific Coast, on account of its peculiar seasons, soil, climate and topography. The new discoveries, ideas, and useful hints evolved in its rapid progress, are to be observed with interest, and read, as reported in the PACIFIC RURAL, with profit by practical and progressive agriculturists everywhere. Sample copies of the PRESS, post paid, 10 cts. Subscription, $4 a year.

THE FACTS!

There appeared in the SCIENTIFIC PRESS of February 10th and 24th, 1872, over the signature of Treadwell & Co., an advertisement of the Blake Steam Pump which reads as follows: "The Blake Pump was awarded a Silver Medal at the last Exhibition of Mechanics' Institutes, San Francisco, and State Fair at Sacramento, as being the best Steam Pumps on exhibition;" which, permit me to say, is a LIE, and BERRY & PLACE know it.

The Official Report, Class 7, Page 63, of the last Mechanics' Institute Fair of San Francisco reads in this wise: "In the forcgoing trials it appears that the most efficient Pump on exhibition is the Knowles. The workmanship on this Pump is also very good. We would therefore recommend that this Pump receive a Silver Medal. Diploma awarded."

(*Signed by the Committee.*) OEO. W. DICKEY, H. B. ANGELL, CHAS. R. STEIGER, W. EPPELSHEIMER, MELVILLE ATWOOD.

The Knowles Pump was awarded a Diploma and Silver Medal at the last State Fair at Sacramento.

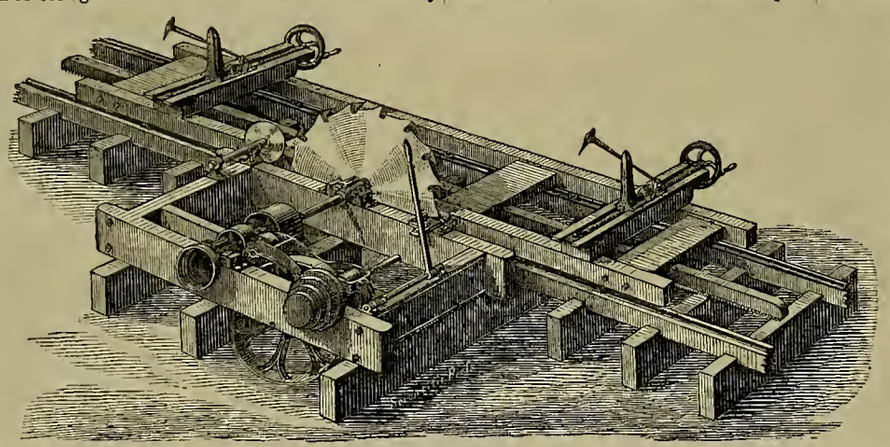
VOLUME XXIV. Number 10.

An Improved Portable Sawmill.

Onr illnstration represents one of F. A. Huntington's improved portahle sawmills, which is made so as to ba conveniently moved from placa to place as tho exigencies of lumber supply may require. It is a California dovico which fills a want in machinery for tha pioncer districts of this Coast which cannot he enpplied by Eastern manufacturers. In mountainons districts theso mills are very dcsirable, for as a general thing it is much easier to move the mill to tho timber, than the timber to the mill, nnless of conree, the location is by the side of a stream which furnishes snfficient water to floet down loge. It is the more deeirahlo on this coast from the fact that in those portione of the mountains where eufficient enow falls for eledging it nsually liee in too great depthe and of too saft a nature to admit of continued eledging, there being comperatively few freezing daye throughout onr mild winters. Our streams are very low in eummer and nnmanagahlo for floating timher during most of the winter.

Many of our early California towns were built elmost entirely of shakes, which are now largely resorted to where lumher is difficult to procnra, and where these portahle machines are then very useful in furnishing the neceeary floaring, etc. A mill of thie kind may he run either by eteam or horse power es may be deeired.

They are hnilt in the etrongest, most durahle and workmanlike manner, and are capahle of driving any eize eaw up to 64 inches. They are furnished with improved friction feed and gig back, hoth heing operated by the eame lever, no bolt heing used to gig hack. The capacity for cutting is from 8,000 to 12,000 feet per day witb 15-horse power. They are holted together so as to he easily teken apart for transportation and may he set again with equal facility. Mr. F. A. Huntington, tbe maker, No. 18 Fremont street, in this city, also builds steam engines, planing mills, lath and picket macbinee, shinglo machines, etc., a cless of home manufactures very deeirahle on this coast where lumher is eo plentiful and good. His ehingle machines are not excelled by any in practical use in the United States (or the world even), so far as we are informed.



PORTABLE SAWMILL.

THE MINING CORPORATION ACT.—Information is desired as to what has hecome of the Mining Incorporation Bill, which passed the Assembly eome weeks since. Ite long rest is ominous. Is there any ohjection to giving the partial protection to stockholders, which this bill contemplatee?

THE new iron draw of the bridge across the Mississippi river at Winona, Minnesota, is said to be one of the longest draws in the world, heing 360 feet in length.

AN ACT TO ENFORCE THE RESPONSIBILITY OF STOCKHOLDERS.—A hill was introduced into the Assemhly on the 17th ult., hy Mr. Gray, which is designad to enforco the reeponsihility of etockholdere in corporations ae preecrihed by the constitution and to provide for the prompt payment of demands againet euch corporations. It provides tbat oach etockholder of an incorporation created under the general laws of thie State, shall be held individually response for his proportion of all ite dehte and liahilitiee according to the amount of stack held by him; the term, etockhalder, applying not only to euch persons as appear hy tbe hooke to he such, but aleo to every equitahle owner of etock although the same may appear on snch books in the name of anothar person. This applies to guardians of minors and elso to avery guardien or other trustee who voluntarily invests any trust funds, euch funds not being liehle under the provicions of the Act, hut the guardian or otber trustee making the investment, to he held reeponsihle as a stockholder nntil such responsihility devolves upon the person heneficially interested therein, hy reaeon of their hecoming competent and ahle to control and diepose of the seme. In reepect to etock held by a guardian or other trustee, under a transfer hy a third person or his ordere, the person giving the directions shall he reresponsible, with certein exceptiane.

WATER RIGHTS.—A publio meeting was held at Placerville on the 23d ult., wbere resolutions were passed requsting the Legislature to define "water rights," wbich, when held in accordance witb judicial decisions and local laws and customs are declared by Congress to he vested rights, which must be protected. Parties have in many places claimed water with an avowed purpose of nsing it for mining or agricnltural operations and have made no use of it, while others, who really need it are afraid to appropriate it for fear of litigation. The terme should he clearly defined and partiee who bave a nominal ownerehip, be reqnired to make use of tbe water aacording to law or release their title to those who need it.

The Geological Survey.

The hill providing for tho continuance of the State Geological Survey for two years, and appropriating the sum of $2,000 per month to carry it on, which hed previously peesed tha House, paseed the Senate on the 4th inet. by a vote of 36 to 2. The final pessage of thie important hill ie highly gratifying to all scientiets on this Coast and elsewhere, as well as to every intelligent men who desires the dissemination of useful iaformation. We have freqnently commented upon the practical utility of the Snrvey, and its importance to the miners and agriculturiets as well as to the ganeral puhlic, for the reason that it is an earnest investigation hy ahle breins and skillful hends, of the materiel resonrces of the State. The maps now in hand will he worth much more to the people than the value of the appropriation, and the work done upon them wonld have heen lost if the Survey hed not heen carried on.

The Governor will no douht eign thie hill, as the almost unenimous vote by wbich it paesed, fairly represents the wishes of tbe people. Professor Wbitney and hie ahle corps of aesistants have labored assiduouely in carrying out the plans of the Survey and their work speeks for itself. When the map representing the extent and location of the auriferous gravel beds of this State is given to the public, that alone will prove the value of tbe Survey and the amount of work accomplisbed. The continuance of the Survey will increase the stock of scientific knowledge and benefit all the people of the State.

AN ARIZONA mining expedition is being organized at Denver, Col., under G. W. Graham. It ie to he under military rnlee, each memher furniehing a hreech loader, and revolver; 50 pouuds of haggagé allowed.

A MANUFACTORY of epools in Foxcroft, Maine, employs 50 hands. The company recently hought 1,200 acres of timber to convert into spoole.

California Academy of Sciences.

The regnlar semi-monthly meeting of the Academy was held on Monday evening last, Professor Kellogg in the ahair. Several new mambere wore propoeed. A letter accepting the Presidency of the Academy wae received from Prof. Georgo Davidson. A nnmber of

Donations

Were made to the lihrary, among them a Germen pamphlet on the suhject of Australian ants, and several communicatione on scientific euhjecte. Mr. Hanke preeented to the cehinet a fine specimen of brown jasper teken from a large vein of the same material in the neigbhorhood of Murpby's Camp. He aleo presented a specimen of tourmaline.

The Transit of Venus.

Communications were received from Prof. Davideon and Rear-Admiral Sands of the National Observatory, in relation to the neceseity of Congressionel appropriaton for ecientific ohservations of tbe trenseit of Venns across the disk of the snn, which will teke place in 1874. The principal European Governments have teken eteps in the matter, and the United States ehould aleo coöperate in a work so important to aetronomical science. The eecretary stated thet he had elready succeeded in getting a number of eignatures of prominent ecientiets on thie Coaet, asking the necessary eppropriation. Tbe Preeident and Secretary were authorized to sign the memorial for the Academy.

Shell Mounds.

R. E. C. Stearns gave tbe reeult of his ohservation of the numeroue ehell mounds in Florida, particularly in the neighhorhood of De Soto's supposed landing, where there were two clesees of mounds, earth mounds and shell mounds. The earth or burial maunds contein hut few ehells. The sbell mounds were compoeed of alternate layers of shelle and aehes, wbich alternation he eccounted for by the periodical visite of the Indians end their burning of gress, and then throwing over freeh deposits of shells. In connection with thie he incidentally investigated the euhject of the reported ahundence of pearls in Florida in the fresh water mollusks which are referred to in the works deecriptive of the visits of De Soto. His experience was to the effect that the fresb water mollusks yielded no pearls of eize or value. In the earth or hurial mounds he found arrow heads of cbalcedony and fragments of pottery.

Dr. Gihbone gave the views of a writer wbo advanced tbe tbeory that tbe mound worke being similar ovor the world, their origin ebould be attributed to the eame race. Mr. Wetmore referred to eome interesting developmente made in tbe ehell mounds in South America. Judge Hastings also spoke on the same subject.

The diecussion of tho subject of aerolites wae postponed until next meeting, and the Academy adjourned.

CORRESPONDENCE.

Mining at West Point.

EDS. PRESS:—West Point is in Calaveras Co., California, a quartz-mining town between the Middle and North fork of the Mokelumno river, eastward from Mokelumne Hill, and 16 miles by stage road; its olevation is about 2,800 feet above the sea. The climate is good and but little snow falls duriug the winter season. The bed-rock is granite, the lodes are narrow and in most cases rich in gold and sulphurets, and are fonnd to increase in width as they go down to the depth of 100 to 300 feet. Mining and milling at one time seemed to be two separate occupations, but of late they work to much better advantage conjointly. This section of country has been worksd by Mexicans, who, as a general thing, hunt for rich pockets and those near the surface. They seldom go deeper than 50 feet, and when they find water or blasting ground they give up the claim and go after new deposits. In early days there were upwards of 100 men engaged in this class of mining as their regular business.

Quartz Mines.

In the neighborhood of West Point there are quite a number of good quartz mines being opened and prospected, some of which have besn idle for years until this season, one great advantage bsing that most of them can be worked and put in a paying condition with a small outlay by the owners.

Last summer the little town of West Point was extremely dull and the storekeepers wero anxiously looking for some one to purchase their goods, but now a change has come; the blacksmith has plenty of work and the stores have orders for miles around, which keeps them busy packing their goods to the newly opened mines.

Since the advent of A. Bateman, Esq., who took hold of the splendid property known as the Zacetara mine, at Skull Flat, and made it a success, it seemed to have inspired others with confidence that West Point will soon come out, redeem itself, and take its stand among the prominent quartz districts of the State.

The Bartolo Mine

Being superintended and worked by the energetic J. A. Lefoy, Esq., stands well, and will be a good property. The record of this mine is extremely good. It is being worked by shaft.

There is also the

Paine and Mexican Mine,

One and a half miles from West Point, which has a good reputation aud is being opened by means of a tunnel, and which promises to soon show some rich devslopments. This mine is to be worked by a San Francisco company.

We are in hopes soon to see the famous

Billy Williams Mine

In working order, it having been lying idle for some time. This mine has a tunnel in to pay rock, the ledge showing ore of a first-class character of from 13 inches to 2 feet in width, and will only require a small outlay to make it a paying institution. It is situated one mile from the Zacetara mine.

We were told of a new location a short distance from town on the North Fork of the Mokelumne river known as the

Woodland Mine.

It was discovered by Mr. Geo. L. Swan of this place, and purchased, and worked by a San Francisco company; it makes a good showing. They have a tunnel in 100 feet with good walls and a well defined ledge; they have passed over two chimneys which carry paying quartz in quantity. The ore shows free gold in small quantities, and will all pay a handsome profit for milling. The dump pile shows from 40 to 50 tons of good ore.

The Eagle Mine,

Just across the rivor, which is the dividing line between the two counties, is a good paying property. Mr. J. B. Pine is superintendent and owner with parties in San Francisco. This mine has been worked by Mexicans in years past, who did not go deep or through the hard granite rock, and as they were discouraged with the result, Mr. Pine purchased the mine aud continued the tunuel through the hard granits, aud is now in some 280 feet with a fine ledge of 3 feet in width showing rich sulphurets and free gold. Thc last crushing made about the 1st of February resulted in a clean up at the rate of $65 per ton. This mine has a 10-stamp mill on the bank of the river which is run by water power. The ledge on which the Eagle mine is located has besn traced across the Mokelumne into Calaveras county for a distance of four miles, and the Woodland mine spoken of above is considered to be on the same ledge as is also the Harris mine.

Then there is the Brown mine on the same side, which is being worked by a San Francisco company, and bids fair to be a good investment with a small expenditure of money; they have a well defined ledge of 2½ feet which they are working through an open cnt.

The mining laws of West Point give 200 feet on a vein to a claim and require one days work every month to hold it.

"CROOKS."

West Point, Feb. 21.

Ophir, Utah Territory.

EDITORS PRESS:—In every issue of the PRESS I notice items gleaned from the Salt Lake *Tribune* treating on the different districts of this Territory, Ophir getting its share of notice of course. But I seldom see an Ophir letter. In behalf of the intersst of your many readers who have never visited this camp,—minsrs, those who have interests here and others—I will give a description of

Oquirrh Range

And its districts. Oquirrh is a district range, though only abont 50 miles in extent, flanked with the Wahsatch range on the east, and the West mountains on the west; with 20 miles miles width of valley intervening on each side.

To convey to the reader a more definite idea of the location of the several districts aud towns, I will make Salt Lake City the starting point. Leaving the city from its west side, crossing over Jordan bridge, and continuing in a southwesterly direction for 13 miles, brings us to Chambers's place, at the north end of the mountain; 3 miles of up grade now brings us on the west side of the range and in full view of Great Salt Lake—a few more miles and the town of "E. T.,"—thence to Tooele, (dinner station), the county seat of Tooele county, distance from Salt Lake City 28 miles. Up the Cañon back (east) of the town is Tooele district; no mining of consequence is going ou here. On tho east side of the range, nearly opposite to this district, is Bingham Cañon; distance from Salt Lake City about 27 miles; direction south, and the only district on the west side of ths range. From Tooele a few miles and we lose sight of Salt Lake, but only to come in view of Stockton Lake; to Stockton, 10 miles. All of this distance by the old overland road, and all the way quite picturesque. Stockton is a pleasantly situated town; its smelters and hardy men give the first evidence of a mining town community. It is one of the oldest, if not the oldest district in the Territory. They have apparently well defined ledges, though generally low grade. From here we go up, up, up past the mouth of Dry Cañon, to East Cañon 9½ miles. Here we encounter mills, smelters and arastras until we reach

Ophir,

Two and one half miles further np. Ophir is a mining town, but includes among its 450 inhabitants some very fine families. This district takes in three cañons: East, Dry, (on the north) and Silverado (on the south side). It contains more mines, and in a greater variety, than any other; but having been struck, as they were, by a class of poor and inexperienced miners, it is sadly wanting in development, yet many of the mines are developed sufficiently to prove that we have defined leads and vast bodies of rich ores.

I will mention some of our mines at another time. In

Dry Canon

Some very good mines are opening np. Several heavy companies are carrying on miniug to quite an extent. Some of our best base and best chloride leads are here.

On Silverado Hills

Have been found the richest ores in the country; though, as is usually the cass, they have not extended to any depth; there is now, however, a chance of an exceptiou to this rule, as one of the Silverado mines abouuds in hornsilver at the depth of 50 feet. Six miles from Ophir brings us to

Camp Floyd

District, which also abonnds in rich ores. There is another small district at the terminus of the range. These cañons all cut the range at a right angle and run up in an easterly direction.

The Mineral Belt.

From the extreme sonth nearly to the north end, seems to be a continnons mineral belt varying in width from 1 to 4 miles. From the middle of the south end of the range wood is plenty, and will be for years to come, for all milling and smelting purposes. Up the cañon a few miles above Ophir, is plenty of lumber of fair quality. Water is plenty and very good. Thus, you see, Nature has anticipated and kindly supplied our wants.

Our mills and smelters are nearly all closed at the present time. Walker Bro.'s mill has a large qnantity of ore aud wood on hand and contemplate a long run. The English Company are making preparations for a heavy season's business, judging from indications.

Old winter has been very severe, bnt its white locks are growing "beautifully less" and he is dying a uatural death.

LUDLOW.

Ophir, Feb. 21st.

Banner District, San Diego County.

EDITORS PRESS:—A few items from this place may be interesting to the readers of your journal. The present actual mining population is abont 150. There are three quartz mills, two of them run by steam power and the other by watsr. There are two boarding houses, three stores and three saloons. Ten mines are at present taking out quartz, and a number of other Cos. are sinking shafts and running tunnels. Cordwood is worth $3.50 and $4.00, delivered at the mills; mining timbers, 12 and 22 cents per lineal foot delivered at the mines; lagging, 14 cents each, delivered. Lumber scarce, $60 and $70. They charge at the mill for crushing rock $7 and $10 per ton. There is plenty of water all the year round for milling purposes.

The Mines.

The Golden Chariot mine has let a contract to sink a shaft 100 feet deep; I do not know the figures. This Co. is having 45 tons of rock worked at the McMechan mill which is expected to pay largely; the last rock worked from this mine paid $182 per ton.

The Redman Co. have leased the Bailsy mine and have a force of men getting out rock, which will keep the mill running steadily. At the Kentuck mine ths ledge looks well at present, the last two crushings averaged about $50 per ton.

The Madden mine is producing better rock than at any previous time since its discovery.

The Antelope Co. struck the lsdge in the cross drift two days ago; the quartz looks very well, and a wide vein is in sight.

The tunnsl of the Big Blne Co. was in yesterday 280 feet. There has been 50 or 60 tons of rock worked from this location, paying $112 per ton; there is no defined lead, but bodies of quartz here and there in pockets and nodules, apparently having no connection and lying in all conceivable shapes. It is possible these nodules are all from one chimney, but it has not yet been found.

Wilson's steam stamp mill started up day before yesterday, and works admirably.

QUARTZ.

Our Mines on the London Market.

The *Alta* takes the following extract from a private letter written by a gentleman who left here for London early in December last, with the intention of placing one of our California mines on the English market:

"I had on reaching London (on the 3d,) first-class letters of introduction to many of the leading honses in the mining business, and after making inquiry I decided not to use a number of them, as this kind of investment is in snch bad odor that it is rather throwing away weight to make use of people who do not understand that some of our American mines are not swindles. I set to work as soon as possible, explained all, and gavo the whole affair as good a character as I could, but fouud plainly in about ten days that this mine business is so utterly run into the grounds in London, and such an outrageous amount of swindles passed off of late, that it was sheer waste of time to try it any further. I had from excellent authority that pressing the matter now would be useless, as people would not touch American mines on any account.

"We were jnst two months too late. Some man in particular has floated quite a number lately, many of which are quite worthless. People are not only shy but indignant, and you see a broad grin stealing ovor their faces when you mention the word "mine." In fact, I think I could at present sell the most barren portion of the Sierras for Agricultural purposes more easily than the best mine on the Pacific Coast."

Characteristics of Mineral Veins.

Prof. Smyth in one of his recent lectures before the Royal school of Mines in London, remarked as follows:

One of the most important questions connected with the deposit of minerals in true lodes is whether the country or rocks in which they occur produce any effect on their metallic character. If we take the opinions of the most practical and observant miners of different districts we shall find that they lay stress not only on the facts that ores of particular sorts are found in certain rocks, but much more than that, for they say that ores in abuudance are to be met with more frequently in certain varieties of those rocks. Thus, it is not enough to say that a rock is granite, but rather what is its physical condition, and in that respect granite is extremely variable. Again, it is important to know whether particular classes of rocks have bsen more subject than others to open and admit the miuerals introduced into them, or whether the agencies by which the minerals were introduced may themsslves have produced the changes observable in the containing rocks.

Most of the crystalline or igneous rocks contain ores of one sort or anothsr, aud also that granite is most noticeable of all, as being, as it were, the great parent of tin ores, and as contaiuing not unfrequently gold, silvor, copper, lead, antimony, and iron. If we look at the geological map of Cornwall and Devon we shall see great bosses, as it were, of granite protruding from the clay-slate, and that all the more important groups of mines occur very near (that is, within two or threo miles) to the edges of these granite bosses. Of course, there are exceptions, but even in those cases it may bs the granite is not far off below, although it is not seen at the surface. There was a not uncommon impression years ago, and indeed it is held by some persons even now, that granite is unfavorable to copper ore; but there are many notable examples of very important copper mines in ths granite, and that opinion, therefore, is not of much value.

As to tin, there is no doubt but that the larger portion of the mines for that metal are in the granite or its immediate neighborhood; and in some cases, where the shafts are sunk on the killas, they reach the granite in the depth below. Schist, mica-slate, and olay-slate are all rocks yielding ores in large quantities of different kinds. Limestones are extremely prodnctive of lead ores. Limestones also are productive of silver ores in Chili and South Australia, and are noted generally in those countries for their argentiferous lead. In this country, however, the limestones in some districts are important as producing iron ores of an excellent quality; and, again, in Belgium and Westphalia they yield valuable ores of calamine. In Spain there are several valuable mines of lsad in a particular kind of limestones. Syenite; porphyry and greenstone are all worthy of a great amount of study, as in certain conditions they yield large quantities of valuable ores.

The character of a lode in the neighborhood of a crossing is frequently found to be greatly different from that which is found in other parts of the same vein, and it is worthy of mention that the rarest metals, snch as cobalt and nickel, as well as silver, are freqnently fonnd near these crossings.

JESSE MEYERS leaned against a shaft revolving three hundred times per minute, in a Muncy, Ind., slaughter-house. He was undressed in about ten seconds, but, strange to say, he was not at all injured. His coat, pantaloons, and vest were doubtless made of shoddy.

Scientific Progress.

Spiral Leyden Jar.

According to a writer in the *Philosophical Magazine*, a spiral Leyden jar may be constructed as follows: "A strip of tinfoil, four feet long, and eight inches wide, is placed in the centre of a strip of vulcanized caoutchouc four feet long, and one foot wide, in such a way that at one end (say the right) there is a margin of four inches of caoutchouc, and at the other (the left) four inches of tinfoil. A second piece of caoutchouc, of the same dimensions as the first, is placed over the tifoil, the ends coinciding with the first piece of caoutchouc. A second piece of tinfoil, of the same width as the first, but four inches shorter, is then laid on the second caoutchouc, with its right-hand end over the end of the first foil, its left end of course falling four inches short. A brass wire with a knob is laid across the end of the upper foil. The whole is then rolled up from the right end, and bound. What was the lower of the two foils projects between the two layers of caoutchouc, and may be prolonged around the circumference of the roll. It forms the outer coating, or earth surface. What was the upper coating of foil now corresponds to the inner coating of the ordinary jar, and is entirely covered, excepting when it is prolonged by the wire and knob at the centre of the roll. If the sheet caoutchouc be one-eighth of an inch in thinkness, a jar of very great electrical capacity is obtained."

An Astronomical Problem.—One of the greatest unsolved problems in astronomy in our era is the combined system of movements of the stars of our own sidereal system. It is worthy of the application of the highest talents and of the largest learning, and it seems to invite especially the devotion of young men who may make it their life-long labor. There are at least four aids and encouragements to undertake the work; first, the form of our sidereal system, which is a ring with an interior disk-like stratum, and both the ring and the stratum lie in the same plane; secondly, our position in the system, which, as already shown, is near the center; thirdly, the origin of the system and its motions, according to the nebular theory; fourthly, the present calculable influence of the stars on one another, such particularly whose distances are known.

The aid we may receive in the solution of this great problem, from our position near the center of our sidereal system, may be estimated by our relation to our solar system. How much more simple would the motions of the planets appear from a central point, like the sun, than from a half-way position, as on our earth! Knowing, therefore, our stand point in our sidereal system, we may put together the motions of the fixed stars with the more confidence and hope of final success in unraveling the great mystery of their intricate dance.—*Ennis.*

Estimation of Graphite.—F. Stolba communicates the fact that it is possible to determine, accurately enough for practical purposes, the percentage of carbon in commercial graphite by simple combustion in the air. He employs for this purpose a simple Bunsen burner, and announces that the burning of a few grammes of graphite is by no means so difficult as is generally supposed. The author places a weighed portion of the finely powdered and dried material in a platinum crucible, having a punctured cover. The crucible is placed over the flame in an inclined position, and the cover is placed so as to leave one-fourth of the same open. By this arrangement, by which a good draft is secured within and occasional stirring of the material, a few hours completes the operation, leaving the ash in an excellent condition for further analysis.

Marbleized Glass for Buildings.—It is not unlikely that a new building material will soon be introduced to the public, that promise to work quite a revolution in the style of buildings. A gentleman from New Albany has invented a plan for the manufacture of marbleized glass of such perfection of pattern and exact imitation that it requires the closest examination to detect it from genuine marble. This glass can be made plain, white or variegated, to suit any taste or requirement, the Louisville *Ledger* says, and can be made from one to two inches in thickness at the New Albany Plate Glass Works. It is claimed that for ornamental house fronts, floors or pavements, this marbleized glass is superior to marble in durability. It will maintain its colors, they being indestructible. A patent on this invention has, we understand, been taken out, and it is claimed that the great cheapness of this marbleized glass, as compared with marble, will bring it into general use for house fronts, floors and ornaments.—*Chicago Journal.*

Interesting Facts with Regard to Iron and Cadmium.—Dr. Schönn announces that the metal cadmium may, under certain circumstances, be rendered indifferent to the action of acids. It has long been known that iron, if plunged into acid of a certain degree of concentration acquires a peculiar surface condition, rendering it indifferent to the action of the strongest acid. Iron which has undegone this surface change has been termed passive. It appears, too, that such iron has acquired some peculiar physical qualities, since it will form a galvanic circuit with ordinary iron; the changed metal behaving electrically negative to the other. That such iron has really been decidedly altered in character is evinced again by the fact that it refuses to reduce copper from solutions of its salts.

It appears, from Dr. Schönn's observation, that if cadmium is wrapped with some platinum wire, it may be placed, without being in the least acted upon, in strong nitric acid; though if the wire surrounding is removed, or if the acid is diluted, the cadmium is instantly attacked, thus showing that the passivity of the cadmium is due entirely to its contact with the platinum. The same author has shown that tin will give the same phenomenon.

Consumption of Smoke.—At the November meeting of the Scientific and Mechanical Society of Manchester, England, the discussion turned on smoke-consuming furnaces. After a thoroughly scientific *expose* of the generally accepted theory of smoke-consumption, and of the hundred and one inventions, self-acting and otherwise, that have been applied for this purpose, the practical experience of the members was brought to bear upon it. Self-acting apparatus was voted to be of no practical use whatever. The system of admitting air behind the bridge found a few supporters, but after being brought to the test of experience, even with all its appliances of hollow fire-bars and perforated bridge, its advantages were found to be very doubtful. The opinion of the majority of the members was, that a short dead plate, with perforated fire-door, and an efficient stoker, is the best smoke-consuming apparatus extant, and coupled with plenty of boiler power, to avoid forcing the fires.

Action of Light on Cane Sugar Solutions.—M. Raoult communicates the fact that a solution of cane sugar may be converted into grape sugar (glucose) under the influence of light. The observation was made in the following manner:

A concentrated aqueous solution of cane sugar was placed in glass tubes, which were sealed while their contents were boiling. These were placed near each other, under the same conditions, with the sole difference that one was kept in total darkness, while the other was exposed to the bright daylight. Several months later the tubes were examined, when both solutions were found, under the microscope, to be free from vegetable matter. The solution, however, which had been in the light, at once gave an abundant red precipitate with a copper salt on addition of a free alkali (the test for grape sugar); while the contents of the tube kept in the dark, gave no sign of the reaction.

Gas Pokers.—It is only quite recently that anything has been done to obviate the trouble invariably attendant upon kindling fires. Various fire kindlers, such as cakes of rosin and sawdust, etc., have been introduced, and found very serviceable: but the latest and most original effort in this direction is a "gas poker;" simply a hollow iron tube, shaped like a poker, with perforated holes in one extremity, and the other arranged with a flexible tube, of sufficient length to connect the "poker," when thrust into the stove or grate, with the nearest gas burner. This done a match will light the gas, and in a few minutes you have a fire, whether of wood or coal, without any trouble or litter. Any kind of coal but anthracite may thus be readily lighted. For city use, or where ever gas is used this is the simplest and most effective idea yet brought out.

Mechanical Progress.

Wood Carving by Machinery.

There seems to be no limit to the adaptability of machinery to the arts, whether for manufacturing or decorative purposes. For machine carving several different processes have been devised; none of which appear to be so simple or really artistic as the one latest announced, the object of which is to impress upon wood, by charring it, any design however elaborate. This process may be described substantially as follows:

This object is effected by engraving the design upon the face of hollow iron cylinders, the lines forming the design being left raised as in wood engraving. According to the kind of work required, the cylinders vary in size, from a diameter of a few inches to above two feet. The cylinder is fixed on an axis, and adjusted by means of screws and a lever to the proper distance from another cylinder, which is not engraved. To make this adjustment correctly and to secure the uniform rotation of the engraved cylinder, one end is closed, except the hole into which the axis is screwed and a few small holes to secure the free circulation of air. Two gas pipes are passed into the engraved cylinder; through one of these gas is supplied, and it is ignited, the jets being so placed that they play against the side of the cylinder. A second pipe, also perforated with holes in the sides, is supplied with air, by means of a rapidly revolving fan. By this means a powerful blast is urged upon the gas flame, and a most energetic blow pipe is formed. The gas flames, which played at first steadily against the side, now sweep with a roaring noise the interior of the cylinder, which notwithstanding the mass of metal, can be rapidly made red hot throughout by its action.

The cylinder being sufficiently hot a smooth board is pushed between the two cylinders and subjected to considerable pressure. By this the design, which is upon the roller, is pressed and burnt into the timber, every line being faithfully and deeply marked. Plank after plank passes on through the rollers in steady order, so that in a comparatively short time many hundred feet may be thus impressed with the pattern on the cylinder.

Where there is a continuous pattern, as for mouldings, the cylinder is small, and is, of course, with every revolution repeating itself. Where ornamented panels are required, the circumference of the cylinder is the length of the panel, and boards of the same length are regularly passed through, every one of them receiving a repetition of the pattern. The heat of the cylinder can be regulated with very great nicety, by turning the gas on or off, and by adjusting the supply of air to the blow pipe.

When the board has passed through the charring operation, it passes to the workman, who scrapes it down over the entire surface, so as to bring out the lights, and produce the best effects. When this is accomplished, the surface is varnished or polished and the result is an ornamental panel or moulding of the greatest beauty, and of remarkable permanence.

White woods, as sycamore and lime, are employed for this work. It is easy also, by this process, to give to the less expensive varieties of wood the peculiar characteristics of the more expensive kinds; rosewood and walnut are very excellently imitated, and upon these again any pattern can be impressed.

The advantages of this process appear to be the facility and cheapness with which we can place on wood the most artistic designs; it is not of course applicable to the production of a single specimen; but, where we have to repeat the same design, with every repetition the price is reduced. The beautiful sepia, or chocolate color, received by the woods employed in the process are especially pleasing.

Any person who has whittled down a piece of charred, fine grained, white wood, will at once call to mind the beautiful and variegated shades that can be readily produced by cutting more or less deeply into the charred surface.

A mixture of glycerine and litharge forms a durable cement, which will resist a temperature of 275°. It sets rapidly, and should be used immediately after mixing.

Fire-Proof Wood for Buildings.

The destructive fires of the year 1871 have directed public attention more strongly than ever before to the necessity of more secure provision against this danger in the construction of our dwellings, shops and stores. In the denser portions of large cities, a law forbidding the erection of frame buildings of any kind is manifestly just, and removes in a very great measure the liability to wide-spread conflagrations like that at Chicago. But in other localities in the suburbs of cities and towns, villages and rural neighborhoods, wood will continue the ordinary material for building, and people who choose it for economical or other reasons cannot be compelled, even were such a measure desirable, to adopt brick, stone or iron in its stead.

It is, therefore, a fact worthy of general notice that wood may be rendered, without great labor or expense, nearly as capable of resisting fire as brick or stone. This is done by soaking the dried lumber a short time in a solution of soluble glass, a silicate of soda or potash, after which it is immersed in lime-water, by which the silicate of soda is decomposed and the pores of the wood filled with a silicate of lime. This substance is fire-proof and cannot be dissolved in water, and its presence and effect in the fibre of the wood are, therefore, permanent. Soluble glass is readily obtained, being already largely used for various purposes in this country. There is no patent upon the process, and it can therefore be used by any builder or lumber dealer.

The comparative cheapness of frame buildings, in the erection of which the tastes of the owner as to style and ornament may be consulted with but a moderate tax upon his means, will maintain their popularity at least until some equally convenient and inexpensive material is discovered. A process by which their exposure to the ravages of fire can be remedied in so great a degree is of too great value to the community to be lightly overlooked.

Coating Metallic Objects With a Black-Brown Varnish.—On the bottom of a cylindrical cast-iron vessel, 18 inches high, is placed a layer, one-half inch thick, of coal-dust (bituminous of course); upon this is placed an iron grating, and thereon are put the iron, steel, or other metallic objects intended to be coated with the varnish. The vessel, having been first closed with a well-fitting lid, is next placed on a bright coke fire, and heated for about a quarter of an hour just to an incipient red heat. The vessel is then removed from the fire, and on the lid being removed, after about ten minutes, the metallic objects will be found coated very uniformly with a good and durable varnish, which resists bending, as well as a high temperature, without cracking or coming off. Very small objects, such as hooks-and-eyes for instance, are better placed along with some coal-dust in a coffee roasting apparatus, and this turned, as is usual in the roasting of coffee, until the metallic objects have obtained the desired depth of color and are uniformly coated with the varnish.—*Chemical News.*

A Buffalo man must have the credit for the most novel invention yet proposed for propelling boats on the canal. The power is not attached to the boat, but the entire body of water in the canal is moved, and the current thus created is used as the propelling power. The plan embraces a wall laid in the center of the canal its entire length, dividing it into two equal channels. At the head of each level is placed an immersed wheel of peculiar construction, which is moved by a stationary engine, and the action of which is to throw the water from one of the channels into the other. A current is thus created from the machinery in one channel, and toward it in the other.—*Artisan.*

A new safe has been invented which makes things very unpleasant for burglars. The walls are filled with gunpowder in such a manner that the blows of a sledge or the cutting of a chisel in the attempt to rob the safe will ignite the powder, blow off the outer crust, annihilate the burglar, and leave the contents of the safe uninjured.

The smallest steam engine in the world is said to be in Greenwich, England. It will stand on a three-penny piece; so small are some of the parts that they require a powerful magnifying glass to see their form. The whole weight of the model is less than three-penny weight. When working its crank shaft performs from twenty to thirty thousand revolutions in a minute.

MINING SUMMARY.

THE following information is condensed mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

MONITOR MILL.—Monitor *Miner*, Feb. 24: The Monitor mill is shut down for a few days, to give time for an investigation into the cause and hit upon a rsmedy for the great amount of iron in the amalgam.

AMADOR COUNTY.

MINE IMPROVING. — Jackson *Ledger*, Feh. 25: Work on the State of Maine mine is being vigorously carried on, and the ledge givss hetter evidence of value as work progresses. After the first of March the working force will he increassd, and the mine worked day and night.

WORLEY CLAIM.—The claim recently discovered near Drytown, is turning out remarkably well. The owners have erected hydraulic works with a fall of 110 ft. which enablss them to wash up a large amount of dirt daily. The pay gravel is now 5 ft., in depth, and pays largely.

PAUGH MINE.—Work is progrossing rapidly; in sinking the main shaft, a few days ago, the workmen came upon a body of very rich rock having the appearance of heing extensive and permanent. The ledge is well defined.

PHOENIX.—Very rich rock was struck last week hoth in the north levcl and bottom of the maiu shaft, now snnk to the depth of 600 ft. The ledge in hoth the shaft and level, is well defined, hut the extent not yet ascertained—7 ft. in width baving heen exposed without reaching the walls. The entire mass of rock recently discovered will yield at least $15 per ton.

ALPINE MINE.–Very ricb rock was struck last week, in sinking the main shaft; the shaft is over 250 ft. in depth, and the entire rock hetween the walls will yield, by ordinary mill process $20 per ton. The ledge is full 3 ft. in width.

UNION QUARTZ MINE.—Jackson *Dispatch*, Feh. 25: Work has heen resumed on this mine, situated on Jones' Bar on the Mokelumne river. The shaft is 60 ft. deep; at which depth the lead is 4 ft. wide and yields a prospect of $15 per ton.

CASCO MINE.—Work will soon be resumed on this mine, which is at Middle Bar on the Mokelumne river.

BUTTE COUNTY.

RICH STRIKE.—Chico *Enterprise*, March 2d: Some gentlemen from Chico while prospscting last week on the ridge South of the North fork of Butte Creek discovered a mineral deposit which prospected from 15 to 50 cts. of gold to the pan.

CALAVERAS COUNTY.

QUARTZ.—Mok. Hill *Chronicle*, March 2: We hear very favorable reports of quartz operations in Angels. A first-class quality of ore is being taksn from the Stickles mine npon which new machinery has recently been erected. The lead is looking tip top. A "clean up" was made this week, after a short run, and $1,400 obtained. The Big mins is also doing splendidly, the ledge showing better than at any other point in the shaft.

GOOD rock continues to bs taken from the Prussian Hill mine near Railroad. The ledge is steadily improving.

EL DORADO COUNTY.

ORR'S STATION.—Cor. Placerville *Republican*, Feb. 29: On the 25d ult. Romondo & Co. of Hogg's Diggings, took from their claim 3 nuggets, the largest of which weighed 92 ozs. The value of the nuggets was $1,719.

UNIONTOWN.—Cor. same: Steckslager & Co. are driving ahead at their ricb claim, and are shoveling out the dust. G. Kliеber is working ground that will pay well.

NUGGET.— A "Chinee," a few days since stumbled upon a lnmp which be sold to C. W. Brewster, last week, for $170.

KERN COUNTY.

Bakersfield *Courier:* The tunnel designed to reach and drain the Snmmer and Big Blue leads at the deep level, in Kernville, has been brought to completion.

LOS ANGELES COUNTY.

SHIPMENTS.—Los Angeles, Feh. 28: One hundred and forty two sacks of silver ore, received from the Clark dist. and over 2,000 bars of hase bullion, from Cerro Gordo are waiting shipment at San Pedro.

NEVADA COUNTY.

SCOTT'S FLAT. — Nevada *Transcript*, March 2: Merrow, Dean & Co., have made one run and cleaned up $1,400. They have the claims ahout clear, and will have bigger returns. Ashburn & Co. have their flumes nearly completed, and are washing.

LOCATION.—The Ivanhoe Co. have located 1,600 ft. on a quartz ledge, called the Knights of Malta ledge, in Grass Valley township.

SHUT DOWN.—It was reported yesterday that the North Star mine, at Grass Valley, shut down on Wednesday night.

GOOD PAY.—The claims of Roberts & Co. at Bunker Hill, are yielding over $10 per day to the hand, and they are getting hetter every day. The yield during the last 10 days has heen about $600.

BLUE TENT.—The Sailor Flat Co. is working day and night. They are washing off a large amount of gravel.

Belden & Co. are working day and night.

Killham & Co., have a prospect for a splendid season.

EUREKA.—The Eagle Co. has heen running powder drifts this winter.

The Illinois Co. has bsen washing at intervals during the winter, and the resnlt has been flattering.

Atwater & Knotwell's claims bave not been worked during the winter. This is a good mine, and it is reported that a tunnel is soon to be run to give sufficient fall for working.

The Boston mine is at Woolsey's Flat, and has been worked continuously during the winter with excellent results. A large force will be employed in the spring.

The Blue Bank Co. bas not heen worked dnring the winter, except the running of a bed rock tunnel, the work being done ou contract by Rich and Blight.

The X. I. X. claim, has been unworked for some time, in consequence of a large cave wbich filled the diggings with clay.

The Narrow Road will be worked in the spring.

Orleans Flat is improving; 2 sets of claims have heen worked during the winter.

Kleese & Co. have "cntting up fall," and Johnson & Co. have been sluicing.

The Canadian quartz mine, on Wolf Creek, has heen doing well during the winter, making some splendid runs. One of the finest 8-stamp mills in the county, run by water power, is on the mine. It is reported that this mine was sold to an English Co. two weeks ago for $120,000.

THE SITUATION.—G. V. *Union*, March 1: Eureka mine bas considerable trouble with water. Sinking the shaft continues with all possible energy, and it is down 965 ft. from the surface. The mill has heen runuing with 15 stamps, but the gold yield does not pay the expsnses of the mine. Idaho mine never looked hetter at any time in its history. It is paying largely and regularly. North Star is put to all it can do with its very large pumps to keep the water down. The ore coming ont is very good. Empire mine, on Ophir Hill, has not been paying for several mouths. Knight of Malta mine has made a contract hy which machinery for prospecting will he put up and started at a very early day. Perrin's miue is in good rock with a 2 ft. ledge. The Coe is pumping to keep the water out. It is said that a contract will be let to-day for taking out rock. The last ore that came out of the Coe looked well. Henston Hill is being worked by 13 practical miners, who take out trihute. They are getting out splendid ore. The good rock comes from 150 ft. on the incline and will pay about $100 to the ton. Defiance is heing rapidly opened, and is showing well. Daisy Hill is the promising mine of the dist. Not a crnshing from this mine but has paid well. The ledge is large and shows free gold and sulphurets.

CHISPA.—Last Friday W. Pierce, who was engaged in sluicing near the Daisy Hill mine, found a lump of gold weigbing 2 ounces.

GOLD BRICKS.—We saw yesterday at Findley & Co.'s Banking House, 2 gold bricks, of the value of $17,000, the result of 2 weeks run of the Idaho mine.

DEER CREEK.—Grass Valley *Republican*, Feb. 17th: A crushing last week of 190 tons of ore from the Wyoming ledge averaged $27 a ton. The old Nevada quartz mine is developing a superior hody of ore at a depth of 75 ft. below the bed of Deer creek. The ledge is from 3 to 10 ft. wide, and the rock they are hoisting will yield from $17 to $25 to a ton. The Providonce mine, opposite tbe Nevada, has been leased by a Co. of practical miners who are sinking a new incline on the ledge. This is down 135 ft. from the surface, and 25 ft. below the bed of Deer creek. In the bottom of their incline they have a fine body of ore 4 ft. wide, heavily charged with sulpburets. They have already raised 50 tons of rock, taken from their incline while sinking. The incline the Co. are sinking has 2 compartments, one for hoisting and tbe other for pnmping. The Co. intend to sink their incline 100 ft. deeper hefore they commence drifting on the ledge. The Tremont mine, running parallel with the Novada and Providence, is being reopened after having heen idle for several years.

DUTCH FLAT.—At 8 o'clock Saturday, an immense hlast of 700 kegs of powder was exploded in the Dutch Flat Blue Gravel miue with splendid success, and immense execution.

DAISY HILL.—The mine displays a fine body of ore at the bottom of the shaft from 3 to 4 ft. in width.

PLUMAS COUNTY.

RICH STRIKE. — *Quincy National*, Feb. 17th: A very ricb chimney was discovered in the Baker mine, one day last week. The strike occurred on the 180-ft. level, and it is thought that the rock will yield $500 per ton. From one days' run of 4 stamps, $200 was cleaned up.

HUNGARIAN HILL.—Operations on Hungarian Hill will commence next wesk.

LIGHT'S CANON.—Pierce & Co., whose claims are about a mile east of the old Presby place, bave plenty of water and have been running some time. These claims are very rich.

GOOD LEDGE.— The workmen in the Genesee claims, near Genesee Valley, have recently struck the largest ledge ever found in the claims, and the prospects are favorable that it is extensive.

STRUCK IT.—It is reported that Webster & Co. bave struck good pay in a flat opposite the moutb of Sqnirrel creek, near Argentine. It is said that they are making as high as $18 per day to the hand.

MEADOW VALLEY. — Cor. same: On Eagle Gulch, Wilson & Co. are husy, also Edmond & Co. One Co. is at work on Big creek. Hunt & Roinson, on Scad Point, have not yet commenced work for the season. Tucker & Co, have commencsd piping in their claims at Scale's Gulch, and Bossel & Co. are at it on the hillside near the upper end of Meadow Valley.

On Spanish creek, Grace & Co. have commsnced work at grass Flat. Nslson & Co. have already commenced piping on their ground near hy.

The Phelps Bros. are prospecting a gravel deposit further up on the creek. At Red Hill, Messerer & Co. are putting their claims in good order, to take advautage of the abundant water supply.

On Gopher Hill, Metcalf is at work, as also Thomas Haycock, with plently of water. L. Jacks is piping a good portiou of the time. Morris Smith & Co. are steadily at work. E. B. Jackson Badger Hill, is running off the gravel pretty lively. All the above companies have reasonable expectations of realizing a fair profit this season.

SAN BERNARDINO COUNTY.

PROSPECTING.—San Bernardino *Guardian*, Feb. 24: The expedition which left San Bernardino abont 2 weeks ago, for Death Valley, for the purpose of finding, if possible, the rich silver ledges discovered there and abandoned a few years ago, will be followed by another party who will leave in a few days from this place.

SHASTA COUNTY.

The placer claim of Moody and Eiler, in the new mining camp near the Tower House is paying $25 a day to one rocker.

SIERRA COUNTY.

SOLD. — Downieville, *Mt. Messenger*, Feb. 24: The North America claims at Newark, have been sold to capitalists.

GRANT'S MILL.—Considerable ore has been crushed recently at Grant's mill from the Good Hope ledge.

Cor. Marysville *Appeal*, Feh. 28: The Docile has heen steadily advancing until it has reached a distance of 630. ft from the mouth of the tnnnel. They have crossed several spurs supposed to he offshoots from the main lead, which they are liable to tap at any time.

The New York cleaned up yesterday, with very satisfactory results.

The Buckeye is the richest mine iu this vicinity.

Nevada.

ELY DISTRICT.

BULLION.—W. F. & Co. shippcd since Feb. 22, bullion valued at $67,705.47.

SPRING MT. TUNNEL.—Work is being carried on by 3 shifts, driving the main tunnel ahead about 9 ft. a day. The formation is favorable, and works easily. The ledge struck 25 ft. from the mouth of the tunnel is improving. The ledge matter is abont 4 ft. wide.

PEAVINE.—Work is to he commenced at once upon the mine to thoroughly develop it.

RED CLOUD.—Work is being carried on without ceasing. The shaft is down over 50 ft.

INGOMAR.—Gen. Page is putting up steam hoisting works. The claim is looking very well.

WARD BEECHER AND VULTURE.—It is reported that a valuable strike has been made in this mine at 165 ft. On Monday last a large body of horn-silver was struck in the Vulture, 5 ft. in thickness.

BOWERY.—The main shaft is heing straighteued, enlarged and timhered.

ALPS.—Since our last issue the body of ore in the east drift has improved considerably. The west drift continues in good ore.

SOMERSET MINE.—This claim is on tbe eastern slope of Spring Mt., about 200 ft. south of the Havana mine. The incline is 31 ft. deep. At the hottom of the shaft the ledge is 30 inches wide. The ore shows chlorides and some horn-silver.

EUREKA DISTRICT.

RUNNING.—Eureka *Sentinel*, Feb. 24: The furnaces are all running with plenty of ore on the dumps, and are constantly turning out their usual quantities of hullion.

FRIEBURG.—Goodwin & Co. are working 80 men in tbeir mines and on their furnaces. The new furnaces will go into operation in about 10 days.

BATTLE MT., March 1st.—By telegraph—130 tons of copper ore from the Battle Mt. M. Co.'s mine was forwarded from here this morning to S. F. for shipment to England.

HUMBOLDT.

BULLION.—Unionville *Silver State*, March 2: Amount shipped from the Arizona mins, since Feh. 17th, was $13,197.

UTICA MILL.—This mill, at the outlet of Humholdt Lake, is to be started up again on ore from the Oro Fino mine, Desert dist. There is now ahout 1,000 tons of ore, which it is estimated will pay $60 in gold to the ton.

NATIONAL MINE.—This mine though favorably situated has not been worked of late. Chris. Lark, has concluded to put on a force of hands, as soon as spring opens.

STILL YIELDING.—The Sheba mine is still prodncing large quantities of fine ore. Some assays made of a fair quality of shipping ore went as higb as $2,200 per ton.

MAMMOTH.— Thc owners contemplate putting it in the way of development as soon as the spring opens.

ECLIPSE. — The owners are pushing ahead in their tunnel and expect to strike the main ledge within the next 20 ft.

The prospects are that the bullion yield of Unionville for 1872, will be nearly double what it it was in 1871.

The Henning mine is said to be looking better than ever.

SEMINOLE TUNNELING CO.—Recent developments in the mines owned by the Seminole T. Co, in this dist. prove heyond douht the value of the property. Last week a vein was tapped disclosing 3 ft. of quartz containing ore of excellent quality.

DUN GLEN.—Cor. same: Sprague & Co.'s mill is running regularly on ore from the Lang Syno mine, which is yielding far more than the most sanguine of its ownsrs ever expected it would. They have had many difficulties to contend with, but thsy have finally succeeded to a certainty. Their process is heyond a doubt one of the best now in use for the reduction of gold ores.

Tho Lang Syne miue is improving in the south drift. The lode is 2½ ft. wide, all of whicb is good milling ore.

The Red Warror, a new location, shows a good body of pay ore on the surface.

WINNEMUCCA Feh. 26: By Telegraph.—W. F. & Co. received to-day 4 bars of bullion from Silver City Idaho.

REESE RIVER.

MONITOR ORE.—Reese River *Reveille*, Feb. 27: The Manhattan Mill will commence to-morrow to crush ore from the Monitor mine, at Belmont. Forty tons is at the mill awaiting reduction.

RESUMED.—The Pacific Co. have resnmed work in their mines and overything is going on as usual.

WASHOE.

SIERRA NEVADA.—Virginia *Enterprise*, March 2: The ore body struck in the Sierra Nevada mino last Saturday is improving.

CHOLLAR-POTOSI.—The bad state of the roads has compelled the Chollar folks to shnt down their mine, all their dnmps bsing full to overflowing. A few men are still at work in the mine prospecting.

THREE or fonr Cos. are at work in the vicinity of American Flat. As yet hut one of these—the Globe—is milling ore.

IN FULL BLAST.—The mills on Six an

Seven-mile Cañons are in full blast on ores from the Comstock.

A Co. called the New York have begun sinking a shaft back of the the Marysville mill, east of Gold cañon.

There is talk of resuming operations on the Occidental mine this spring.

The Justis Co. are running a tunnel from Gold Cañon to their mine for the purpose of making an outlet for the water pumped from the lower levels.

WHITE PINE.

Bullion.—White Pine *News*, Feb. 24: W. F. & Co. shipped to-day to London for Eberhardt & Aurora M. Co. (limited). 2 bars of bullion 184 pounds valued at $2,334.01.

Silver Wave.—The Perkins shaft is down 105 ft. in limestone formation. No. 4 shaft is down 115 ft. and running on spar wall. The drift from the bottom of the shafts is finding chloride and quartz mixed.

North Aurora.—In the South drift from the Lady's chamber the ore has improved in grade and body.

Ward Beecher.—Sinking winze in the bottom of Phillpots chamber, to connect with the East drift from the Lady's chamber. Shipping by tramway to the mill.

East Shenoygan.—The East Shoboygan Co.'s mines are looking well. The most of the force of men are engaged prospecting and making openings.

Copper Silver Glance.—A shift of 2 men is engaged sinking the North shaft. The indications for finding a good body of ore are encouraging.

Noonday.—Mr. Woodman, the foreman, is opening the mine in good shape. The ore body holds out as far as openings are made.

Arizona.

Yavapai Co.—Prescott *Union*, Feb. 17: The last run made by Jackson, Shoup & Co'a. 4-stamp mill, upon ore from the Del Pasco lode, yielded 43¼ ozs. of gold. This run did not exceed 3 days. The Tiger mine is yielding plenty of rich ore. The Benjamin and other mines, near Prescott are developing. Placer mines are doing well in the several creeks and gulches in the vicinity of Prescott, and Weaver. The Vulture is being mined and milled with satisfactory results. A furnace is being erected at Peeplea valley.

Mohave Co.—In Wallapai Dist., all the prominent mines are turning out well.

The Pioneer mill has been running regularly upon Lone Star rock, and is paying very well. Mr. Spear, shipped last week $5,000 in bullion. The furnace at Chloride is going up.

Smeltino Works.—Los Angelea *News*, Feb. 24: About 50,000 lbs. of machinery for smelting works at Wallapai, is lying at the beach, ready for shipment.

Colorado.

Colorado *Herald*, Feb. 14: At a depth of 450 ft., Harper's claim in the California Lode, carries a crevice of ore that varies in width from 2 to 4 ft. in the shaft, while in the drift running west its entire length, 140 ft., a crevice of ore has been exposed that averages over 1 ft. in width.

Good News.—In the Caribou mine, in the bottom of the main shaft the crevice is 5 ft. 7 inches in width of paying ore, 20 inches of which is first-class, worth from $500 to $700 per ton. On the east shaft a whim has been erected and put in operation. From this they are raising a large amount of fine ore. The teams are delivering about 20 tons per day to the mill.

The Carihou mill at Middle Boulder, has turned out a very handsome lot of bullion. They have shipped about 12,000 ozs. and have a large amount of amalgam not yet retorted.

The starting of this mill has given the dist. a new impetus. Already the owners of the Seven-Thirty, the Potosi, the Boulder Co. and others have sent in a lot of ore for sale, and others are preparing to do so. Ben Hines is pushing work on the Trojan and crushing his second-class at the Hines & Heizer mill, at Middle Boulder. The yield is about 7 ozs. per cord.

Lake Co.—Cor. same: Lode mining is lively. Work on the Printer Boy, Pilot, Oro Fino, New Brunswick, etc., is being pushed ahead with great vigor. Prospecting on a number of new lodes is being carried on with good indications of striking pay.

A. G. Hill is opening the Graut and has a very fair crevice of quartz. A. Gorman is driving a tunnel, and soon expects to strike a lode. On the south side of California Gulch, Mr. Bugh has started a new tunnel, with a view of prospecting the hill, where it is thought there are a number of good lodes as yet unopened. Above Oro City, McCanuon & Demsoy are working a lode discovered last summer, that prospects big. Henry Mayfield, in Iowa Gulch is prospecting for lodes. At Granite 20 miles below, C. S. Hill has a contract to sink 50 ft. on the Hatty Jane lode, one of the most promising in this locality. A report is current that the Yankee Blade Co. intend to resume work soon.

Boulder Co.—Cor. Caribou *Post*, Feb. 20th: The Jones lode, on the northwest side of Caribou Hill, is down 30 ft. They have a pay streak of fine mineral 4 inches wide. I observed 20 sacks of ore, which assays $200 per ton.

The Grand Review is down 58 ft., and looking about the same. A number of lodes are being worked on Idaho Hill, viz: The Elephant 109 ft. deep, is to be drifted upon soon. The Silver Point, 28 ft. deep. The Monitor is also being worked.

The Seven-Thirty has attained a depth of 70 ft. They have a pay streak 6 inches wide of very fine mineral. At a depth of 35 ft., they have a drift running east 35 ft. and a shaft 35 ft. deep in the drift. The second-class ore runs $500 per ton; third-class $100. It is estimated that they have $10,000 worth of ore on hand.

The Trojan lode, at Cardiual, is looking extremely well. They are down 95 ft., and drifting. Two different parties are taking out ore from the Boulder Co.

Our Mines.—Same paper, Feb. 17th: The old Caribou Co. who are working the East End, have a fine shaft erected, and are taking out rich ore in large quantities.

The Seven-Thirty is being worked with very promising and paying results.

The Wabash lode is down nearly 60 ft. and is looking exceedingly well.

Some of the other lodes that are being worked on Caribou Hill, are the Stranger, Grand View, Sweeden, and Jonas lodes.

At Cardinal the Trojan is being worked. They are hoisting a large quantity of valuable ore.

Shipped.—Colorado *Miner*, Feb. 22: Baily & Nott have shipped on account of owners, during the past week, 20 tons of smelting ore.

Palmer & Nicholas have shipped 2 bars valued at $2,260.88.

The Matilda Fletcher lode is yielding very rich 1st class ore, and large quantities of 2d class milling ore. A 10 lbs. lot of 1st class ore, treated, gave a yield at the rate of $12,000 coin per ton.

Maine Lode.—The yield of the Maine lode for 8 months, since its discovery, has been $38,989.32 above expenses.

Gold Hill.—Caribou *Post*, Feb. 24: Mr. Fullen is working his White Rock lode this Winter, and Mr. Cort is erecting an engine house and other buildings on the Horse-fall.

Yesterday, at the bank of Young & Co. was seen 855 oz. of gold retort, the Jan. product of the Leavitt lode Mountain City. This is valued at $15,500, and is the product of 105 cords of stamp-mill ore.

Local Record.—In making our trip this week, we noticed both the ore chutes of the Oro Fino full of ore. We also found the shaft on the Navigation mine down about 140 ft. where it connects with a drift from the Oro Fino.

The Ida Elmore is being opened up fast. The 6th level drift is run 130 odd ft. north, far enough to get over the rich body of ore in No. 7.

Idaho.

Bullion.—Silver City *Avalanche*, Feb 24: W. F. & Co. shipped from here this week 3 bars of bullion, valued at $6,468.07.

The Mahogony mine is turning out some very fine ore between the 3d and 4th levels. The shaft is down for the 5th level. The ore house is full of ore which will soon be hanled to the mill.

The South Chariot 4th level drift is being run north on the vein. The main shaft is to be straightened and sunk for the 5th level.

There are 75 tons of Empire ore at the Elmore mill which will pay about $150 a ton.

South Mt.—Cor. same: The only mines being worked here are the Bay State and Hastings, operations on all others having been suspended on account of bad weather.

Banner Dist.—Idaho *Statesman*, Feb. 20: Gardner and Lee are down 30 ft. on the ledge. The quartz looks better, but has become very hard; it all has to be blasted.

Montana.

St Louis Gulch.—Cor. Helena *Herald*, Feb. 22: The Union Co. have recently struck very rich pay in their ground in the left fork of Indian creek. From 2 pans of dirt were washed out $10.90.

The Kelloy Bros. have a large tract of mining ground, from which they are raising a small mountain of grit, over average in richness. From hence for about a half mile no work is being done, some of the ground being worked out and the remainder not yet drained.

At the head of the drain is the claim of Easterly & Co., who are pushing ahead with the work fast, and at the same time hoisting and sluicing with profitable results. Passing on down the creek, we come to the mines of W. H. Risk, J. Lyons, Collior & Co., H. Winters, and Buckingham & Co., all of whom are doing well. Then we reach the works of Tierney & Co., who are coming up with the old Diamond drain, with good prospects. All that is being done here this winter in the way of placer mining.

Junction.—Cor. *Avant Courier*, Feb. 15th: At Aldor Gulch nearly all the flume Cos. are going to increase their force of hands, and the works generally will be more energetically pushed forward than they have for many years past.

At Summit, Covely & Bro. are tapping the Keystone 200 ft. deep, and have about 80 tons of fine ore on the dump.

There are 14 bed-rock flumes in the gulch, most of which have been doing well.

Hart & Cass have their main drain completed, and are making branch drains preparatory to extensive spring operations.

At Adohe Town there is more progress manifest than all the rest of the gulch combined.

Utah.

Pioche Bullion.—S. L. *Tribune*, Feb. 26: W. F. & Co. have received since the 16th inst. 2 two lots of bullion valued at $126,608.90.

North Star Dist.—Cor. same: I visited the Shenandoah mine owned by Schonberg & Co., who have sunk upon their shaft 50 ft. The Co. have some 150 tons of splendid ore on the dump worth $150 per ton.

The next mine in the immediate vicinity is the "Old Hickory," owned by Hooker Cook & Adams. They have got down 40 ft. through a rich and very large body of mineral.

South Star.—In this camp are the Taylor and Jupiter lodes, with shafts in ore, from 80 to 100 ft. in depth. The Mt. Vernon and Bibhins are looking well.

Middle Star contains some of the most promising ledges in the Dist.

West Camp is the last discovery. The ore in this camp is quite free, and can be easily milled without the intervention of roasting furnaces. Most of it is of a high grade. Prospecting is being actively carried on here, as well as throughout the entire Dist.; and frequent discoveries of great richness reward the miners.

Mining Shareholders' Directory—Meetings, Assessments and Dividends.

[Compiled weekly from advertisements in the Scientific Press and other San Francisco journals.]

S. F. Stock Exchange Board.

San Francisco, March 7, 1872.

Stocks have fluctuated considerably during the week and prices at close are rather low. The sales at the Board for the week ending Wednesday the 28th ult. amounted to $3,377,000. The capital stock of the Keystone M. Co. has been increased to $1,000,000 in 10,000 shares. The Marcelind M. Co. has elected the following Trustees: S. Heydenfeldt, (Pres.), C. E. Elliott (Sec.), C. C. Palmer, P. P. Cunningham and Geo. D. Roberts. The Raymond & Ely mine sent down on the 29th ult. $33,000, on the 2d, $31,000, and on the 6th inst. $31,200. The Alameda Coal Mining Co. have elected the following Trustees: W. B. Agard (Pres.), B. E. Anger, A. Braudt, P. Cassou, L. Pavillier. M. Phillips is still Secretary.

The Chapman M. & M. Co. have elected as Trustees, E. P. Figg, L. A. Chapman, J. H. Vimont, O. L. Muller, and C. B. Putnam. Jos. Maguire was elected Secretary.

The dividend of the Chollar-Potosi was omitted this month for the first time in ten years. The February receipts from the Succor mine amounted to $18,000.

The Daney election on Monday resulted as follows: O. F. Griffin, Geo. F. Bragg, L. S. Adams, F. A. Gibbs, and Robt. Sherwood.

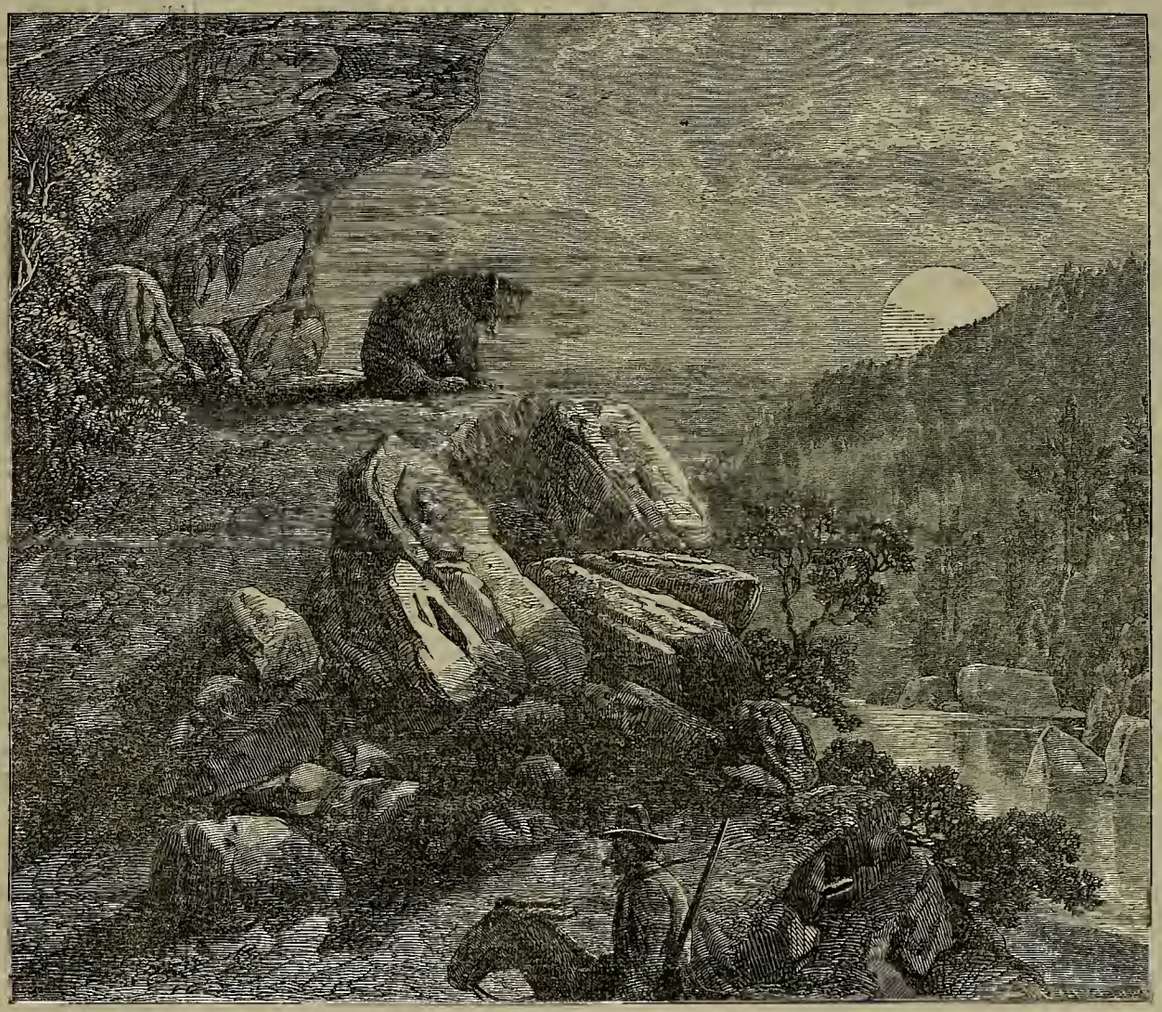
Meeting a Grizzly.

In the early days of California the mountains of the State were infested with those fierce and powerful monarchs of the forest, the grizzly bear, and numberless are the stories current of wild and startling adventures in their search. Those pioneers of civilization, the miners, frequently met them in their prospecting trips, and when prudent, gave them a wide berth; still, some of the more reckless and daring of this adventurous class, sometimes attacked them, and unless well armed and in numbers, were in luck not to come off "second best." As a general thing unless surprised or attacked, they will not act on the offensive; cases are, however, known to the contrary. The growl alone of these beasts, when surprised or wounded, is enough to make a prudent man keep at a respectful distance, and the writer knows from personal experience that at night, in the dark gloom of the forest, with one in close proximity, it will make a man feel queerer, and his hair straighter, and offer superior inducements to accelerate tree climbing than most anything else could.

The miners of California generally went pretty well armed in early times, and in their visits to their neighbors at night were careful to carry their trusty revolvers, and, if possible, a rifle. This was found necessary for protection against ferocious beasts and still more ferocious men. Our cut represents a "pioneer" returning home at night, and who has taken a short cut home instead of going by the regular trail. His mule, from natural instinct, shows his knowledge of the proximity of the grizzly by laying back his ears and looking as if he did not like it. The bear is seated in front of his den upon a point of rocks overlooking the placid river, which glistens in the moonlight, and seems to be enjoying himself.



THE SHORT CUT HOME.

A well-appointed iron ship building yard and plant has just commenced operations at Wyandotte, a few miles below Detroit, on the river, adjoining the extensive rolling mills of E. B. Ward, who backs the enterprise, and which is under the management of Captain S. R. Kirby. A double-decked freight propeller is in course of construction, being intended principally for the silver ore trade of Lake Superior.

Letters patent have recently been granted for the invention of an improved railroad car for the transportation of grain. By this invention the grain is discharged in from three to thirty minutes, a great saving in time over the present process. One man can attend to the unloading of ten care, and discharge their contents as quickly as four men can unload one of the cars now used for grain.

The pig-iron product last year was 1,850,000 tons, of which all but 387,000 tons was anthracite or Pennsylvania. The business employed 940,000 men at aggregate wages of $564,000,000, and the value of the product was $900,000,000.

The Hunt & Douglas Process for the Extraction of Copper from its Ores.

No. 3.

The result of the above causes combined is that instead of 89 parts of iron there are consumed, according to circumstances, from 200 to 300 parts of metallic iron to produce 100 parts metallic copper in the form of cement copper. This too is rendered impure by an admixture of insoluble presalts of iron generally amounting to from 20 to 40 per cent., and even more. The present process avoids both of these faults, and enables us to obtain a pure cement copper with a very small consumption of iron. The solution obtained with the bath of protochlorid of iron can contain no persalt of iron in solution, and if protoxyd of copper alone has been employed will hold three equivalents of copper combined with two equivalents of chlorine, so that they will be precipitated by two equivalents of iron, being at the rate of 59 parts of metallic iron for 100 parts of metallic copper. If, from the presence of much dinoxyd, or from other reasons, the greater part of the copper be present as dichlorid, it will be remembered that this requires only one equivalent of iron to precipitate two equivalents of copper, being at the rate of 45 parts of irons for 100 parts of metallic copper.

The precipitation of copper from the solutions is at first rapid, especially if these are hot, and kept in agitation. Inasmuch as the waste liquors are not rejected in this, as in the ordinary process, the long digestion with iron required to remove the last portion of copper is dispensed with, and the liquid, after having given up the greater part of its metal, is withdrawn and used for the treatment of a fresh portion of ore. The prolonged action of the air on the bath is thus avoided, and we obtain a cement copper almost entirely free from insoluble iron salts, and with the consumption of a minimum quantity of iron.

The Regenerated Bath.—If the action of the air be excluded it will be found that the bath, after complete precipitation of the copper by iron, will be nearly as rich in protochlorid of iron as before the solution of the copper. The loss, which is due to the separation of a portion of oxychlorid of iron during the solution, is variable, and in some cases does not exceed six per cent. The various ways of supplying this loss are three: (1) The direct addition to the bath of a portion of protosulphate or protochlorid of iron. (2) The addition of a portion of sulphate of copper from the roasted ore, and (3) the use of enlphurous acid. Of these the first requires no explanation, and the second and third will be explained under the two following headings. The proportion of iron in the bath should be determined from time to time by the following method: A small portion of the bath, freed from copper by digestion for some hours with metallic iron in a stoppered bottle, is diluted with 50 parts of water, and strongly acidulated with snlphnric acid. A standard solution of permanganate of potash of known strength is then added from a graduated tube so long as it is decolorized. By comparative experiments of this kind on the regenerated bath its stringth in protochlorid of iron is readily determined.

The Protosalts of Iron.—In preparing the bath we have recommended either protosulphate or protochlorid of iron. The former salt, being an article of commerce, is to be obtained in many places where the latter cannot readily be procured, and may be easily manufactured for the purpose in regions where neither of these can be readily obtained, provided snlphuretted copper ores are to be had. It is well known that in roasting these a considerable portion of the copper is converted into sulphate, which may be readily dissolved by water from the roasted ore. If to each 63.4 ponnds of copper thus dissolved, we add 120 pounds of common salt, and digest the liquid with metallic iron in a close vessel, best with the aid of heat, till the copper is precipitated, the solution will contain such an amount of protochlorid of iron that it will only be necessary to add 200 pounds of common salt and a sufficient amount of water, to make 100 gallons of the bath of the strenght before prescribed.

If a roasted ore, charged with sulpbate, be added directly to the bath of protochlorid of iron, it will be found, after precipitating the copper by metallic iron, that the regenerated bath will contain not only the protosalt of iron corresponding to that originally present in the bath, but also that resulting from the action of the metallic iron on the sulpbate of copper introduced, which has given rise to protochlorid of iron and sulpbate of soda by double decomposition; thus rendering the bath impure both from the presence of sulpbates and from an excess of protochlorid of iron. To obviate these results we add to such roasted ores, (as already described), so much lime as may be necessary to convert the whole or the greater part of the sulphate of copper present into insoluble sulphate of lime and protoxyd of copper, which latter is at once soluble in the protochlorid bath. A small portion of sulpbate of copper, as above prescribed, may be left undecomposed by lime, and by its reaction with metallic iron will give the protosulphate of iron required to enpply the small loss already explained, and keep up the regenerated bath to its original standard, as shown by the test with permanganate.

The use of protosulphate of iron for making the bath, introduces a large proportion of sulpbate of soda. A great part of this, it is true, crystallizes out when the bath is exposed to cold, and may thus be got rid of. The use of a portion of chlorid of calcium may also, as already explained, be resorted to with advantage where this substance can be cheaply procured. In districts where hydrochloric acid is a bye-product of little value it will be best to obtain the protochlorid of iron directly by saturating the crude acid with scrap iron and employing the product as already explained.

Use of Sulphurous Acid.—When the mixture resulting from the action of oxyd of copper upon the bath of protochlorid of iron is heated, and exposed to the action of an excess of sulphurous acid, the whole of the separated peroxyd of iron is converted into a protosalt, and the bath, after precipitation by metallic iron, is found to contain much more protosalt than at first. Such a result is generally to be avoided, but by passing into or over the bath a small portion of sulphurous acid, it is easy to dissolve such a portion of the precipitated oxychlorid or oxyd of iron as to prevent the loss of iron which otherwise occurs, and keep up the standard of the regenerated bath without the addition of a salt of iron or of sulphate of copper.

The introduction of air with the sulphurous acid is to be prevented as much as possible, since it tends to convert the dichlorid of copper into protochlorid, and thus increase the consumption of metallic iron.

*When, as in ordinary cases, the bath holds sulphates, the precipitated peroxyd contains a basic persulphate, with but little of the oxychlorid which is found in a bath where chlorids only are present.

[Concluded next week.]

Michigan silver mines this year have yielded about $1,000,000 worth of ore. The estimate is that about $100,000 a month can be taken out at a cost of $8,000. Wyandotte smelting works have sent $400,000 to the mint from one mine alone.

An umbrella frame in process of manufacture has to pass through more than one hundred hands, and is the result of remarkably delicate and ingenious manipulations.

Useful Information.

Removing the Odor of Carbolic Acid.

The value of carbolic acid for many applications is now well established, but for medical purpoeee is greatly diminished by the odor, which ie extremely offensivo to many porsone. It may, thorefore, bo interesting to know of a method which will remove this odor, eubstituting for it a delicate trace of geranium loaves, which may, perhaps, be improvod upon by adding a few drops of that oil. Tho process, as rocently published, consists in pouring one pound of the best carbolic acid (tho white crystallized) into two gallons of cold distilled water, taking care not to pormit the *whole* of the acid to enter into solution. With a good samplo, if, after shaking repeatedly at intervals, botween two and three ounces of tho acid remains at the bottom of the vessel usod, this will be a sufficient residne to hold and contain all the impuritios; witb bad eamplos, less water must be used, and more acid. The watery solution is to bo siphoned off, and filtered, if necessary, through fine filter-paper till perfectly clear. It is then placed in a tall cylinder, and pure powderod salt added, with constant agitation, till it no longer dissolves. On etanding for a time, the greater part of the carbolic acid will be fonnd floating as a yollow oily layer on the top of tho ealine liqnor, and merely requires to be removed to be ready for use. As it containe five por cent. or more of water, it does not generally orystallize, but it may be made to do so by distilling it from a little lime. The portion collected, up to about 365° F., bas, at ordinary temperatures, scarcely any odor save a faint one resembling that of geranium leaves. The addition of about four drops per fluid ounce of tho Frenob oil of geranium will still further mask tho slight odor of the acid, and has an additional advantage of liquefying the pure crystallized product. The pure acid may be dissolved in 230 parts of water, and used as a gargle, or in 25 parts of wator for painting the throat, or in 50 parts for the carbolic spray.

Clearino Bean of India.—Among other vegeteble productione of India is a epeciee of *Strychnos*, known there as the clearing nut, the dried seeds of which are used to e considerable extent for the purpose of cleering muddy water. For this purpese one of the nuts is usually rubbed bard for a short time round the inside of the oertben pot; the water afterwards is ponred into it and left to settle, the impurities soon eubsiding, and the water being left pure, clear, and wholesome. It ie said tho natives never drink well-water if tbey can get pond or river water, whicb they treat in the way indicated. These seeds have much the action of alum, but are believed to be less injurious, and are very easily obtained any where in India. The fruit when green, is made into proserves and eaten; but when ripe, and given in powdor, anewers the purpose of an emetic, a doee being about half a teaspoonful.

According to Dr. Pereira, the pecnliar property of these seeds depends on the presence of albumen and caseine, whicb act as purifying agents, like those employed for wine or beer. If the seeds be sliced and digested in water, a thick mucilaginoue liquor is obtained, which when boiled, yields a coagulum. A similar application is made elsewhere of otber kinds of seeds. Thus the inhabitants of Cairo render tbe muddy water of tho Nile quite clean by rubbing bitter almonds, prepared in a partionlar manner, on tbe inside of tho earthen jar in which the water is kept. Migbt not this India bean be made a profitable and useful addition to our California products?

Northern Limit of the Oyster.—Oysters, it is stated, cannot be grown in the seas of tbe province of Quebec, the northern limit of the habitation of thie sbell-fish on the east coast of North America being Carraqnette Bay, on the northeastorn point of New Brunswick. Attempts have been made to plant oysters in Gespé Bay, but the culture failed, in consequence of the extreme coldness of tbo water, whicb even in tbe summer is only a fow degrees above tho freezing point.

The oldest woolen cloth factory in the United States is probably that of Mr. Thaddeus Clapp, of Pittsfield, Massachueetts. This manufacturer has in his poseession epecimens of cloth of his own manufacture, selected from the production of each year from 1812 to the present timo. Such a collection is obviously interesting to any one who is curious to observe tbe progrese in the United States of the art of making woolen cloth.

Combining Scents.

The art of tho perfumer is ehown in delicately combining different eeents. When we walk in a garden, tho delicious odors that greet us aro by no meane tho emanations of ono flower. All the blooms of the garden, more or less, add to the general harmony that strikes so gratefully upon the olfactory nerves; they reach ue in sueb infinitely emall particles, that no ono scent overpowers the other. Whon art attempts to imitato the diluting effect of tho broeze, eho has to be more circumspect. Only odors of a similar octava, as a recent writer has pointod out, will agree with each other. Another anthority, indeed, has elaborated this idea, and has composed a perfect gamut of odors, beginning with civet, vorbena, and citronella in the troble clof, and ending with the wallflower, vanilla, and patchouly in the bass clef.

Dealers, on the strength of thoir olfactory nerves, often make purehases amounting to thousands. The tea merehant, tho tobacco dealor, or tho hop merchant takes one sniff at the commodity in which ho deals, and makes his purehase without fault. An experienced perfumer will have two hundred odors in his laboratory, and can distinguieh every one by name. Could a musician, witb an instrument of two hundred notes, distinguish and name every note struck without his eeeing the instrument? Every person, from his own experience, can testify to anotber quality which scent in common with sound possesses; we allude to the power it has of recalling to tbe mind's eye the ecenes of long past years. The mere breath of a perfume will often call up a picturo of an event with all its minutiæ, which had long lain dormant in our memory.

Curious Customs.—An English paper says that among tbe curious local customs still practiced in Derbyshire is one which wae kept up for 140 years at Hilton Hall. On tbe first day of the year the lord of the manor of Essington brought a goose to the hall, and drove it three times round the fire, after whicb he carried it to tbe table, and received a dish of it for bis own use. Tbis droll proceeding wes ouly discontinued when the manors came under one lord. At Wellsall there is an annual adult scramble; for here a custom exists of throwing out apples and nuts from the Town Hall, on St. Clement's day, to be scrambled for by the people. Happy are the boys that are born in Wellsall! At Wichner, tbe eeme custom tbat hes prevailed at Dunmow was once in use, and a wooden flitcb of bacon still hangs in the ball. In tbis case it was John of Gaunt who instituted the cnstom by arranging that the owner of tbe ball should hold tbe tenure in virtue of his keeping a flitch of bacon always ready for any married pair who had been married a year and a day and would take tbe following oath: "Hear ye Sir Philip de Somerville, Lord of Wychenor, mayntennor and gyver of this baconne: I. A. B., sitbe I have wedded my wife, and eitbe I bad ber in my keeping and at my wylle by a year and a day after our marriage, I would not bave changed for none other, fairer ni fouler, richer ni poorer, etc. And if tbe said B, were sole and I sole, I would take ber to be my wyfe before all the wymen of the world. So help me God and all tbe flesbes!"

Preparation of Hides.—The following method is recommonded for preparing leather: Begin by eoaking the hide eight or nine days in water, then put it in lime; take it out, remove the hair by rubbing, and soak again in clear water until tbe lime is entirely out. Put one pound of alum to three of salt, dissolve in a vessel eufficiently large to hold the hide; eoak the hide in it three or four daye; take it out, let it get half dry, and then beat or rub until it becomes pliable. Leather prepared by this prccess will not do well for shoes, but answere for hamstrings, back-bands, and other purposes on tbe farm.

Dark Rooms.—When a room is so situated that tbe windows admit but little light, ae ou a narrow lane or alley, their illuminating effect may be greatly iucreased by placing tbe panes flueb with the outer face of the wall, and using glass which has been roughly ground on tbe outside. The particles of the glaseare thus made to preeent innumerable faces in every direction, and the ligbt thus gathered ie transmitted to all parts of the room, whereas with tbe ordinary windowe only so much light is obtained as is reflected from tbe opposite walls.

Good Health.

The Effect of Light on Smallpox Pustules.

Among the many invostigations now being made of the chemicel action of light, there are none more interesting than those which are directed to tho observation of its effects on the health. It hae been observed by Dr. Webber that the sensibility of the skin is very much increased in those parts of the body which are always exposod to the light, and this difference has evon been measured by that eminent physician. This remarkable fact is especially observable on persons euffering from smallpox, the soverity of the skin disease being visibly augmented if the patient be not confined in a dark room. Dr. Waters has recently published a paper on this subject, in which ho states that if the room bo so darkened that not a single ray can enter it, the effect is to arrest the disease at the papular or vesicular stage; it never becomes purulent, and the ekin between the vesiclce is nevor inflemed or swollen; the *liquor sanguinis* is not changed into pus, nearly all the pain and itching are absent, and the smoll is, if not entirely removed, greatly diminished. Another advantage, important in a therapeutical point of view, ie the assistance given to medicines, the absenco of light increasing the excretory powers of the skin.

Cure of Flatulency.—A writer in the *English Mechanic*, in treating the not unimportant subject of flatulency, eays that of this there are two kinds. In bealtb tbe stomach and intestines alwaye oontain a moderete quantity of gas that is nearly pure nitrogen. This appeare to be secreted by tho mucous membrane of tbe stomach and intestinos, and, in excessive amonnt, is one of the most troublesome kinds of fietnlence. The other kind arises from fermentation or putrefactive cbanges of the food, and conteins carbonic acid, end sometimes sulphureted hydrogen, as well as nitrogen. Botb these forms of flatulence are best treated by using pure vegetable charcoal finely powdered—teken in tbe first case with eech meal, and in the second as soon as the symptoms appear. Tbe dose mey be a teaspoonful, and its use sbould be continued for eome time. Tbie will usually correct constipation as well as looeness of the bowels, besides relieving the diseese itself.

Decay of the Teeth.—Tbe acids wbich cause tbe decay of the teeth are conveyed in the secretions of the gums and the mucous membrane of tbe lipe and cheeks; and the usual points of attack are in the interstices and the groovee in the facial walls of tbe teeth. Tbe calculary nature of the saliva is antagonistic to tbe acids, and preserves tbe teeth from their dilapidating influence. Teeth are protected from this disease by tbe following conditions: Their regular shape and order, tbat the situetione for tbe deposit of acid be as few ae possible; the conservation of the teetb from noxious influences, by constant brusbing; tbe healthy structure of the tooth itself, and of the moutb generally. Heider observed tbat the yellowish white teeth are lese eubject to the attacks of cariee than those of a bluish shade, the enamel of tbe former being much harder; and the molars have been fonnd to contain more mineral substance than the incisors.

Air-cushion for the Feet in Railway Travel.—A writer in the *Medical Times and Gazette* refers to the fatigue of the limbs produced after a long railway journey as due mainly to the trembling motion of the floor under the feet, and states tbat, having suffered considerably from this cause, he was induced to try the experiment of using the well known air-cusbion as a foot-stool. This answered so well that be has never traveled without using one in this way, and has found tbe effeot to be a remarkable improvement.

Cold Cream.—"B. L." of Sacramento, Cal., eends to tbe *Druggists' Circular* the following formula for making cold cream, which he thinks euperior to anytbing heretofore published: Oil of almonde, (English) 8 oz.; white wax, 1 oz.; spermaceti, 1 oz.; rose water, 6 oz. Put the oil, the wax and spermaceti with 4 oz. of the rose water in a porcelain dish; beat over a wator batb till all is melted. Transfer to a suitablo mortar, and beat constautly till quite cold; then add the balance of the rose water by emall portions, and beat at least ½ bour longer. If rose water is not convenient, use pure water instead, and add 2 drops of oil of roses immediately after the last portions of the cold water. Keep in well closed jars. The selection of the oil of almonds is most important; proeure the best English oil, and beware of the eo-called French oil of almonds; this ie imported here under ite real name—poppy seod oil, and baptised on its arrival "French oil of almonds."

The Agriculture of the Mormons.—Our people wonder much that the Mormons have been able to build a city and find eubsistence for their thousands of people in such a region, but when we learu the qualities of the soil around them, and the nearness and abundanco of mountain springs, the wonder ceases. The labor needed to make their lands fruitful beare no comparison to that the Now England settlers had to expend in order to prepare a place suitable for their crops; and while their soil still retains its rich properties, with no apparent exhaustion, ours has to bo replenished with foreign material every year. They find the earth about them already loose, level and rich; they pour water over them and their vegotables grow abundently, and fruit trees are weighed down with their burdens. It is trne that tbey have to dig long ditches and to construct long sluice ways from the elopes of the hills above them, but thie ie all. There are no forest trecs to be felled, no etumps to dig up, no rocks to remove, no deep plowing to be done, and nb chomical fertilizers to be added, before they can reap rich returns from field and garden. They simply knew twenty yoers ago what the rest of the American people are just discovering, that the greater part of our Centrel desert is in reality no desert at all, but the richest meadow land minus one property—water. And water seems to be the only want of tbe world after we pass the Nebraska pleins. Where brooks and rivers flow, man can live at his ease, wbere tbese are wanting he forsakes the land, sets to work, like the patient Mormons, to lead down the melting snowe of neighboring mountains to water hie crope during tbe rainless midsummer days.—*Cor. Boston Journal.*

A Chiocory Manufactory. — Messrs. Mein & Raab are preparing to establish a chiccory manufactory in this city. Mr. Mein ie a practical manufacturer of the article, and has bad much experience in the business in seme of the most extensive manufecturing establisbments in Pruesia. The experimeut hes been tried by these gentlemen, et a point on the San Joequin river a few miles from this city, but unfortuuately just about the time the machinery was put in successful oporetion and all the necessay apparatus in working order, tbe factory was destroyed by fire. They propose to manufacture chiccory on quite an extensive scale the coming summer, and witb that end in viow have entered into contract with several farmers to supply tbe green cbiccory. It is expected tbat not less than two hundred and fifty acres of land bordering on the San Joaquin and Calaveras rivers will be cropped witb chiccory the present year, aud it is estimated that the yield will range from fifteen to tbirty tons per acre. The yield last year on some land near tbe San Joaquin river averaged the latter amount. Fifteen dollars per ton ie, we understand, the price paid by tbe manufacturee for the green article. Samples of tbe quality manufactured by the gentlemen named have been sent to merchants in New York, Chicago, St. Louis and other large cities in the East for inspection, and the uniform verdict of dealere is that it is far superior in quality to that imported from Prussia, Holland and other eastern countries. The quantity of cbiccory consumed annually in the United States is enormous, and the demand is almost wholly eupplied from abroad. It is probable tbat not less tban a thousand tons will be manufactured by Meine & Raab during the coming summer. *Stockton Independent.*

Deposit of Mineral Paint.—Our attention, says the Indiana *Democrat*, has been called to the wonderful productions of sienna or mineral paint, found in largo quantities upon the farm of John Cessna, in Banks Township, in tbis county. Thie paint comes from a bank of rocks on Straight's Run, and is deposited in large quantities in a dam. It has been pronounced by competent judges a superior article, really better than the sienna imported from France and Italy, for the reason that it is entirely without grit. According to tbe definitions, it is a silicate of iron, and is also called *terra sienna*. It is estimated that tbe deposit is inexhaustible, bundreds of tbousands of tons being expoeed; and this is increased every day by the quantities wbich flow from tbe rocks.

EDITORIALS.—An Act to Enforce the Responsibility of Stockholders; The Geological Survey; Academy of Sciences, 145. Our Mining Prospects, 152. Our Home Industries; British Africa—Diamonds and Gold, 158. Notices of Recent Patents; Mechanics Institute, 156.

ILLUSTRATIONS.—Portable Sawmill, 145. Meeting a Grizzly. 150. Improved Tug Buckle, 152. Bolt Attachment, 153.

CORRESPONDENCE.—Mining at West Point; Ophir, Utah Territory; Banner District, San Diego Co., 146.

MINING SUMMARY.—Reports from Mines in various States, Counties and Districts; Stock Reports; Markets. Etc., 148-9.

MECHANICAL PROGRESS.—Wood Carving by Machinery; Fireproof Wood for Buildings; Coating with Varnish, 147.

SCIENTIFIC PROGRESS.—Spiral Leyden Jar; An Astronomical Problem; Estimation of Graphite: Iron and Cadmium; Consumption of Smoke; Gas Pokers, 147.

USEFUL INFORMATION.—Removing the Odor of Carbolic Acid; Clearing Bean of India; Combining Scents; Curious Customs; Preparation of Hides, 151.

GOOD HEALTH.—The Effect of Light on Smallpox Pustules; Cure of Flatulency; Decay of the Teeth; Cold Cream, 151.

DOMESTIC ECONOMY.—Soap and How to Make It; How to Trap Rats; Good Fried Cakes; How to Choose Butter; MECHANICAL HINTS.—Alloy for Joining Brass to Iron; Architectural Competition in Berlin; Bronzing, 155.

MISCELLANEOUS.—Our Mines on the London Market; Characteristics of Mineral Veins, 146. Hunt & Douglas Process for the Extraction of Copper from Its Ores, 150. The Agriculture of the Mormons; A Chicory Manufactory; Deposit of Mineral Paint, 151. Desilverizing Black Copper; The Wine Interest, 154.

SUGGESTIONS FOR LEVÉE CONSTRUCTORS.—A correspondent. Mrs. Wm. Taylor, suggests as a means of preventing the drying and cracking of the levees, by which the water often finds its way through, that about two feet in width of sand should be filled into the middle of the levees from bottom to top. Such a mode of construction would make them absolutely water tight. Then, to prevent the surface from cracking, it should be covered with six or seven inches of sand as soon as the work has become hard enough to bear the weight of a horse and cart. The sand will act as a mulch to exclude the coöperative action of the sun. A sand or soil suitable for such a purpose can generally be found about 2½ feet below the surface. This remedy only calls for a little more patience and labor, and it is thought that it will be found much more effective and practical, than using the levee as a thoroughfare, for driving stock upon it, as has been suggested

METEOROLOGICAL REPORTS.—The practical value of meteorological reports has been satisfactorily demonstrated by the results accomplished by the U. S. Signal Service during the past year. A comparison between the marine disasters of November and December of 1870 and 1871, shows a falling off from 366 in 1870 to 233 in 1871, and last year was noted for severe and sudden storms. We are glad to see that this important branch of science is properly appreciated in this State, and a bill has been introduced in the Legislature by Mr. Minis providing for the establishment of a meteorological station in every county in the State.

ARTESIAN WELLS IN LOS ANGELES COUNTY.—We learn from an article in the *Star* that there are now about 100 wells in that county, but that half of them are running. One of the best is only 27 feet deep; two are 29 and one 39 feet. These are the shallowest artesian wells in the State. These four shallow wells—a fifth of 92 feet, and a sixth of 135 feet deep—are situated within a radius of four miles, and, together throw up 1,000,000 gallons daily. The average bore of these wells is seven inches.

Our Mining Prospects.

We hear from all parts of the Coast of the prospects of more than an average prosperity in the various gold and silver mining districts. The great scarcity of water that has prevailed during the past two years has had a very serious influence on the mining as well as the agricultural products of this State, and the wonder is that we are able to show such a goodly array of figures in summing up the bullion yield as we have. However, our miners will have no cause to find fault with any scarcity of water this year.

The placer mining interests have suffered more materially than any other, though many quartz mills have been compelled to lie idle or run a limited number of stamps. Now we hear from all parts the good tidings that water is plenty, new mills are going up or are projected, old ones being resuscitated and improvements added, new and improved furnaces being erected in the base metal districts, and ditches being built to supply camps where a scarcity of water has retarded operations, and business prospects look bright everywhere.

California.

In California a number of placer mines which have been abandoned for want of water will be worked to advantage by means of newly introduced ditches. Old districts are being filled with miners who are locating new leads or re-locating old ones which will pay by the processes now in vogue for the extraction of metal. Distant and out-of-the-way places in the State are producing their quota, and localities little known are coming into notoriety. As far north as Siskiyou the placer mines are yielding a goodly quantity of gold and at the extreme southern end, in San Diego county, the two districts located a few years since, bid fair to prove valuable, and that too on their own merits,—little capital being invested there.

Nevada.

The recent rich developments on the Comstock lode in Nevada are calculated to strengthen the idea that this wonderful vein is the best and most permanent fissure vein in the world. It has made for itself a world-wide reputation and is sustaining it well. The metallurgical experience acquired by explorations on that one vein has done more to further the mining interests on this coast than any other one thing. The Washoe process with all its intricacies is well known all over the world The machinery, the results of the labor of inventive genius called for by the requirements of the large bodies of ore of varied character produced by this vein, now enters largely into the metallurgical processes of older countries. A number of new districts have been struck in Nevada, some of which but await the opening of spring to receive a large influx of mining pioneers who seem to be lying in wait for just such chances to "cast their lines in new places" and make a "home stake."

Utah.

In Utah, mining matters, although in their infancy are progressing favorably. She already ranks third in the scale of mineral wealth—California and Nevada only surpassing her. Until the past few years the geological characteristics of that Territory have been but little known, but since the discovery of lead and silver within her borders, the country is covered with nomadic bands and parties of prospectors eager in their search for hidden riches. By the time that this hardy crowd have roamed about for half the time that those of the same class have in California and Nevada we may expect to hear of new and wonderful discoveries and developments that seem to be warranted by present prospects. Utah has already added more than her quota of new districts, during the past year, the accounts from most of which are flattering for future prosperity.

Arizona.

Arizona sends words of cheer intermingled with those of sorrow. Her mines are proving rich beyond expectation; new discoveries are constantly being made and the miners themselves are filled with hopes of future success. But all the news that comes from that remote and half civilized section of this enlightened Republic, contains statements to the effect that not only mining but all classes of industry are seriously hindered by the atrocities of the murderous Apaches. There is no safety for life, limb, or property. Prospecting has to be done in hands or not at all. Peaceable miners in the pursuit of their vocation are shot down, pick and shovel in hand, and no protection is vouch safed by the general Government. The inhabitants saw a glimmer of hope in the arrival of General Crook, whose policy is to exterminate the Indians entirely as the most efficient means of making peace with them, a plan kindred to the sentiments of the residents of the Territory who ought to know what its necessities are. Now, we hear that more "Peace Commissioners" are to be employed and the General's benevolent intentions are sadly interfered with. Well, the authorities know best, of course, but the Commissioners, even after they have made the "most successful and binding treaties" with the fiendish Indians, generally consider it advisable to send requisitions to the officers of the posts for a numerous and well-appointed escort which a private citizen cannot get. This is sufficient evidence of the opinions they themselves entertain of said "treaties."

But how is it with a few poor miners, those pioneers of civilization, many of whose bones lie bleaching on the alkali plains, the result of their unwise prospecting trips. We will hope that some day the Territory will be in a fit state for the entrance of a large number of men who want to go there, but who hear of the enormities committed there and conclude to wait a while. Meantime a few brave and fearless individuals, bronzed and burned by the fierce Arizona sun, contend at the muzzle of the rifle with their wily foes, for the possession of their rights. These are the men who will carry anything through, no matter what, and we expect ere long from the promises she has already given, to see Arizona high up in the list of mineral-producing regions.

Idaho is progressing rapidly; so also is New Mexico. Montana still holds her well-won reputation as a gold-producing territory, and Washington Territory and Oregon furnish a share to swell the general bullion product of the Coast.

Increased Interest.

As soon as the snow is gone from the mountains, parties will be out prospecting, and we may hear of new strikes all over the country. In the older countries in this State, capital is being introduced and developing properties which would otherwise lie idle. The new increased interest in mining affairs is due to recent developments, abundance of water, more efficient management, increased facilities for transportation, improved processes for the extraction of metal and the introduction of both foreign and home capital. Thousands of miners who have valuable mines which have heretofore lain idle will be able to have them developed by this powerful aid, capital.

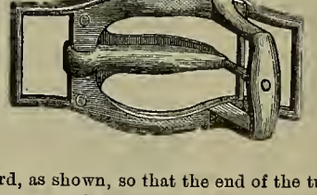
The Coming Year.

The present year will doubtless be the most important one for the mining interests that we have ever had in this country, and with the opening of spring we may look for lively times. This is an acknowledged fact and our capitalists and business men should look to it. San Francisco as the great money center of this Coast should foster this branch of industry as much as possible. Gold and silver must come and mines must be worked to get them. We ought to have the full benefit of all the trade which this industry requires. More attention should be paid to it by affording in this place ample facilities for treating the ores and prevent this wholesale shipment of ore and minerals to Chicago, St. Louis, and Europe. In most of these places, especially in Europeau towns, capital is abundant and cheap, and energy and enterprise not wanting. All we want here is for the capitalists to be alive to their own interests and all the business connected with an industry which produced last year, $80,000,000 in solid coin, will be ours. Hard times are now no excuse; the whole Coast was never so prosperous as when we were distinctly a mining community; the time has come again and let us take advantage of it. The mining interest has been too long in abeyance, and to mining men and mining operations no cold shoulder should be given. There is no pursuit which offers such great inducements and pays as well as mining legitimately carried on.

Improved Tug Buckle.

Any one who has ever had much to do with harness will appreciate the improvement in tug buckles, which our illustration represents. It is sometimes almost impossible to let out or take up a trace, and it can never be done without considerable inconvenience with the old fashioned buckle. If they have been in one place for any length of time they become rusted in, and where the harness is heavy it generally requires some tool to remove the tongue so as to release the trace. The invention represented in our cut is an improved buckle for connecting the trace tug with the hame.

The buckle frame consists of two side bars which are united at each end by rods. One end of each of the bare is turned up-



ward, as shown, so that the end of the tug can pass between the end rod and cross rod which unites the side bars at the point where they are bent. The tongue is loosely attached to another cross bar which unites the two side bars a short distance from the opposite end of the frame, and extends forward towards the cross rod, where it is bent upward so as to pass through the hole in the tug and into a hole in the flat staple plate, between which and the frame the tug passes. A flat spring has one end also secured to the cross bar, and extends forward so as to bear against the under side of the tongue and keep it in place.

The buckle is very strong and can be easily released when desired, in order to change its position. The peculiar construction of the tongue permits the strain to come equare upon the side of the hole in the tug, so that it will last much longer than when the ordinary tongue is employed. A bar provides a fastening for the hame tug so that the two tugs will be connected to the buckle. It will be seen that the tug passes between the two bars without being bent, and is held in that position by the tongue of the buckle. By so doing there is no possibility of the tug getting fixed so as to render it difficult to move. By the tug passing through the buckle without being bent, an important object is accomplished, because it does not wear out so quickly. After a tug has been in one place in the old-fashioned buckle for any length of time, one thickness of the leather is usually worn out, naturally weakening it. By the use of this buckle the harness will last much longer, for this difficulty is entirely obviated, the strain not coming on so small a portion of the leather. This very useful invention was patented through the SCIENTIFIC PRESS agency, by N. D. Fowler, of Valley Ford, Sonoma Co., Cal. Wiester and Co., No. 17 New Montgomery street, are agents.

Our Home Industries.

The Pacific Wire and Wire Rope Co.

The necessities of our community have lately called into existence the above-named company whose efforts to establish a wire manufactory on a permanent basis, have met with successful results. The capital of the company is $100,000, but as yet only $20,000 capital has been called in. The trustees are Jas. B. Stetson (Pres.), J. M. Eckfeldt, Thos. Nelson, Ed. Kruse, J. Gray, A. Furhman and A. S. Hallidie, the latter being Agent of the company.

The works are situated on Brannan street, between Third and Fourth. The main building, two stories high, occupies a space of 35x135 feet. Operations were commenced in October last, since when the weight of wire sold by them has averaged about 20 tons a month. They have 40-horse power available from an adjoining planing mill and give employment to about 20 men. They have at the factory 38 drawing blocks and turn out all kinds of wire from the largest size down to No. 36. The largest made is ⅜ of an inch in diameter and the finest (No. 36 which is four-one thousandths of an inch) would require 250 laid side by side to make an inch.

We saw at the factory a stock of about 100 tons of rods, and there are at the agents about 20 tons of wire, both fine and coarse. There are three annealing furnaces, two large, with a capacity of 3,500, and one small, with a capacity of 1,500 pounds. The drying room is provided with heating apparatus, which enables them to dry about three tons of wire at a time. We saw the process of tinning and also that of coppering wire, the latter of which forms an important branch of the business. The coppered wire is good for making springs for mattrasses, etc., and the tinned wire the broom makers use. The former is run through a bath containing copper in solution, the bundle of wire revolving in it is drawn through the dies two or three times, according to the color it is desired to make it.

All the rods for making the wire are at present imported from England, and one advantage which the company possess is that the import duty on rods is 1¼ cents per pennd while that on wire is 2 cents per pound and 15 per cent. ad valorem. While they import only three kinds of rods, there are 125 kinds of wire used in the trade here. Moreover, the wire is much more susceptible to damage during the voyage than the rods. These rods can be laid down here from 5 to 7⅛ cents, according to quality, while ordinary baling wire sells for about 8 cents per pound, and is made from the cheapest rods. The company are now receiving monthly shipments of about 35 tons of rods.

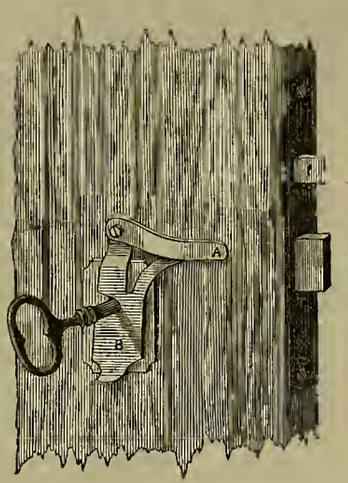
At present they are supplying broom, mattrass, spring, wire rope, and wire cloth makers, and turning out considerable wire for baling and fencing purposes. They propose in time to erect galvanizing works for galvanizing wire. They have so far found more business than their present facilities enable them to meet fairly, and they consequently propose to enlarge the works and increase the capital. At present they have as much to do as they can attend to and find this new home industry a complete success.

AMETHYSTS.—Queen Charlotte's necklace of perfect and well matched amethysts, which was worth $10,000, in her time, would not bring $500 to-day, so rich is the amethyst region of Seven Mountains on the Rhine. May not the increased supply of diamonds, now pouring into Europe from South Africa, and the apparently illimitable supply to come, soon effect a similar depreciation in the value of even that most precious of all gems?

An Improved Bolt-Fastening Attachment for Locks.

The accompanying illustration represents an improved bolt-fastening attachment for locks, which is intended to prevent the possibility of the key being turned from the outside. It may be used on an ordinary mortise door lock. The escutcheon plate, *B*, and the flat spring, *A*, are secured upon the inside of the door, above the keyhole, by the same screw. The spring, *A*, extends at an angle from the keyhole towards the face of the lock, so that its free end will be over the bolt of the lock. On the underside of the free end of the spring, *A*, is a pin which passes through a hole in the door, and also through a hole in the bolt.

The escutcheon plate, *B*, has a spring arm extending upwards towards the spring, *A*, from the side next the face of the lock; and also has a recess cut out of its opposite side which clasps the shank of the key, when the plate is thrown down. When the extremity of the spring arm is pressed down so as to pass under the spring, *A*, the escutcheon plate, *B*, is thrown outward from the key, the extremity or free end of the spring, *A*, will be lifted so as to free



BOLT ATTACHMENT FOR LOCKS.

the pin from the bolt and allow the lock to be operated.

When the escutcheon plate, *B*, is thrown down over the keyhole the spring arm will be freed from the spring, *A*, and stand opposite its edge, thus preventing the removal of the plate, without at the same time pressing the arm downward. The key being clasped in the recess on the side of the plate, cannot be pushed out of the keyhole either when the door is locked or unlocked.

By the use of this device it will be impossible for burglars to open the lock from the outside of the door, as the pin on the end of the spring prevents the bolt being moved either way while the key already secured in the hole prevents the employment of another. The device can be attached to the inside of a door or to the side of a lock and when the bolt is thrown out it will be secured so as to prevent its being turned back to unlock the door by a person on the outside.

The invention is a simple and useful one, and it merits universal adoption, for the key is in no danger of being pushed out and cannot be turned from the outside, while its simplicity and cheapness are also good recommendations. It was patented through the SCIENTIFIC PRESS Patent Agency, by Chas. F. Townsend and A. F. Potter, of Oakland, Alameda County, Cal.

SALES.—Some very valuable mines in Alturas, Idaho, have been sold at good prices to English capitalists, who will immediately put up large mills. It is believed that mining operations will soon be as extensive there as they are now at Owyhee.

British Africa—Diamonds and Gold.

It is now only about two years since authentic information was received of the discovery, in paying quantities, of diamonds in South Africa. Twelve months ago the diamond fields were supposed to be confined to a region of less than 10,000 square miles. Subsequent explorations have already extended them over an area of about 150,000 square miles, or a territory nearly as large as the State of California; and now comes the reported discovery of gold, and that, too, in wonderful quantities!

English Annexation.

The diamond fields were quite outside of the British Possessions proper, or in fact of any other duly established civilized government; but the Cape Colony government claimed a sort of protectorate over the native tribes which inhabited those regions, which soon after the diamond discovery was extended to actual possession. Two colonies of Dutch settlers, engaged in farming and sheep raising, and known as the Orange Free State and Transvaal Republic, were the nearest duly organized European colonies to the diamond fields. A few months only passed before the diamond discoveries were extended to within the jurisdiction of both those colonies, and now, simultaneously with an announced discovery of gold in the latter named colony, we hear that the Cape Colony authorities, acting under instructions from the Home Government, are issuing proclamations (five in number) annexing to the British Possessions portions of both these Dutch Republics—all in fact that is supposed to be valuable for either gold or diamonds. Of the question of right in the matter we know but little; but from papers and documents before us, emanating from these independent governments, we learn that the right is disputed and solemnly "protested" against. Of course the recent discoveries have led to quite an influx of English miners, so much so that they are said to outnumber the Dutch, and may have invited their friends to come in and assume the reins of government. If so, the English rather have the advantage, and will undoubtedly make it another case of "manifest destiny!"

Another California.

It thus seems almost certain that Great Britain has or soon will come into quiet possession of one of the richest and most important regions on earth—another California in fact, worth vastly more than their Australian possessions. The climate of the region is very much like that of California, and it is equally as valuable for the variety and large yield of its agricultural productions. The country is well timbered, and watered by the Orange river—a noble stream larger and longer than the Sacramento, though as yet but little explored. The gold discoveries have been made in the mountains at the head waters of this river and its tributaries; while the diamond fields are located in what corresponds to our foothills. History shows that nothing hastens colonization like the discovery of gold; and with both gold and diamonds, added to a country of unusual climatic and agricultural advantages, we can see nothing but a brilliant future for this latest El Dorado.

The Diamond Fields,

In their geological structure, are very much like portions of the Table Mountain Range of this State—clearly of volcanic drift—pebbly strata intermingled with tufa scoriæ. The diamonds are found in the wash from these deposits, or in the undisturbed deposits where they have been cut through by modern streams.

The "finds" have sometimes been wonderful, and several millions of dollars have already been realized from the diamonds which have been taken to Europe. The precious stones are sometimes found near the surface, but more frequently the diamond-seeker goes down 15, 20 or 50 feet deep to reach the strata in which the object of his search is found. The latter figure is the greatest depth yet opened. The "diggings" are considered quite as good as those of Brazil or even Golconda. The claims—30 feet square—are staked out by government officers, who collect licenses according to the number of hands employed in each claim—about 42 cents for each hand per month. The revenue derived from this source is devoted to maintaining order, which is everywhere preserved. The actual workers are mostly natives who labor for 75 cts. per day or 50 cts. and rations. There is no danger of the natives stealing the diamonds, a very severe penalty is put upon any person buying a diamond from a native, and they can go no where else to sell them.

The strata in which the diamonds are found when first brought to the surface is very hard. It soon, however, "slacks" and is then washed in rockers, similar to "gold rockers." The heavy matter resulting from these washings, and which is saved to examine for diamonds, consists mostly of fine red gravel and variously colored stones, similar to those found upon the the beach at Pescadero, and upon the banks of the Sacramento at Martinez. This matter is dried and spread out upon a table where it is thoroughly examined for diamonds; which is usually done by the claim-holders or members of his family; many of the diamond-hunters being heads of families who have heretofore resided in the vicinity of the mines or in Cape Colony from 300 to 600 mile to the south. The diamonds by working are entirely separated from all dirt, and generally come out bright and clear as drops of water. They however require cutting and polishing to bring out the glitter and sparkle of the true diamond.

At the Mineralogical Museum of Mr. Henry G. Hanks, 649 Clay street, specimens can be seen showing the geological character of the region. At that place may be seen a specimen of the "upper crust" as it is called, which lies immediately under the loose soil; then the material in which the diamonds are found, corresponding to the "cascahalo" of Brazil, which is seen in the siftings or residue of the washing of this substance, showing the minerals with which the diamonds are associated, and which, it will be seen, is identical in character with the well-known Pescadero pebbles. The diamonds themselves, however, are not to be seen—they are rather too valuable for even such a wonderful cabinet as is exhibited by Mr. Hanks. These specimens were obtained from Mr. J. W. Riley, who has recently returned from the diamond fields.

Order and Quiet

Everywhere prevails. No work is done on the Sabbath; the native colonists, who by their number give character to the community have ever been a quiet, industrious, law-abiding people, respecting the laws of both God and man, and always keeping the Sabbath day holy. The English authorities insist upon continuing this custom. The consequence is that life and property is as safe there as in any part of the world.

The Gold Discovery.

As already noted, those discoveries have been recently made and are now confirmed. The gold is found in the Transvaal Republic, along the upper waters of the rivers, above the diamond fields, in a range of mountains quite as extensive and elevated as the Sierra Nevada, and very closely resembling them in direction, position with regard to the sea, and general geological formation. The gold thus far discovered is upon the slope opposite to the sea, or inland. But there is good reason to expect that it will also be found on the opposite or seaward slope. The gold is found in latitude 25 degs. S. and longitude 107 E. from Washington. It is found in both gravel and in quartz. The gravel (surface) is reported very rich and coarse. Several quartz ledges have been found which show rich gold upon the croppings. None, at last accounts, had been explored beneath the surface. About a ton of the quartz and some of the gravel had been taken to Natal for examination and proof of the reality of the discovery; and many persons are leaving for the mines. We gather these facts from extracts from the Transvaal and Natal papers, and from information furnished by Mr. Riley.

How to Get to the Diamond Fields.

There are several well established lines of stages, one or more of which are under Yankee management, with "Concord Coaches," running from the various ports of the Cape of Good Hope Colony, with distances varying from 600 to 750 miles—fare about $75. The Cape ports may be reached by sailing vessels which are frequently leaving Boston or New York, either direct or to touch there. There is also a regular steampship line from Southampton, Eng., to Cape Town and Port Elizabeth—fare $150, time, 50 days. Provisions, clothing, etc., can be purchased as cheap at the Cape ports as in England or New York.

Golden Chariot Mining Co.

The annual meeting of the Golden Chariot Co. was held on the 4th inst., and the following Trustees elected: S. Steinhart, G. L. Bradley, A. J. Bryant, D. Fay, S. Linkton, C. W. Fox, and A. H. Lissak Jr. The Secretary's report shows the following items:

RECEIPTS.

Cash on hand, February 1, 1871	$60,954
Assessment	80,000
Bullion production	396,653
Miscellaneous	5,393
Overdrawn in bank	4,084
Total	$547,084

DISBURSEMENTS.

Dividends to stockholders	$130,000
Golden Chariot Stull Company	20,234
General expenses	11,921
Milling	133,280
Hauling	24,039
Labor	143,871
Supplies	48,205
Freight on treasure	7,167
Miscellaneous	26,548
In the hands of the Superintendent	1,819
Total	$547,084

The miscellaneous disbursements embrace assaying, exchange, freight on supplies, machinery, interest, office rent, etc. The total assets amount to $74,903 against $19,-084 liabilities.

PROSPECTORS from Chico have struck a good lead on the Bidwell road, about 25 miles from that place.

Domestic Economy.

Soup, and How to Make It.

It is, I thiuk, mnch to be regetted that good eoup is unknown in nine houses out of ten; for the wishy-washy, greasy liquid which ignorant cooks, who have no knowledge of the science of cookery, impose upon their employers, is not soup at all; and one might just as well imhibe the water in which the dishes of yesterday's dinner were washed. The unwilling guest is too often forced to partake of a nauscous and indigestihle composition, which annoys the palate, and agaiust which the stomach will revolt. How much better it would be to commence dinner with some plainly dressed but wholesome fish, or a thick soup, which can he achieved by any tolerable cook; but to mako a good clear soup requires experience and skill, and a certain amount of knowledge of the chemistry of gastronomy. A good clear soup is a *chef d'œuvre*, and is infallibly the work of a culinary artist of no mean order. Stock is the basis of all soups; it is the soul of cookery; and it is hardly to be expected that one with but a smattering of culinary knowledge (most cooks knowless of cookery than anything else) should yet be able to uuderstand its vital principle.

Thick soups are useful for luncheon; and when a substatial meal is required they are better calculated to satisfy the appetite; whereas thin soups, to a certain extent, only excite it. Hence, when other things are to follow, and it is not intended to choke off the guest at first, a clear soup tends to stimulate the appetite to further gastronomic delights, whilst a thick soup is calculated to cause repletion, and so to prevent the palate from enjoying those pleasures which the art of cookery, with a lavish hand, presents to its consideration.

The skillful amalgamation of materials, aided by knowledge of the eseential prinplee of culinary chemistry, coustitutee a judicioue combination of subtle esseuces and mysterious flavors, all evident, but none predominating—an harmonious and delicate mixture of vegetable and animal juices, which the enraptured epicure denominates soup. The etock, the cornerstone of the fahric, should be made of good fresh meat; the stock-pot ehould be gradually heated to the boiling point, and vegetables, etc., added; it should be well skimmed and cold water should be occasionally thrown in to facilitate the rising of the scum, as this proces of skimming is essential to the making of ~good soup. The kind of meat should he either leg or shin of beef; the meat should he cut off the bone, and the bone should be chopped. The stock-pot ehould not be allowed to boil again, but should be gently simmered for five or six hours; and by this process the full flavor is extracted hoth from the meat and from the vegetables.

Stock, too, should always he made the day before it is required to be used for soup, as the fat will, when cold, settle upon the top of it in cakes, which are very easily removed. Bones of fowls, game, rabbits, or meat trimmings, may be used in addition to leg or ehin of beef in the preparation of etock; but to make it for white eoupe it must necessarily be white, aud so veal, fowl, aud rabbit only aro admissible in making white stock. I think that soup is worthy of occupying a high place in the scale of culinary education, and a prominent position in the study of dietetics, when it is remombered that the osscnce of meat is rendered more palatahlo and digestible when mixed with other essences aud flavors.—*Ex.*

Cooking Food Below 212° F.—Dr. Jeanel. From a series of experiments, it appears that food (meat as well as vegetahles) hoiled at 200° is more nutritious and of hetter flavor than when boiled at or above 212°. The author illustratee this point by what takes place in mountain localities (every 100 metres' rise above the sea-lovel makes a differnce of 0.6° less in the boiling-point of water); as, for instanco, at Potosi, Bolivia, at 4,061 metres above sea-level, the water hoils at 187°; at Mexico, 2,277 metors ahove sea-level, water hoils at 198°; at Briancon, France, 1,321 metres above sea-level, at 184°, also by the action of the so-called Norwegian cooking apparatus.

A Substitute for Butter.—It may interest many of our readers to know that the demand for clarified hcef suet, as a substitute for hutter for cookiug purposes, is increasing. It is sold in London for half the price of the best butter; and it will keep good much longer, without the admixture of ealt.

How to Trap Rate.—These vermin are often a sore pest to houeekeepers, and any new idea which will lead to their extermination is alwaye of interest. A correspondent of the Germantown *Telegraph* writes as follows: "To keep rats within endurahle bounds is somewhat a difficult matter, for a rat is as cunning as a fox, and as hard to catch; but there is such a thing as working strategy on it. A rat never digs a hole without it has some projection to begin with, eay a stone, a stick of wood, or anything elee that makee an angle with the ground; a cellar wall it likes the heet. If a rat is chased in a cellar, or other room, it will run round by the wall, and is decidely averse to leaving it. From this hahit we have a hint how to out-general it. The common steel-trap is the best article for the purpose. Stand a barrel or box, or other article, within four inches of tho wall, and in that open space set the trap, without anything to hide it. The rat, in following the wall, will go into the trap rather than go round the barrel. When it is caught, emoke the trap with a piece of burning paper, ehift your barrel to another place and eet the trap as before.

Good Fried Cakes.—A correspondent of the *American Rural Home* furnishes that journal the following: Take one-half cup of eugar; one cup of sour cream; one egg; one tea-spoon full of cream of tartar; one tea-spoon full of soda, and a little ealt. First beat the egg, then add the eugar, etirring to a creamy consistency; dissolve the cream of tartar and soda together in a cup of cream and add to the egg and sugar, etirring in the flour until the mass becomes quite stiff. Then flour the moulding-board, turn upon it the dough, work in as little extra flour as possible in getting the mass to a proper consistency for frying. Sweet cream or milk may be uscd when sonr cannot be had.

How to Choose Butter.—Put a knife into the bntter if salt, and smell it when drawn out; if there is anything rancid or uupleasant, it is bad. Being made at different time, the layers in casks will vary greatly, and you will not easily come at the goodness but by unhooping the cask, and trying it hetween the staves. Fresh butter ought to smell like a nosegay, and be an equal color all through; if sour it has not been washed enough; if veiny and open, it has been mixed with an inferior sort.

A solution of three parts of borax and two and a half parts of eulphate of magnesia will render dress fabrics fire-proof.

Mechanical Hints.

Alloy for Joining Brass to Iron.—The difficulty of uniting iron to brass lis created by the unequal rate of expansion in the two metals, which destroyes the unity when the temperature is changed. There is an alloy of copper for which the inventor claime that its expaneion by heat is so eimilar to that of iron and steel, that the eurfaces may be regarded, when joined, as permanently united for all practical purposes. The formula is as follows: Tin, three parts; copper, thirty-nine and a half parts; and zinc, seven and a half parts.

Architectural Competition in Berlin. The German government intends to erect a new Parliament house in Berlin, and architecte of all nations are invited to send in designs for the huilding before April 15th next, appending their names, to the Imperial Chancerÿ in Berlin. A prize, amounting to about $4,250 of our money, will be awarded for the accepted design, and emaller premiume will be given for each of the next four, in the order of merit.

Bronzing.—The red bronze seen on some chandelier work ie produced hy dipping the work in nitric acid, in which old rusty nails or iron must have been put. The work is afterwards dressed with Venetian red and stale heer, and well brushed; wiping the mixture off from the most prominent parts. The operation secms simple, but it requires no mean ekill to securo good results and tasteful effects.

French silver lac consiets of very finely divided tiu precipitated from its solutiou by means of zinc. Applied by eome adhesive substance to wood, paper, and metals, it communicates to them a metallic silvery appearance.

Damp walls may ho prepared for paiuting by applying with a brush, while hot, a mixture composed of one pound of glue diesolved in a gallon of water and thickened with red lead.

Desilverizing Black Copper.

A correspondent of the *Mining Journal* describee the process of desilverizing black copper, by a cold salt solution, as practiced at the Tajovaer copper works, as follows: The metal treated at these works consiste of the Altgebirg black copper, free from lead, containing 80—84 p. c. copper, 0.0003—0.00036 grammes silver and 3.7 per cent. antimony; and the plumbiferous roasted copper from the silver works contaiuing 70.80 per cent. copper, 0.0002—0.00025 pounds eilver, and 9.15 per cent lead. Also the cement copper from the mint at Vienna containing 40.60 per cent. copper and 0.0005 — 0.0023 grammes silver.

After having been reduced to a proper condition of fineness, the copper is subjected to a chloridizing roasting in a furnace having a double hearth. The precautione being observed in mixing the ores that the percentage of lead in the copper must not exceed 7 per cent.; that tho subordinate products added shall he divided equally among the different charges to the furnace, and that the differont charges to be roasted are made as uniform as possible. The preliminary roasting is carried on in the upper hearth, and this lasts 5.7 houre, a dark red heat being maintained and the charge continually worked over. Lumps of ore must be prevented as far as possible, as hindering the formation of argentic chlorides. The charge is then removed to the lower hearth where the silver is entirely converted to argentic chloride at a high red heat. At this period those portions rich in silver (e. g. cement copper) are added, which it is desired to roast as ehort a time as possible.

In order to decompose the antimoniates and arseniatee formed and to volatilize the antimony, about 4 per cent. of coal dust is added in three charges, at intervals of half an hour. The last roasting ie intended in part to change the salte and chloride of copper aud iron to basic salts and oxides. After the roasting has been completed the fire is withdrawn and the charge gradually cooled for half an hour, heing continually raked over; after which it ie formed into a pyramid and left to the action of the chlorine for auother half hour. After this the charge is withdrawn from the furnace, having gained 30.33 per cent. in weight by oxidation and chlorination, and is spread out on iron plates. After becoming cold the ore is passed through a rotary sieve to separate the lumps formed. The silver is extracted by a sodium chloride eolution, having a density 22° B., and temperature of 12°—20° C., in order to entirely dissolve the argentic chloride, which temperature must be maintained in the room for the workmen in the winter, so that the solution requires to be heated but very seldom. The silver is precipitated by granulated copper aud the copper by iron. The eodium chloride dissolves most of the silver within the firet two hours, which gradually decreases so that in the thirtieth to the thirty-third hour it contains but a trace of it.

The Wine Interest.

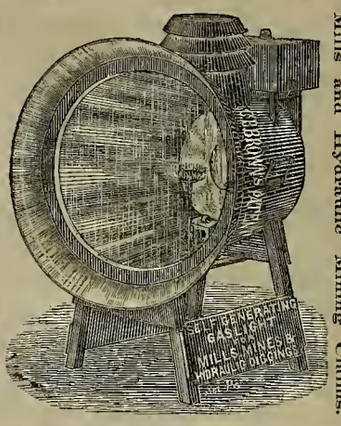
The Napa *Register* collatee the following touching the wine interest: "The product of the principal wine districts of the south of Europe—the south of France—the Rhine and Moselle in Germany—is largely deficient, both in quantity and quality. In Portugal and Spain, including their depeudencies, the Azore and Madeira islands, the quantity is ehort and the quality poor. In Hungary the quantity is fair, but quality very poor. In ehort, the vintage of 1871 is almost a failure in all these districts from which our country has hitherto drawn its supplies. As a natural result of this failure, our California winee will be in demand. The foreign market being short, we mnst supply the demand in the Eastern States; hence, the prices of native wines muet rapidly and materially advance. Indeed, we learn that speculatore are now paying thirty-five cente per gallon for Mission wines, which have heretofore commanded no more than twenty-five cents; and wines of foreign variety are advancing accordingly."

The engineer of the Alexandria, Va., hydraulic steam fire-eugine, while cleaning out his apparatus a few days ago, found three live fish in the pumps. They had undergone some rough treatment since they left the street mains, having lost all their ecales, and a portion of their tails, but othorwise were apparently in good conditiou.

Miners, mechanics, write for yonr paper.

BROWN'S PATENT LAMP.

BROWN'S PATENT LAMP, FOR Mills and Hydraulic Mining Claims.



One of these Lamps, when placed at a distance of 200 feet from the bank, will light up a hank surface 250 feet in length and 100 feet high, and to a much better advantage than any other light heretofore tried, and at an expenso not te exceed fivo cents per hour. Lamps furnished at short notice.

JOHN TAYLOR & CO.,

IMPORTERS OF AND DEALERS IN

ASSAYERS' MATERIALS,

Chemical Apparatus and Chemicals,

Druggists' Glassware and Sundries,

PHOTOGRAPHIC GOODS, ETC.,

512 and 514 Washington street, SAN FRANCISCO.

We would call the special attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our large and well adapted stock of

ASSAYERS' MATERIALS

—AND—

Chemical Apparatus,

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Ceast.

WE ENUMERATE IN PART:

Assay Balances—L. Oertlings, London.
Assay Balances—Becker & Sons, Antwerp.
Chemical Balances—Becker & Sons, Antwerp.
Ore or Pulp Balances—Becker & Sons, Antwerp.
Assay Weights—Grains and Grammes.
Bullion Balances and Weights.
Humid Assay Apparatus.
Iron Furnaces—Improved, Lined with Firo Brick for Cupelling and Melting.
Tongs, Muffles, Cupel Moulds, Assay Moulds, Scorifiers, Roasting Dishes, Annealing Cups, French Clay, Assay Crucibles, Hessian (or Sand) Crucibles.
Dixon's Celebrated Black Lead Crucibles and Covers—all sizes.
Assayers' and Chemical Glassware and Assayers' Hardware—a full assortment.
Steel Stamps for bars cut to order.

ACIDS AND CHEMICALS.

Acid in carboys and bottles, commercially and chemically pure.
Bi Carb. Soda, Borax, Bone Ashes, Litharge.
Assay Lead in bars, rolled and granulated.
Black Oxide Manganese, Sodium and Sodium Amalgam, Sulphate of Copper, Quicksilver, and all Chemicals and Reagents required by Assayers and Milling Co.'s.

☞ Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in Grains and Grammes, will be sent upon application.

24v23-tf JOHN TAYLOR & CO.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

☞ For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will he spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam hottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco.

GOLD-SAVING

Silver-Plated Amalgamating Plates

FOR MINERS AND MILL MEN,

Dupont's Gunpowder, Safety Fuse,
— AND —
WINCHESTER REPEATING ARMS.

Dupont's Superior Mining Powder (saltpetre), F-FF FFF.
Dupont's Blasting Powder, in air-tight corrugated Iron Kegs, C-F-FF-FFF.
Dupont's Celebrated Brand, Diamond Grain, Nos. 1, 2, 3 and 4, in 1 lb. and ½ lb. canisters.
Dupont's Unrivalled Brands, Eagle Duck and Eagle Rifle, Nos. 1, 2, 3, in half kegs, qr. kegs, 5 lb. tins, and in 1 lb. and ½ lb. canisters.
Dupont's Standard Rifle, Fg-Fg-Fg, in kegs, half kegs and qr. kegs, and in 1 lb., ½ lb., and ¼ lb. canisters.
Dupont's Superior Rifle, F-FF-FFF, in kegs, half kegs, qr. kegs, and in 1 lb., ½ lb. and ¼ lb. canisters.
Dupont's Cannon, Musket, Meal and Fuse Powder.
WINCHESTER REPEATING ARMS (Henry's Improved) and FIXED AMMUNITION.
A large and complete stock of these celebrated arms constantly on hand, to wit:
Repeating Sporting Rifles—Oiled Stocks.
Repeating Sporting Rifles—Varnished Stocks.
Gold, Silver and Nickle-plated Rifles—beautifully Engraved.
Repeating Carbines—Oiled Stocks.
Muskets—Angular or Sword Bayonets.
Full stock constantly on hand of all the different parts of these Arms.
Cartridges in cases (Brand H), manufactured by the W. R. A. Co. expressly for their arms.

A FULL AND COMPLETE STOCK
—OF THE—
Above Named Merchandise
Always on hand and for sale by
JOHN SKINKER, Sole Agent,
6v24-6m-1amr 108 Battery street, S. F.

The California Powder Works
No. 314 CALIFORNIA STREET,
SAN FRANCISCO.
Manufacturers and have constantly on hand
SPORTING,
MINING,
And BLASTING
POWDER,
Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.
We have been awarded successively
Three Gold Medals
By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.
We also call attention to our
HERCULES POWDER,
Which combines all the force of other strong explosive now in use, and the lifting force of the NEST BLASTING POWDER, thus making it vastly superior to any other pompound now in use.
A circular containing a full description of this Powder can be obtained on application to our Office.
16v20-3m JOHN F. LOHSE, Secretary.

THE IMPROVED
AMERICAN VAPOR STOVE.

No Wood, Coal, Smoke, Ashes, Stovepipe nor Chimneys, and Perfectly Safe. Economy and Convenience combined.
WILLIAM FRIEL, Manufacturer,
No. 69 and 71 Fourth street, S. F.
All kinds of Lamps altered to burn Patent Oil with or without chimneys. Gasoline and Patent Oils for Stoves and Lamps for sale. County Rights for sale.

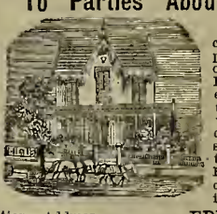
To Parties About Building.



A person who is competent to prepare plans and take charge of the construction of Dwellings, Mills, Bridges, or other architectural improvements, will make favorable engagements with persons or corporations in the city or the interior. Has had full experience on this coast, and can insure good satisfaction. Address EDW. W. TIFT,
5-v24-8a No. 807 Howard street, San Francisco.

$1,000 REWARD
For any case of Blind, Bleeding, Itching, or Ulcerated Piles that DE BING'S PILE REMEDY fails to cure. It is prepared expressly to cure the Piles and nothing else, and has cured cases of over 20 years standing. Sold by all Druggists. Price, $1.00.
8v24-1y C. F. RICHARDS & CO., Agents,
Cor. Clay and Sansome streets, San Francisco, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co's. Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

Device for Steadying Wagon Poles.—Reuben Seadens, San Francisco, Cal. This invention relates to a device for steadying the poles of wagons and more particularly of heavy trucks, to prevent them from striking the horses when passing over cobbles, or uneven surfaces, and it consists in the employment of two cylinders containing elastic springs. A rod from the hames on the harness of each horse passes through one of these cylinders so that the elasticity of the spring shall be utilized by any strain brought upon it. The other end of the cylinder is connected with a bar upon the top of the pole by means of a rod and link or ring and the horses are thus much relieved from the successiou of blows from the pole.

Metallic Filter.—E. J. Fraser, San Fraucisco. This invention cousists in the employment of a series of screws of amalgamated wire cloth or other suitable substance which are cut into the form of the containing vessel into which they are packed, one above another, until they have a considerable thickness. The tailings or slum containing the float gold are then passed through this filter which detains the gold and can be cleaned up in the usual manner at any time.

Air-Exhausting Apparatus for Preserve Cans, Etc.—D. N. Phelps, San Leandro, Cal. This invention relates to an improved apparatus to be employed in connection with an air pump for the purpose of exhausting the air from cans, jars and other vessels. And it consists mainly in so constructing and arranging the receiver or covering vessel, that the orifice through which the air is extracted from the jar, can he closed before removing the receiver from over it.

New Incorporations.

The following have filed certificates with the County Clerk, San Francisco.

Keystone Quartz M. Co.—March 1. Location: Sierra county. Capital stock, $1,000,000, in shares of $100 each. Trustees—H. Scammon, H. D. McCarty and L. F. Harris.

Pacific Proprietary Medicine Co.—March 2: Capital stock, $1,000,000, in 50,000 shares. Trustees—Mark Brumagim, J. H. Fish, R. Goodwin, J. P. H. Wentworth, J. C. Dixon, L. Lanszweert and Wm. A. Coggeshall.

Calaveras Hydraulic M. Co.—March 2: Location: Calaveras county. Capital stock, $3,000,000, in 30,000 shares. Trustees—J. P. Shear, Henry C. Lee, W. H. Knight, Ahram Shear and Geo. R. Eckley.

Alaska Consolidated M. Co.—March 2. Location: Coleman Mining District, Lyou county, Nevada. Capital stock, $1,500,000 in 15,000 ehares. Trustees—H. T. Wheeler, H. P. Wakelee, H. C. Kibble, C. Coats, J. H. H. Williams.

Constitution Tunnel M. Co.—March 4. Location: Ely District, Nevada. Capital stock, $150,000, in 15,000 shares. Trustees—J. B. Cavallier, John Cahill, E. J. Baldwin, Richard O'Neill, C. N, Fox.

Lehigh S. M. Co—March 5. Capital stock, $3,000,000, in shares of $100 each. Location: Pioche District, Lincoln county, Nevada. Trustees—George W. Smiley, Charles M. Chase, M. G. Gillette, George D. Roberts and Maurice Schmitt.

An Explanation seems due from us in regard to a failure to correct a mistatement occurring in an advertisement of Messrs. Treadwell & Co., in the Press, which notice affirmed that the Blake Patent Steam Pump received the first premium "at the *last* Mechanics' Institute Fair." After the advertisement appeared in the Press, Messrs. Treadwell & Co. sent to our advertising compositor direct (instead of to our business office) quite a number of corrections in pencil marks, together with the word *last* in the above quotation blotted out in colored ink. Not being marked in usual printer's style, but in a different, although conspicuous color, the intended erasure was not noticed by the compositer, and the change consequently not made. Mr. A. L. Fish, agent of the Knowle's patent pump, visited us last week with his card, which was published in our last issue, (and which will partly explain the uecessity of this paragraph) and asked us if such correction had been sent to our office, and we iuuocently and confidently asserted the negative. While we do not consider our compositor reprehensible for the omission to make the intended correction, we must say we sincerely regret the unpleasant occurrence, which was unquestionably brought about hy the above misuuderstanding.

The Giant Powder Question in Grass Valley.

Our readers will learn the coudition of the giant powder question in Grass Valley hy reading the following, which we condense from the G. V. *Union* of the 5th inst:

Sunday evening last, the miuers working under ground in the Eureka mine concluded to strike. The idea was to stop the use of giant powder in the mine. Mr. Watt, the Superintendent, talked to his men, and tried to show them the unreasonableness of such demands. He gave them until yesterday to consider the matter and asked them uot to act hastily on the suhject. The men went to the dry house and talked the matter over. A majority concluded at once to quit work. Some, however, saw the justice and the reason of Mr. Watt's position, and voted against the strike. The majority ruled, however, and the men were paid off and left. Yesterday morning several who left on Saturday went into the mine as usual. All who went down were distinctly iuformed that they did so with the full and perfect understanding that the mine must always be worked as the Superintendent directed.

Suhsequently the men who went underground concluded they were not safe in workiug. Some of them remarked that they were afraid of the Miners' Union. On going outside they met four men who represented themselves as a committee, duly authorized hy the Miners' Union, to have all work stopped in the Eureka mine. Some of the workmen who had just oome out of the mine remarked to the committee that they wauted to work, and the committee replied that if any one worked in that mine it would he the worse for such workers. In other words, the Committee said that the Miners' Uniou would not allow men to work in a mine where giant powder was used.

This committee may not be empowered to act for the Miners' Union but they pretend to do so. The Miners' Union must repudiate the act of the committee of four, or the Miners' Union endorse the same. The citizens of the town are prepared to meet all emergencies. There will he no Amador war in this case. That sort of a war requires a great deal of red tape. This war will he shorter and very much sharper than the Amador affair. The men who want to work can go into the mines with perfect safety. The country will protect them.

Mechanics' Institute.

The quarterly meeting of the members of the Mechanics' Institute was held on 2d instaut. President Hallidie submitted his report and said that the committees to whose charge the various interests of the society were committed had fulfilled their duties satisfactorily. A new catalogue of the library is being made out, large additions haviug been made to it.

Patent Office Matters.

The commissioner of Pateuts has designated the Mechanics' Institute as the place of deposit, in the city of San Francisco, for the Patent Office weekly reports, and through the efforts of John O. Hanscom, one of the Trustees of the Institute, a large number of models have been presented to the Society hy the Commissioner, and will shortly be received and displayed for the benefit of all concerned. From the British Patent Office the Society has received the complete abridgement of specifications from 1542 to 1867; also complete indices and other documents of valne to the inventor. The Trustees are still making an effort to ohtain the British Patent Office Reports in full. These reports cover the whole ground of patented inventions in Great Britain from the earliest time, and consists of ahout 2,500 folio volumes.

The affairs of the Institute are in a satisfactory condition. The library is hereafter to he open on Sundays from 2 until 9 P.M.

There is considerable excitemeut in Carrsville, Ky., over the discovery of rich deposits of lead aud other ores at that place.

On File.—Communication "from L. P. Mc.;" letter from "W. M. E."

Rainfall at Turlock, San Joaquin Valley.

Eds. Press:—The amount of rain for the season to date in this portion of San Joaquin Valley is as follows:

To January 1st	8.52 inches.
For the month of January	2.22 inches.
For the month of February	2.42 inches.
Total for the season	13.16 inches.

To compare with former years:

Total rain to March 1st, 1869	9.93 inches.
" " " " 1870	6.35 inches.
" " " " 1871	4.80 inches.
" " " " 1872	13.16 inches.

It may he well to mention that all measurements of rain at this point have been made with the same gauge each year, and that the instrument used is the brass cylinder gauge of the Smithsonian Institute at Washington. The same instrument having been used constantly here, we are enahled to compare faithfully the past four seasons in our locality. It is seen that to date we have had nearly three times as much as fell to this date last year; more than twice as much as in 1870, and nearly one-third as much again as fell in 1869 to March 1st. Between five and six inches fell after thie date in the spring of 1869; hence we have good reason to expect not far from 20 inches as our total rainfall here for the present season—certainly something hetween 17 and 22 inches. Indeed, everything continues to indicate just such an average season as has followed our dryest years for three succeeive periode since '49. The effect of these excellent rains, whose distribution is all we could have asked on our sandy soile, is evident in the fine appearance of our grain fields. By the common consent of our oldest settlers, never has the prospect for first-class crops been more promising in San Joaquin Valley

Turlock, Stanislaus county, March 1, 1872. J. W. A. W.

Scientific Press.—The Press has heen one of our best exchanges as a mining journal, and is considered by all as the hest practical mining journal in the United States. It is a finely illustrated, mechanical and industrial newspaper, and the only one of that kind on the Pacific Coast. It is puhlished hy Dewey & Co., who are reliable patent agents for inventors. We can recommend it to our readers. —*Eureka Sentinel.*

RICHARD H. BUEL, Consulting Mechanical Engineer, 7 Warren Street, New York. Advice and assistance given to those who deeire to invest funds in meritorious and valuable Patent Rights. Machinery of all kinds bought and sold. Unusual facilities for testing engines, boilers and other machinery. I refer particularly to Professor R. H. Thurston, of the Stevens Institute of Technology, who has conented to associate himself with me in consultation on matters of special importance. 10v24-13t

The Evangel, Office, 414 Clay street, San Francisco. Terms, $4 per year, in advance. The Evangel is the organ of the Baptist Denomination for the Pacific States and Territories. All efforts on the part of brethren and friends to extend its circulation will be gratefully appreciated. $3, for one year's subscription, will be received from new subscribers, strictly in advance. Address "Evangel, San Francisco, Cal." Sample copies furnished free. 4v3-1ambptf

University of California.—The Preparatory Department is under the charge of five Professors of the University, and six tutors.

Besides the studies of the public schools, Algebra, Geometry, Latin, Greek, German, French, Spanish and Book-Keeping are tanght.

Terms: Board and tuition, 4 weeks, $30. Students received at any time. George Tait, Oakland, Master Fifth Class. se9hptf

$5 to $20 per Day and no Risk.—Do you want a situation as salesman at or near home to introduce our new 7-strand White Wire Clothes Lines, to last forever. Don't miss this chance. Sample Free. Address Hudson River Wire Works, 75 William street, N. Y., or 1 Dearhorn street, Chicago, Ill. 23v1-12mbp

A Package of Flower Seeds will be sent free to every applicant enclosing two stamps for W. B. Dimon Jr., & Co.'s Catalogue of Vegetable and Flower Seeds, Budding Plants and Flowering Bulbs; Brooklyn, N. Y. mar2-4t

Continental Life Insurance Co., 302 Montgomery street, corner of Pine.

ELECTRO-CHEMICAL

Dry Amalgamation.

THE PAUL PROCESS.

This system is now brought to a complete degree of practicshility, aa well as cheap, simple and thorough in operation, and I am prepared to furnish all machinery requisite for working the process from three tons to 100 per day, aud offer my services to the mining community for the overcoming, by this process, of all the difficulties connected with the amalgamation of the precious metals from milling ores—no matter how fine the gold combined, the silver, or rebellious the ore, the bullion always ranging from 950 to 980-1000 fine. Pamphlets explaining process can be had, free of expense, on receipt of address. For furthrr particulars apply to

ALMARIN B. PAUL,
mar9-1t 318 California street, Room 1.

J. R. ANDREWS,
SUCCESSOR TO
F. MANSELL & CO.,
House and Sign Painters,
412 PINE STREET, SAN FRANCISCO,
Three doors above Montgomery st.

F. MANSELL still superintends the Fancy and Ornamental Sign Work.

Country Orders Attended to
With Punctuality, Cheapness and Dispatch.

STEAM POWER.

The second and third stories of the west half of the Mechanics' Mill, corner of Mission and Fremont streets, to let, with Steam Power. Frontage about 70 by 127 feet, but the rear half is only about 40 feet wide. To be let in whole or in part, to one or more tenants.

For further particulars apply to

FRANK KENNEDY,
mar9-2t 604 Merchant street, San Francisco.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the Scientific Press we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Mining Companies

Should advertise their Meetings, Assessments, and Sales, in the SCIENTIFIC PRESS. Rates more than one-half less than daily publications. Stockholders should take the hint and request their managers to truly economize by advertising in a MINING JOURNAL, where all notices may be seen by cheaply purchasing and examining a weekly. You will thus save money and uphold a journal which upholds your interests.

Kincaid Flat Mining Company—Location

of works, Tuolumne County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 14th day of February, 1872, an assessment of three dollars per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at his office, No. 220 Clay street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 18th day of March, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 8th day of April, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

R. H. CORNELL, Secretary.

Office, 220 Clay street, San Francisco. fe24-td

Pocahontas Gold Mining Company—Location

of works, Mud Springs, El Dorado County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 26th day of February, 1872, an assessment of Five Dollars per share was levied upon the capital stock of said company, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room No. 26, Hayward's Building, No. 419 California street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on Saturday, the 6th day of April, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before will be sold on Monday, the 6th day of May, 1872, to pay the delinquent assessment thereon, together with costs of advertising and expenses of the sale.

D. A. JENNINGS, Secretary.

Office, Room No. 26, Hayward's Building, 419 California street, San Francisco, Cal.

February 26, 1872. mar2-5w

Quail Hill Mining and Water Company---

Location of works, Salt Springs Valley, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 15th day of February, 1872, an assessment of $5 dollars per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary, at the office of the Company, No. 409 California street, up stairs, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 26th day of March, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 16th day of April, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees. T. F. CRONISE, Secretary.

Office, 409 California street, San Francisco, Cal. fe24-td

Silver Wave Mining Company----Location

of works, White Pine Mining District, White Pine county, Nevada.

And in accordance with law and an order of the Board of Trustees, made on the 23d day of January, 1872, so many shares of each parcels of said stock as may be necessary, will be sold at public auction, by Maurice Dore & Co., at No. 327 Montgomery street, San Francisco, Cal., on Saturday the 16th day of March, 1872, at the hour of 12 o'clock M., of said day, to pay said delinquent Assessment thereon, together with costs of Advertising and expenses of sale.

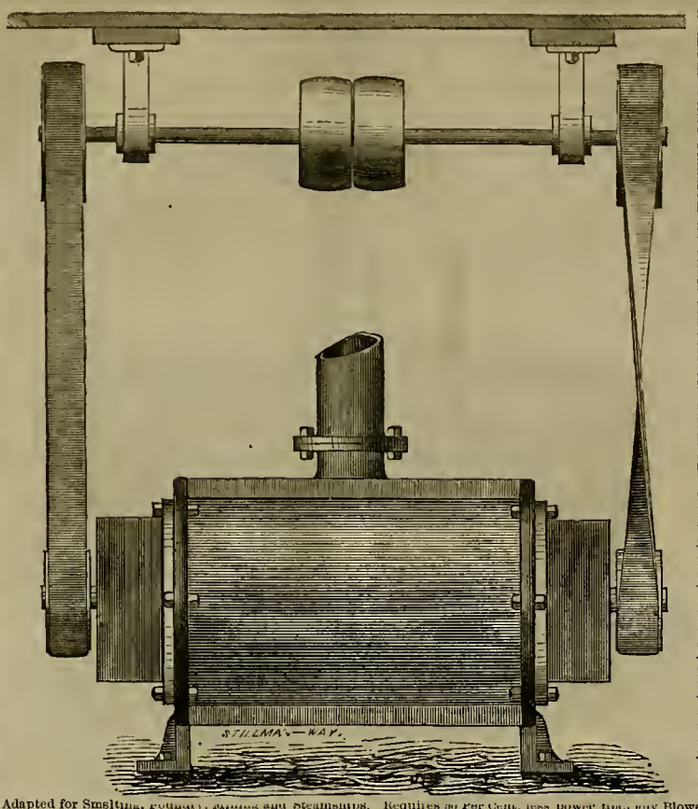
F. J. HERRMANN, Secretary.

Office—516, Kearny st., San Francisco. msr2-3t

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

AWARDED FIRST PREMIUM AT PARIS EXPOSITION—PATENTED NOV. 1, 1864; JULY 21, 1865; OCT. 3, 1865.

MANUFACTURED BY THE GLOBE IRON WORKS, STOCKTON, CAL.



Adapted for Smelting, Foundry, Mining and Steamships. Requires 30 Per Cent. less power than any Blower now in use. A Blower may be seen at W. T. Garratt & Co.'s Brass Foundry, San Francisco; Gould & Curry and Savage S. M. Co.'s, Nevada; and at C. P. R. R. Co.'s Works, Sacramento; and other places on this coast.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

QUARTZ, SAW AND GRIST MILL, IRON, STATIONARY AND STEAMBOAT ENGINES, HORSE-POWER AND PUMPS, OF ALL SIZES.

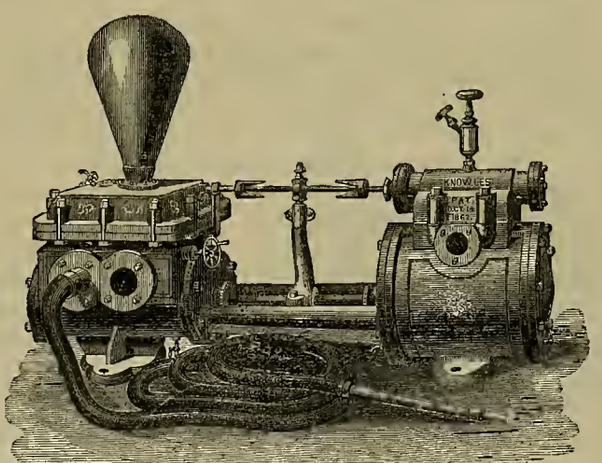
For Circulars and further information, Address

4v2itf GLOBE IRON WORKS, STOCKTON, CAL.

KNOWLES' PATENT STEAM PUMP.

Received the Highest Award---A Diploma---

Over all Steam Pump Competitors, at Mechanics' Institute Fair of San Francisco, 1871; also Special Medal and Diploma at State Fair.



It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.

The trial of Steam Pumps at the Eighth Industrial Fair in San Francisco, by a Committee of Five of the most thoroughly practical mechanics on this coast, showed the Knowles Pump to lose but 11⅓ per cent., while others lost as high as 40 per cent., showing great difference in economy.

CENTRAL PACIFIC R. R., OFFICE OF THE GEN'L MASTER MECHANIC,
SACRAMENTO, Cal., April 14, 1871.

A. L. FISH, Esq., Agent of the Knowles' Steam Pump, San Francisco—Dear Sir: In reply to your inquiry as to the merits of the Knowles' Steam Pump, in use upon this road, I will say that we have nineteen of them in use on this road as firs engines, and pumping water for shop and station use. I consider the Knowles Steam Pump the best in use, and prefer it to any other. Yours truly, A. J. STEVENS, General Master Mechanic.

WE BUILD AND HAVE CONSTANTLY ON HAND

THE LARGEST STOCK OF PUMPS IN THE WORLD,

And for Every Conceivable Purpose.

A. L. FISH, Agent.

No 9 First Street, San Francisco, Cal.

P. S.—All kinds of new and second-hand Machines on hand. 3v24-eow-bp

Piermont Milling and Mining Company---

Location of works, Piermont District, White Pine county, Nevada

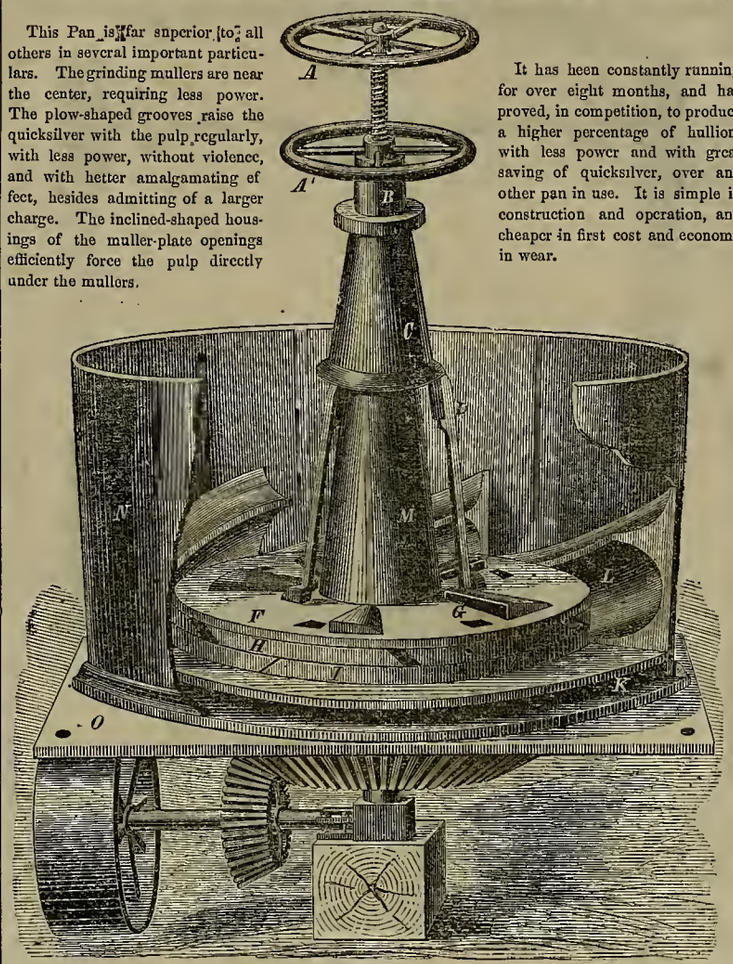
STEVENSON'S PATENT MOULD BOARD AMALGAMATING PAN.

This Pan is far superior to all others in several important particulars. The grinding mullers are near the center, requiring less power. The plow-shaped grooves raise the quicksilver with the pulp regularly, with less power, without violence, and with better amalgamating effect, besides admitting of a larger charge. The inclined-shaped housings of the muller-plate openings efficiently force the pulp directly under the mullers.



It has been constantly running for over eight months, and has proved, in competition, to produce a higher percentage of bullion, with less power and with great saving of quicksilver, over any other pan in use. It is simple in construction and operation, and cheaper in first cost and economy in wear.

Manufactured at the Golden State Iron Works (Co-operative), 19 First street, S. F.

Where it can be examined and further particulars be learned; or persons may apply to the inventor and patentee, Mr. C. C. STEVENSON, at the Douglas Mine, GOLD HILL, STATE OF NEVADA, where the Pans have long been in constant operation. 15v20-1mr,1amtf

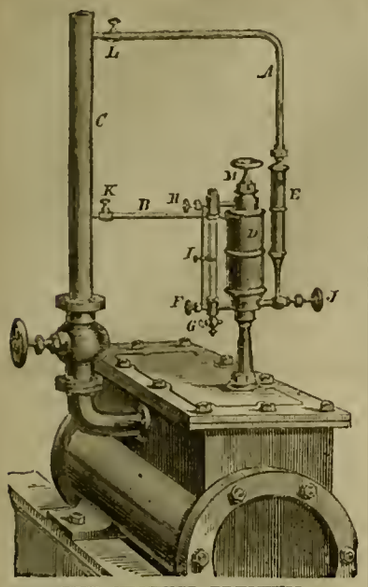
N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the pistou will not corrode. One piut of oil will last from three tn six days, according to speed and size of eugiue: I, sllding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

BLAKE'S PATENT STEAM PUMPS.

WHAT IS SAID BY THOSE WHO USE THEM.

SALEM, Oregon, January 16th, 1872.

MESSRS. BERRY & PLACE, San Francisco—Gentlemen: In answer to your query regarding the working of the large Blake Steam Pump, our company purchased of you, we would say in all sincerity that the pump has *exceeded our expectation*. It has been in use since the 7th of September, 1871, and has thus far given the most perfect satisfaction. It does its work with ease, does not get out of order, and requires but little or no attention to run it. It is SIMPLE, DURABLE, and PERFECT in its construction. We have found it entirely satisfactory and just the pump *in every respect* needed for our work.

Yours, respectfully, W. F. BOOTHY, Pres't Salem Water Works.

PHŒNIX MINE, Napa County, January 10th, 1872.

MESSRS. BERRY & PLACE, San Francisco—Gentlemen: The No. 8, Blake Steam Pump we bought of you last fall is doing good service. We are having a large amount of water to contend with during this stormy weather; but the pump throws it all out of the main shaft (160 feet deap) with perfect ease, and is only working from 60 to 80 strokes a minute. It is a complete pump and no mistake. We are well satisfied with its working, and if you wish to use the name of our company, as a reference, you are at liberty to do so. Very resp'tly, GEO. FELLOWS, Supt. Phœnix Quicksilver M. Co.

OFFICE STARR MILLS, VALLEJO, Cal., January 13th, 1872.

MESSRS BERRY & PLACE, San Francisco—Gentlemen: We are pleased to state that the No. 3 Blake Pump purchased of you, has constantly supplied our three boilers for the past year, with water heat to above boiling point with one of Armstrong's Patent Heaters. It has given us no trouble nor expense, and has in fact fully come up to your recommendations. Yours, Etc., STARR BROS. & CAMPBELL.

OFFICE S. J. WOOLEN CO., SAN JOSE, January 29th, 1872.

MESSRS. BERRY & PLACE, San Francisco—Gentlemen: We have used a No. 6 Blake Steam Pump now for about two years, both as a Tank Pump and as a Fire Pump in case of need: and it has given excellent satisfaction. *It suits us in every respect.* Very respectfully, R. F. PECKHAM, Pres't San Jose Woolen Co.

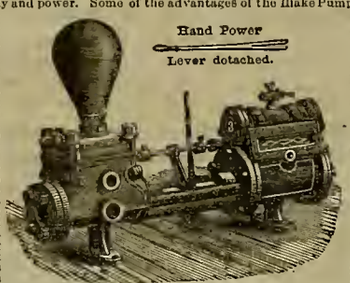
BELMONT, Cal., February 6th, 1872.

MESSRS. TREADWELL & CO.—Gentlemen: In reply to your inquiry concerning the large Blake Steam Pump, purchased of Berry & Place, by Mr. Ralston, I will say, that it gives ENTIRE *satisfaction*, even working as it now is, where no other Pump could; for it is *at present six feet under water*, yet it does its work PERFECTLY.

Yours, Etc., J. E. BUTLER, Supt. Water Works and Engineer at W. C. Ralston's.

BLAKE'S PATENT STEAM PUMP.

These Pumps have been tested, and found to be indisputably without an equal wherever tried. They have been sold in the Pacific States now for nearly three years, and we are willing every one in use may be referred to; every Pump will speak for itself. They are constructed in the most simple style, and built in the most thorough manner—especially calculated for simplicity, durability and power. Some of the advantages of the Blake Pump may be summed up as follows: It is positive under any pressure. May be run slow or fast as may be desired. Will discharge more water than any others of the same dimensions. Has no leaky joints, the steam part being cast in one entire piece. The steam valve is perfectly balanced, is cushioned at each end, and slides with the greatest facility *having no cams, nor complex rotary arrangements to get out of order.* Will start at any point of the stroke, and will discharge all the water of condensation. The Pump has no crank or fly-wheel, thereby saving a considerable item of expense to the purchaser. Having *no dead points*, it therefore needs no watching, and is consequently ready to start without using a starting bar or any hand work whatever. The Blake Pump is extensively used on Railronds and Steamboats, in Hotels; for Mining and Fire purposes; in Breweries, Tanneries, Sugar Houses, Factories, Mills, Laundries, and as Boiler Feeders, wherever steam is employed. In fact, wherever water or other liquids are desired to be raised in large or small quantities, or against heavy or light pressure, it is the cheapest and best Pump that can be used. It is offered to the public as the most perfect independent steam Pump ever invented. Forty different sizes are made, capable of throwing from 1,000 to 200,000 gallons an hour, and adapted to any class of work that may be required. Every pump will be warranted to perform the work required of it by the purchaser, or it may be returned and the money will be cheerfully refunded. The Blake Pump was awarded a silver Medal at the exhibition of the Mechanics' Institute, San Francisco, and State Fair at Sacramento, as being the best steam Pump on exhibition. The agents have recently imported several of the largest-sized Mining Pumps for water works, and deep mines, and will be pleased to refer parties to them; we claim for it, that it is the most simple and durable, and consequently the best Steam Pump ever built. For sale by TREADWELL & CO., Machinery Depot, old stand, corner of Market and Fremont streets, San Francisco, who will be pleased to send circulars to any address, or show its advantages to parties calling on them.



It has no Cams or Rotary Complex Valves. It has stood the test wherever tested.

IT IS SIMPLE, COMPACT, DURABLE, AND POWERFUL.

☞ Manufactured by Geo. F. Blake & Co., Boston, who build and have on hand a larger variety of Steam Pumps than any other concern in the country, embracing *forty* different sizes, and capable of throwing from 1,000 to 200,000 gallons an hour, and adapted to every description of work required. ☞ Send for circular and pricee.

AMBLER'S BLOWPIPE FURNACE,

For Roasting Rebellious Ores.

This new roasting furnace is the CHEAPEST AND BEST yet offered to the public. By furnishing an ample supply of oxygen to the ore while roasting, thorough oxydization of the sulphurets is secured at a small cost.

It is Adapted to All Kinds of Ores.

A description and illustration of this Furnace was given in the SCIENTIFIC PRESS of November 25th.

For terms, circular, and further information, address the agent of the inventor,

MONROE THOMSON,

At 444 California street, San Francisco, until further notice. 5v23-3m

The Scientific Press is the Oldest and Largest Practical Mining Journal in America.

Established in 1860, this weekly has steadily advanced in size, ability and interest. Its chief editors and publishers have had over fifteen years successful experience in conducting this and other journals in California.

Its editorials are carefully prepared with an honesty and accuracy that maintains its reputation as the best authority on mining matters in the country.

It is published in the best location in the world for furnishing the largest amount of valuable information to the gold and silver miners and metallurgists everywhere.

Its correspondents and subscribers are to be found in nearly all the mining districts of CALIFORNIA, NEVADA, IDAHO, MONTANA, UTAH, ARIZONA, COLORADO, and in MEXICO and other foreign countries.

Over 10,000,000 Dollars!

Have doubtless been saved to the miners of the Pacific Coast by reading this journal, each issue of which contains some two pages of MINING SUMMARY from the most important districts in the U. S.; from one to two pages concerning NEW INCORPORATIONS, SHARE MARKET, MINING CORRESPONDENCE, COMMUNICATIONS, etc., and from two to three pages of EDITORIALS (with illustrations) of NEW MACHINERY, NEW DISCOVERIES, PROCESSES, and operations in MINING, MILLING, ROASTING of ORES, ASSAYING, etc.

One feature of our journal consists in presenting in each issue a POPULAR VARIETY of highly interesting matter, useful and instructive for all intelligent readers, systematically arranged in departments under headings entitled Mechanical Progress; Scientific Progress; Mechanical Hints; Home Industry; New Discoveries; Good Health; Domestic Economy, etc., rendering its reading pleasant and profitable at the OFFICE, SHOP AND FIRESIDE.

Yearly subscription $4 per annum. Single copies 10 cents. Four sample copies (of recent dates) furnished for 25 cents. List of California mining books sent free. DEWEY & CO., Publishers, Patent Agents and Engravers, No. 338 Montgomery street, San Francisco.

DEWEY & CO.,

U. S. AND FOREIGN

PATENT AGENCY.

The principal Agency on this side of the continent. Established in 1860. Inventors can rely upon the surety and dispatch of all important and confidential business intrusted in our hands. Long familiarity with Mining, Farming, and all other classes of inventions on this coast, enables us to give the most intelligent advice to PACIFIC COAST INVENTORS of any Agency in the Union, and oftentimes much unnecessary delay and expense. Every branch of the patent soliciting business attended to. All WORTHY INVENTIONS patented by us will be liberally noticed, free, at the most desirable time for the patentee, in both the SCIENTIFIC PRESS and the PACIFIC RURAL PRESS.

Send for our 52-page illustrated PATENT CIRCULAR, mailed free on receipt of stamp. Also the U. S. Patent Law of 1870.

DEWEY & CO.,

No. 338 Montgomery st., S. E. cor. California st., diagonally across from Wells, Fargo & Co., S. F.

H. N. COOK,

Leather Belting and Hose,

HYDRAULIC HOSE, SUCTION HOSE of all sizes, for Mining Pumps.

McAFEE, SPIERS & CO.,

BOILER MAKERS

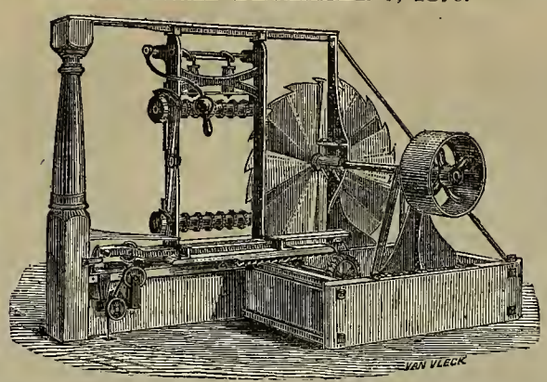
AND GENERAL MACHINISTS,

Howard st, between Fremont and Beale, San Francisco.

Huntington's Improved Shingle Machine.

PATENTED DECEMBER 7, 1870.

MANUFACTURED AND FOR SALE BY F. A. HUNTINGTON, Nos. 18 and 20 Fremont Street, SAN FRANCISCO.



FOR SIMPLICITY, DURABILITY AND RAPIDITY OF action, these Machines have no equal, cutting from 3,500 to 4,000 per hour. They are now used by all the principal Millmen on the Pacific Coast.

These Machines are in use at the Mills owned by the following parties: Macpherson & Wetherbee, San Francisco; Pope & Talbot, San Francisco; Hanson & Co., Redwood City; Rice & Haliburton, Woodside; S. P. Pharis, Woodside; Harrington & Co., Pescadero; Burch & Co., Pescadero; A. Saunders, Point Arena.

Steam Engines, Sawmills, Planing, Lath and Picket Machines, etc., made to order, at short notice.

3v24-1am-6m **F. A. HUNTINGTON**, 18 and 20 Fremont street, San Francisco.

THE GIANT POWDER COMPANY

Are now manufacturing besides the famous regular

GIANT POWDER, A NO. 2 GIANT POWDER,

Somewhat slower in its Explosion, which we recommend for

BANK BLASTING, COAL MINES,

AND FOR ALL SUCH WORK WHERE THE ROCK IS NOT VERY HARD

It is fully as safe as the other and evolves neither smoke nor noxious fumes when exploded.

Price. 50 Cents per Pound.

The sales of both grades increase very fast, which is the best proof of their superiority over other explosives.

BANDMANN, NIELSEN & CO.,
20v22-3m16p General Agents, No. 210 Front Street.

PACIFIC RURAL PRESS,

A FIRST-CLASS

Illustrated Agricultural Paper.

It is one of the Largest, best Illustrated and most Original and Enterprising Agricultural Journals in America, and has no rival on the western side of the Continent. Its circulation is Rapidly Increasing, and it is Very Popular with its Patrons.

A NEW HUSBANDRY,

as it were, is required on the Pacific Coast, on account of its peculiar seasons, soil, climate and topography. The new discoveries, ideas, and useful hints evolved in its rapid progress, are to be observed with interest, and read, as reported in the PACIFIC RURAL, with profit by practical and progressive agriculturists everywhere. Sample copies of the PRESS, post paid, 10 cts. Subscription, $4 a year.

DEWEY & CO., Publishers,

No. 338 Montgomery St., San Francisco, Cal. Nov., 1871

From an Old Inventor.

MARYSVILLE, Cal., March 2, 1872.—Messrs. DEWEY & Co., U. S. and Foreign Patent Attorneys, San Francisco. My Patent, through your Agency, is received. Please accept my warmest thanks for the ability you displayed in obtaining it. Thirty years experience in inventing and obtaining patents has taught me the lesson that *that* patent agency is the cheapest which has the most ability, integrity and energy; and without flattery, permit me to say that I have tried the most prominent patent agents of the Atlantic Coast, and have never had my work so ably done as by your firm. I have carefully reviewed the specifications and claims of my patent, and am unable to find an error, nor would I add a word or line thereto; yet it is the most complicated and difficult invention to specify clearly that I ever invented; still, your lucid specifications and drawings so divest it of its apparent complication, that it may easily be understood by any one. Permit me to say, in conclusion, that the inventors of this coast have cause for just pride in the possession of so able a medium as DEWEY & Co., through which they may obtain justice at the Patent Office.

10v3-1am3t Yours truly, S. PELTON.

VOLUME XXIV. Number 11.

The Proposed New Land Policy.

The new land policy, as shadowed forth by the bills lately introduced by Assemblyman Barker, ought to meet the approval of every sincere friend of the industrial and commercia interests of the Pacific Coast. These bills provide briefly as follows;

First, we have a Joint Resolution asking Congress to resume public lands in California for actual settlers only, under the homestead and pre-emption laws. The effect of that action by Congess would be to stop the wholesale entries of lands and conceutration of whole townships in speculative hands—a policy discouraging to immigration and the material development of the State.

Next we havo an Act reserving all lands belonging to this State for settlers only—a measure like the one asked from Congress, and intended to place a check upon the wholesale absorption by speculators of State, School and Swamp lands.

Then comes an act requiring parties who have bought State lands on credit, and who are not actually living upon and cultivating the same, to pay over to the State the balance due within a certain time on pain of forfeiture. The law under which such sales were originally made authorizes this special legislation.

The fourth and last bill introduced by Mr. Barker, provides that copies of maps and records of State and United States lands, now lying open to preëmption, or unimproved and not paid for, shall be furnished to all County Recorders, for the benefit of the people at large, together with any other attainable information which may become the means of guiding settlers to the selection of desirable land for improvement.

This last bill is a very important matter to the settler, who has neither the time or experience in such matters to properly inform himself, or the means to employ attorneys to do that which the sellers, (in this case, State or National Government) under other circumstances, always do to effect a sale of their property. These bills, together, present a land policy which must commend itself to every well-meaning citizen, who has the welfare of the State at heart, or who is willing to unite in any proper effort to discourage unwholesome land monopolies, and thereby encourage that class of immigration which the State most needs.

QUICKSILVER FUMES.—We hear much complaint with regard to the deleterions influence of quicksilver fumes both from retorting the precious metals and from furnace operations in treating the ores of cinnabar at the quicksilver mines. Mr. William Kringel, who has been for some time employed at the Redington Quicksilver mines, at Knoxville, Napa county, informs us that many are severely troubled in that way at that mine.

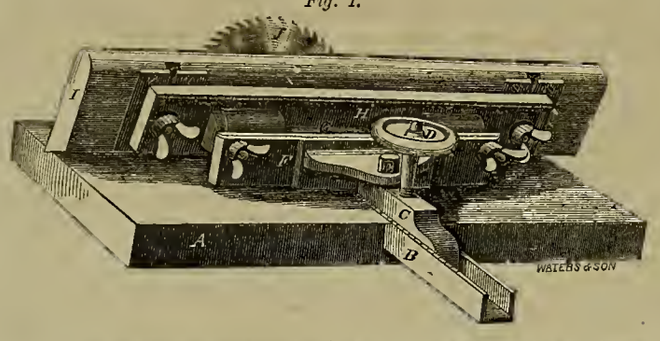
Much care should be taken by firemen and laborers engaged in the furnace operations about a quicksilver mine. One of the great "dangers is in drawing the charges;" which is often done when the ore is red hot, and before it has been fully freed from its cinnabar. The danger of such a practice, to say nothing of its wastefulnesss, ought to be carefully avoided. Mr. K. informs us that men while "drawing," often find so much mercury deposited on their hats that they can shake the globules together and *pour* the quicksilver off. Even if workmen can be found who are willing to stand such an exposure, the interest of the company ought to prompt superintendents and others having responsibility, to see that charges are more thoroughly reduced and cooled down before the furnaces are opened.

Wright's Improved Saw Gauge.

The accompanying cuts represent L. Wright's improved saw gauge for gauging the width of stuff for circular saws, which from its peculiar advantages commends itself to all having use for such an article. It supplies a want long felt by sawyers, the old method being defective in many respects.

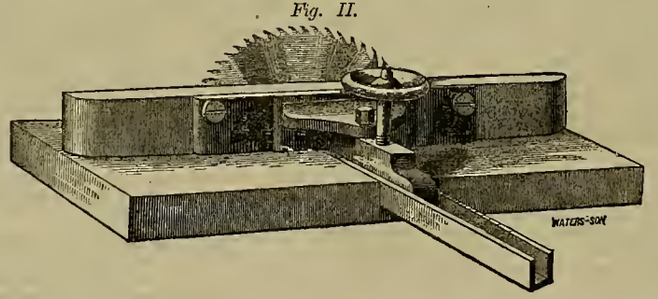
Fig. 1 represents the gauge with the bevel attachment, which can be set at any angle, and is indispensable for moulding mills, and other places where bevel sawing is desired. *A* represents the circular saw table. *B* is a grooved way, which

Fig. I.



is let into the table, flush with the top. *C* is the portion of the gauge to which the fastening arrangement is attached, and slides perfectly free in the grooved way, and can be removed from the way, at any point between the saw and the edge of

Fig. II.



table; thus presenting a perfectly clear top for other purposes. The screw, *D*, terminates with a taper, which when the wheel is turned, forces itself between two pieces let into the slide, *C*, and which presses against the inside of the way, thereby perfectly fastening the gauge to the bench. A single quarter-turn of the wheel releases the pressure, and allows the gauge to slide perfectly free in the way, or to be removed at pleasure. This is the great feature of this gauge, and renders it the most adjustable fixture ever offered to sawyers. The plate *F* is hinged at the end of *C*, so that the face can be adjusted in perfect line with the saw; when once adjusted it is secured in position by set-screw. *E*, *G*, *H* and *I* are the bevel arrangements; the wood *I* can be tilted at any angle, and then secured by the thumb-screws The plain gauge is formed by attaching the fence to the plate *F*, and is shown in Fig. 2. The machine may be seen at the Pacific Saw Manufacturing Co., No. 17 and 19 Fremont street, in this city.

THE SUBMARINE TELEGRAPH cables in China are suffering from the attacks of some minute crustacean, so small as to be scarcely perceptible to the naked eye. Various breaks have been traced to the agency of these animals who imbed themselves in the gutta percha.

Mining Discoveries

Specimens of coal and copper have been brought into Visalia, Tulare county, recently and created no little excitement. A gold ledge has been discovered near there, in Yokall Valley, about 35 miles distant; it is narrow but rich. A silver lead has been found on Smith's mountain at the head of King's River, the ore from which is expected to pay not less than $400 per ton.

The Winnemucca *Register* chronicles the discovery of a rich gold mine, about 10 miles from that place. The claim shows good prospects, some of the rock being covered with fine gold.

The Unionville *Silver State* has seen some very rich silver ore from a recent discovery near that place.

Reports of the discovery of rich deposits of gold in the Black Hills continue to be received. A gentleman who had lately arrived at Sioux City, Iowa, brings rich specimens of quartz and says the Indians have large quantities of gold.

ARIZONA.—A small party of miners who have some time been working in Black Cañon, about 50 miles southeast of Prescott, have been compelled to leave their claims owing to fears of an Indian attack.

Too Wet to Plow.

In several districts of the State where adobe lands abound, the continued rains have made the lands too wet to admit of plowing for wheat at present, and it is becoming a question of great importance to know how late it will do to defer seeding and still hope for a fair crop. Many doubtless will sow wheat much later than they would otherwise have dared, but for the unusual and almost continued rainfall since December. It has so long been the great staple crop of the majority of our grain farmers that they find themselves in difficulty and doubt as to what is best to do.

How late can the common California varieties of winter wheat be sown and mature a crop? Of course very much depends upon the quantity of rainfall between this and the first of May. But, are we to have as abundant late spring rains as heretofore, following close upon our long-continued and almost unprecedented winter rains? These are questions which time alone will determine; it becomes the farmer, therefore, to look around for some avenue of escape from the dearth of pocket likely to occur, if he fails of a fair amount of acres of fully matured and marketable wheat.

In all the Northern States of the Atlantic they sow wheat which is know as spring wheat, as late as they sow oats, or in April to the very last week, and still harvest excellent yields of wheat. It is not too late for our farmers to send for this variety, which can be sown and fully mature its grain, at a season so late that the ordinary wheat of California would be nearly a total failure. It is a wheat so entirely distinct from the other varieties, that it takes its peculiar rank and place in the markets of all the great grain depots of the Northwest. It can be procured in Chicago in any quantity. The only question is, can it mature here, subject to our almost rainless months of June and July?

Buy the Right Fruit.

A subscriber, A. C., writing from Stony Point, Sonoma county, attributes the dissatisfaction felt by the consumers of fruits with the article they purchase, to a want of knowledge of the best varieties; that if they would give more attention to this, and then buy none but of good quality or condition, when put upon the market, very little trouble would ever be felt. He recommends among the apples for family use, the Red Astrachan, Gravenstein, Baldwin, Bellflower; Smith's Cider, Esopus Spitzenberg, R. I. Greening and Yellow Newtown Pippin.

Then he makes the following suggestion on another matter:—"A good way to make dry tough timber more servicable, such as whip stock, axe handles, etc., is to soak them in water for six hours and then use them until dry; by this means you bring the spring into the wood before breaking. Try it!"

GOLD IN THE COLORADO.—Extensive placer diggings have been struck on the Colorado river, above the mouth of the Virgen. A correspondent of the Salt Lake *News* says that half an ounce a day has been made to the hand. Various places have been visited along the river and fine gold has been found at most of them. People seem satisfied that the Colorado will be lined with mining camps before another winter sets in. A number of parties are out prospecting.

CORRESPONDENCE.

Notes of Travel in Yuba County.

[By our Traveling Correspondent.]

Marysville.

The county seat of this county, is situated about 40 miles distant from Sacramento city *via.* rail, not the shortest, but the only routs hy which your city is reachsd at thie writing; the railroad *via.* Knight's Landing and Davieville, hsing completely suhmergsd in places. This city contains about 6,000 inhehitauts, hae two first-clase hotele, the "Western House" and "Dawson House," and in a menufacturing way, is second to none of ite eize, in the State.

Best & Brown's "Separator"

Ie manufactured at thie place, the patent upon which wes obtained through your office. The proprietors of this separator are at present only manufacturing modele, for the purchasers of county rights; 14 men are regularly employed and $20,000 worth of county rights have been disposed of within the last 30 days. It is a portahle machine, costs $500, and has a capacity of cleaning 60 tons of grain, or eeed of any description, daily; it is especially adapted for cleaning harley for hrewers, castor heans, etc,; if a half dozen kinds of grain be mixed, it will separate each, in a different sack. So highly pleased were the Japanese with it, (whsn they visited this city a few wesks since) that they propose to introduce it into Japan to clean rice with. I am satisfied it is a fortune to its owners.

Eureka Gang Plow.

Hill's patent ie enother of the important manufactured articles of this city. Messrs. Hill & Knaugh, proprietors, ere at present working a force of 20 men in the manufacture of some half dozen kinds of single gang and sod-plows. The Eureka eulky plow, a douhle gang, all iron except the pole, is manufaotured at $95 each; with chilled cast-iron points at $85; the Champion deep-tilling stubhle plow at from $85 to $90. They also manufacture a sod or tule plow on trucks, with seat for driver, at from $80 to $90. Several I saw in use, gave entire satiefaction; their plows for gravelly ground (especially made) are a great succees.

Doors, Windows and Blinds.

One of the largest establishments of this class of articles anywhere in the interior of the State, ie carried on at this place hy Messrs. Swain & Hudson; they do a general turning and ecroll-sawing hueiness in addition, and at present are employing 50 men. Their manufactory is situated on the corner of Firet and D etreets.

Guns, Rifles, and Pistols.

Some of the most extraordinary, and I am credihly informed, the most effective weapons, manufactured on this Coast, emanate from the estahlishmont of B. Biglow, 95, D. street, Marysville. Thc celehrated "Kit Carson" carries a seven shooter repeating rifle, made hy Mr B. siuce his residence here. As it may be of eome interest to the eporting, and target shooting readers of the PRESS, I will mention a few kinds of weapcus made hy Mr. B.—together with the prices charged. Common hunting rifle from $25 to $100; target rifles, from $45 to $200; eeven shooter repeating rifles from $100 to $200, after the Billinghurst patent, with rifled cylinder; douhle-barrelled rifle, one above the other, from $65 to $150; ehot gun and rifle comhined, from $50 to $120. He fits new harrels iu Henry rifles, and manufactures a rifle warranted to ehoot through a half-inch of solid iron, carrying 8 grams of powder.

Scirpus Lacustris.

S. D. Baldwin, jeweler, of this place, has lately patented through your office, and claims the right of manufacturing paper and other fabrics from the ahove named suhstance, which is common tule; it grows from 3 to 12 feet high, has an outer fibre, and an inner pulp. The specimens ehown your correspondent, have a staple equal to the best cotton. With the immense acreage of tule in California—should this enterprise prove what is claimed for it, cotton will no longer he "King."

Buckeye Flouring Mill,

At this place, A. D. Starr & Co., proprietors, is run hy a steam engine of 120 horse power; it has 6 run of burrs, a etorage capacity of 1,500 tons, and a capacity of making 250 barrels of flour every 24 hours; 15 men are regularly employed; the machinery used is cog-gearing, and to prevent "backlash," one of Logan's patent Ruhber Backlash Springs is attached to the hurrs; it gives perfect satisfaction at this mill, and they inform me, completely takes off all "backlash."

Business Men.

The principal dealer in stoves, tin, sheet-iron, pumps, copperware, hardware and glassware, is E. L. Rose & Co., No. 66 D strest.

Messre. Bell & Garrett, are the wholesale and retail grocere of this section, and deal in everything appertaining to that line of trade, making it the chief head quarters for farmers for milee around.

Nevada Stage Co.,

Running betwcen Marysville and Nevada, daily (Sundays excepted) is satisfactory to the traveling puhlic; thc distance is 40 miles, fare $5. On the route you pass Timbuctoo, Sucker Flat, Smartsville, Rough and Ready and Grass Valley. Messrs. Chas. Sherman and John Bordwell are proprietors.

L. P. MC.

Our Pacific Coast Islands.

EDITORS PRESS:—In your issue of Dec. 23d you asked for information releting to the islands and other lands on the eouthern coaet of California. I have waited until now in the expectation that some one, better informed on thie eubject, would have given the information desired.

There are Six Islands

South of Point Concoption; three of which, Santa Cruz, Santa Rosa end San Miguel, lying south of and ncar the coast of Santa Barbara county, varying in length from ten to thirty, by an average width of about five miles. Further eouth, on the coaet of Los Angeles county, are Santa Catalina, San Clemente and San Nicoles, about equal in eize to the three above mentioned. All of theee islands are fully etocked with sheep and are, I believe, held by verious parties under Spanish grante. They are all hilly and even mountainous, with little or no land suitable for cultivation. Some of the larger ones have eprings and small streams of fresh water; but moet of them have no fresh water upon them at all; hut all are stocked with sheep, which are not herded, hut permitted to take care of themselves except when they are corralled for the purpose of ehearing or drafting for sale.

It is a singular fact that the eheep do juet as well on the islande dostitnte of water, es upon the others; the fogs and dews eupplying all the moisture they receive. Although the expense of herding is avoided, the sheep become eo wild that a large force ie required to corral and handle them upon the occaeione when it is necessary to do so, and it ie quite prohable that when herded on good pasturee on the main land, the profit is greater; end certainly persons who wish to breed fine eheep and make fine wool, would infinitoly prefer the latter.

On the Main Land,

The quality of our pasturee ie much euperior to that on the islande, and investments there will increase more rapidly in value, as there is always a considerable proportion of the lande on our lerge ranchos euitable for cultivetion, which as the population increases will become valuahle as farming lands. Some large fortunes have already been made in thie way from ranchos purchased originally for sheep ranges; and there are yet many valuahle tracte for sale, at from one to four dollars per acre, varying in eize from five to fifty thousand acres. To give an idea of

The Quality of Our Winter Pastures,

I will state that at the present time the grase on the hills and uplands ie from one to two feet high, and will continue green and growing until May and June, after which it driee into the finest natural hay in the world, and is then far hetter for fattening stock than when green.

There are thousands of acres of valley lands on the Stearns ranchos, near this town, that if eown with alfalfa would enpport ten sheep to the acre, fnrnishing abundance of green feed throughout the year *without irrigation*, ae these lands are underlaid hy an unfailing snpply of water at a depth of from four to eight feet from the eurface, a depth easily reached by all strong rooted plants.

These are the lands upon which the eemi-tropical fruits flonrieh, and although now selling at from $15 to $25 per acre, will in a few yeare become immensely valuahle. Eight inchee of rain has this season completely saturated these lands with moisture. Early eown grain is growing so rank that it has fallen flat upon the ground, and is being mown to allow it to grow up again. With eight inches of rain any other pert of the world would be a desert; ten with us is a full enpply.

Yours truly, WM. R. OLDEN.

Anaheim, Feb. 28, 1872.

Continuation of Veins in Depth.

[Extracts from Warrington Smyth's Lectures.]

It cannot he expected that small strings will penetrate to any great depth, or, as a rule, that small veine will he found largely productive under euch circumstencee. In the olden hooks much was said about what are called "gash veine," which are V-like openings from the eurface, hut which gradually tend to a point where they come to an end. Some of these in the last century were described without due care, as after descending some distance, no thicker than a feather edge, they were found to widen out again, and become wide and important like a reversed A. Some excuee might he urged for the mistake, as explorations cost money, and the veins became eo very attenuated that it wes not wonderful an adverse conclusion should be drawn. Thess, however, are exactly the conditious under which veins have been opened to as great depths of ae from 2,000 to 3,000 feet. For instance the copper lode of the Trasavean mine, is worked through to the solid granite to a depth of 340 fms.; the Samson mine of Andreasherg, is 410 fms. deep. The lodes were never more than 14 or 15 in. in breadth, and eometimes very much less; and yet they were followed to this enormous depth with wondsrful perseverance and success, although one of them is now no longer worked.

A still more remarkahle case is that of the mine of Kongengruh, in Norway, in which a little vein, only two or three inches in thickness, is followed to a depth of 266 fathoms. Facts like these must fill the miner with conetant hope, and that, too, not based on mere theory. Nothing can he a greater fallacy than to eet out on e mining adventure, and finding the vein to be small and poor, to conclude that it is not worth working. On the contrary, a narrow vein may bo found to open out downwards and enlarge for a coneiderahle dietance. Without kuowing the general character of a district, it ie impossihle to eay whether a vein which commencee small is likely to open out; and, therefore, it will all depend on the intrinsic value of the metal sought for whether it will pay for descending through, it may be, very hard rocks to such great depthe.

Somewhat eimilar depthe have heen attained in other countries. In the Hartz, the Clausthal Minee are worked to a depth of 300 fms., on veins of very moderate thicknese, producing eilver ore and argentiferoue galena. In Saxony, the Freiherg Minee afford an interesting example of silver veins, retaining their character and richnees at considerable depthe, many of them now exceeding 230 fathome. At Schemnitz, in Hungary, 220 fms. ie not an uncommon depth; hut, perhaps, the most remarkable deep mine in the world ie that of Przihram, to the weet of Prague.

Veins Variously Affected In Passing Through Different Stratas.

At the end of the last centuiy there was a case in which it wes believed a vein came to a total end, and a great numher of miues have been abandoned in conseqence of a belief that the vien would not widen out, and on eccount of the difficulty of going down to such great depths. The case I have alluded to was that of Llewgyrog, in Montgomeryshire, where, after enormoue expenses had beon incurred, the vein wedged out in the deep. A very singular case occurred eome years since in Scotland. On one of the mountains eouth of the Tay, the late Marquis of Breadalhane discovered a vein of argentiferous lead ore, and a good deal was extracted from it. All at once tho veiu disappeared, and it turned out that the summit of the hill was capped with fluor limestone, and that the veins did not penetrate further, hut when they reached the material helow their ore-bearing character at once ceased. In another case a lode was rich while it was in the greenstone, but heyond that it could only he traced as a film of calcareous epar through a bed of hlack shale, and passing again into a bed of greenstono it resumed its former size and ore-bearing condition.

In the north of England veine are treced through a succeseion of clearly and distinctly stratified bede, while in the west of England and parts of Walss it is difficult to make out their direction under such circumstances. In the north, they have the advantage of seeing what is done when the vein pasces from one hed to another. These hede set downwards regularly, through limestone, shale, and grit or sandstone; and it ie found that when the vein cheeks against the limestone on hoth sides it is likely to be rich, when only on one side not so rich, when in the others it ceasss altogether to yield ore.

These are conclueions which have beeu arrived at all over a large area which has been worked for many years, and that, too, under tho observation of meu of undoubted ability and reputation. It is an exceedingly interesting and inetructive study to follow the phenomena of auy district, and compare them with what is found in other parts of the country. Ae a general rule, in all parts of Europe, when you get a black shale the lode ceases to yield ore iu any quantity, and hecomes not only greatly impoverished, hut pinched as to size. A lode may, in passing from one class of limestone to another, or from one rock to another, lose eome of its ore-bsaring excellence; hut, on the other hand, it is just as likely to improve, whereas in shale it always goes off. Thus, if a veiu comes to a bed of chert, a herd flinty material, it is quite notorious that it will hecome exceedingly rich, and then, when it passes to the shale beneath, exceedingly poor.

Professor Wheatley hae pointed out that in the west of Scotland, veine, while passing through beds of the Lower Silurian Limestone, contain large quantities of lead ore, while in others, eomewhat different in composition and color, they yield none whatever, or next to none. Another case may be cited from the Lake Superior district of the United Statee, famous for its vast masses of native copper. There the veins, when found coursing through hard dolomitic and amygdaloid heds, are richsr in some qualitiss of ore, and poorer in others, than when passing through rocks of a different character.

Lodes on the clay-slate rocks of the west of England are not always easy to follow up, hut their moet productive portions are those which are nearest the contact of this rock with granite. When slatestone is favorahle for roofing and other huilding purpoees, ite motalliferoue character disappeare, and it ie only when comparatively eoft that it seems fitted for the reception of metallic ores.

MINING INVESTMENTS. — The mining *World* (London) in an editorial on mining matters says: Whatever may be said of foreign mining, the *bonafides* of promotere, and the truth of representatione made respecting richness of deposits and estimated yield, the genuine facts of home mining are heyond suspicion. It is imperatively necessary that persons invited to invest in mining adventures thousands of milee away ehould exercise the utmost caution, and neglect no means availahle to ohtain reliable information. Yet to regard all foreign undertakings iudiscriminately, and without enquiry, as hollow and deluaive, is a mietake few iuvestors are likely to commit. The ever-increasing spare capital of this country ie conetantly seeking inveetments of a productive nature, and while mining offers fairer chances of larger profite, it is only natural that it should claim a large ehare of attention.

SEWING MACHINE.—Probahly no one invention hes come into so general use as the sewing machine. The businese of manufacturing and eelliug them has grown up mainly within the past fifteen years, but during the last teu years has increased rapidly. There are now made and sold annually in the United States ahout 750,000 sewing machines, and in every city, town, village and hamlet the useful machines are more or less in uee. Some of the largest manufactories are now running extra houre to keep up with ordere, and even then are frequently unable to eupply the demand.—*Am. Manufacturer.*

THE ship-building trade on the Clyde, near Glasgow, Scotland, during 1871, has heen very proeperous, the total numher of veesels launched having heen 231, with an aggregate meaeurement of 196,200 tons. Among the ahove mentioned vessels were eix war steamers of 10,900 tons; and one hundred and twenty-five screw steamers of 158,000 tons. The sailing vessols were twenty-five of 12,720 tons.

A BILL hae been eent to Congress eetting apart as a public reservation an area of ahout forty miles square, including the Yellowstone lake and cañon, and the famous Geyeer Basin.

Mechanical Progress.

Contact of Belts with Pulleys.

Until a comparatively recent date the practice has been general of pntting the rongh side of a belt to the pnlley and, the suggestion that tho smooth side would give more capacity for transmitting power has heeu received as an innovation of donbtful ntility. Recent experience has shown that, aside from the iucidental circumstance that tho bolt will be less liablo to crack if the grain side is applied to the pulley—the strain heing thus thrown upon the outer or flesh side, which has the greater elasticity—tho difference in tho amount of availahle tension ohtained is so great as to he very distinctly manifest when the two methods aro compared in actnal trial.

The fact has also been dcduced that a leathor belt, with tho dreseed eide to the pulley will eustain one-third more tension without elipping than if the flesh sido is applied. If the helt is required to tranemit the utmost amount of power which can be applied without causing it to slip, this differenoe becomes an important item; and in a certain degreo it will always have its effect upon tho working capacity of the machinery.

Thore has long prevailed in some qnartors an impression that the rough side of the helt will take a firmer hold upon the pulley. Bnt it is not only important that the helt shonld hold snngly to the pnlley while in contact—it ie equally essential that it should he released with perfect ease when it leaves the pulley—there shonld he no impediment to the passing off of the helt. This difficulty has often heen exemplified in attempts to improve the action of the belt by applying adheeive suhstances which canse it to etick to the pulley. The "traction," it is true, is increased hy this means, bnt the stioking of the helt is an obstacle to its free motion, and it is found to have less effective power than hefore.

What is wanted to secure the best resnlts in the nse of helting ie the greatest possihle smoothness both of pnlley and helt, resnlting in the closest attainable contact between their snrfaces; and to this end it is ohviously expedient to put the dressed side of the helt to the pulley. The effect is still fnrther and very greatly improved by covering the pulley with leather, the increase of the resistance to slipping thus ohtained heing stated hy some experimenters as high as fifty per cent.

It is said that a belt will sometimes carry so mnch air with it when in very rapid motion that it actually *rides* the air instead of the pnlley—in other words, that a continuous cnrrent or helt of air is drawn in and interposes itself hetween the pulley and the hand, the latter losing its contact and hecoming entirely detached from the pulley. This is advanced ae the reason why a helt running at high speed requires greater tension to prevent it from slipping than when the speed is less. But the air theory is not a tenable one, except, perhaps, in a very limited sense. The canse of the separation and elipping of the helt on the pulley is nothing else than the centrifngal force of the helt which tends, of conrse, to throw it outward, and requiree to be checked by a corresponding degree of tension.—*Condensed from Leffel's.*

German Prizes for Improvements.—The "Verein zur Befoerderung des Gewerbefleissee" offere several prizes for a durable plaster on brick walls; for a method to determine the valuahle conetitnents in aniline oil; for an opaque red enamel oh gold, eilver, and copper; for a method to make lenses for optical purpoees withont grinding or polishing; for a treatiee on the composition of cements; for treaties on the mannfacture, formation, and constitution of coralline (aurine, pronine, rosalic acid) for the preparation of a eoft yellow solder.—*Dingler's Poly Journal.*

Steel-Headed vs. Steel Rails.—The chief engineer of the Philadelphia and Reading railroad condemns the use of the so-called steel-headed rail, on the ground that the eteel head is found to eeparate from the body—a difficulty not yet overcome by a pecnliar arrangement of the pile in rolling, which had heen intended to obviate it. Of all this class of rails laid on the main track of this railroad since March, 1869, over 25 per cent. have heen removed. The solid steel rails, on the contrary, have uniformly proved satisfactory, showing but little wear, after a service of about four and a half years.

Hooping Boiler Flues.

A practice was introduced in England some ten years since, nndcr the sanction of the Manchester Steam Users' Association for the application of encircling hoops to the furnace tuhes and flues of hoilers originally made withont such hoops. The object is either to admit of their working pressure hoing increased, or to render them safe at the one to which they have been snhjected.

The association after carefully noting the effect and utility of such practico for somo year, at a late meeting issued a circular fully confirming their ntility, and offering some suggestions as to the mode of application, etc., which are so thoronghly practiced that we give the substance of the circular as follows:

Mods of Application.

The greatest caro ehould be taken in their application. The hoope should not he made of flat, but of angle iron. About 3 in. by 3 in., hy ⅛ in. is recommendcd. Thcy ehonld he made in halves so as to be passed in at the man-holes, and riveted to the tuhes or flueo in positiou.

The hoops should he eecnred to the flues hy rivets, but not brought into direct contact with the plates of the flues. A epace of an inch should he left hotween the hoop and flue for the free circulation of water, else the plate will hocome overheated and crack at the rivet holes. Thie ie accomplished by ineerting between the hoop and flue a short piece of tube or ferrule, through which the rivet may pass loosely. Blocks of iron with holes punched in them, forming a clumsy washer, have sometimes been used, but they are objectionable. The ferrules are hest made of these—sixteenth iron cnt end welded. They should be placed about six inches apart, and nicely adjusted so as to give a solid ahutment for the riveting.

The use of these ferrrnles or washers has sometimes been avoided hy constructing the hoope of two pieces of angle iron placed back to back; but they are not found to work well. The opposite helves of the hoop shonld he carefully welded and drawn together and connected hy hutt-strips, riveted to their ends on the backs; much depends on the hoops heing made one with the flue. They should not be allowed to touch the shell of the hoiler, or the flnes may hecome etrained and leekage be induced—ae the furnace tuhes rise and fall with the varietione of the temperature, and thus grind against the eides of the hoiler or one another, if allowed to como in contact. Where space requires it, a portion of the flange of the angle iron may he cut off to prevent contect. It is recommended that in every hoiler of ordinary dimensions at least one hoop should be placed upon the flue about five feet from the front, to guard the flue against strain from the action of the fire. If two are used, the second should he placed a little heyond the middle from the front. With inoreasing numbers always bear in mind that the amount of strain decreases as you approach the rear of the hoiler.

In cleansing out the boilers the annular spacos bctween the hoops and flues ehould always he carefully attended to.

Conveying Power over Telegraph Poles. The large establishment of James Richmond, at Lockport, N. Y., the well known maker of grain cleaners, is driven hy water power from the waste of the Erie canal. Mr. R. also supplies a considerahle amonnt of power to other establishments, some of which are over half a mile from his water wheels. This he does by means of endless wire cables, *carried on telegraph poles*, to neighboring factories and mills. A very simple arrangement of coge enahles any numher of endles wire cahles to run to central points in the city, and thence in all directions. In this way, the printing presses of the *Journal*, the *Times*, and the *Union* are run at a small cost per annum. Mr. Richmond also furnishes power to a whip factory, a cahinet shop, a glass factory, 2,500 feet away, a ehirt factory, 2,000 feet in the opposite direction, a foundry, and a machine shop. He has some valuahle patents in connection with this distrihution of power, and has lately fitted up a serios of distributing wires at Fulton, in Oswego county.

The Danks Furnace.—Much interest continues to he felt in the euccess of this invention on hoth sides of the Atlantic. The Cleveland people are very much excited over it; and if the reported enccess is maintained, it will soon do away with all ordinary puddling furnaces in that vicinity. It hids fair to rival in importance even the Bessemer steel process.

Scientific Progress.

Do Plants Derive Their Carbon From the Earth?

This is a question of as much practical value to the agriculturist as of scientific interest to the student of Nature; and Messrs. Laws & Gilhert, the eminent agricultural experimentalists of England have quite satisfactorily solved the question in the negative. They have discovered that, taking the averago of seventeen years, the gross amount of produce removed from one acre of continuously nnmanured laud, in the case of wheat, was 2,434 lbs., and that when from this gross produce they suhtracted the amount of water it coutained, and of ash which it yielded, there remained 1,963 lbs. of dry organic matter; and when they came to analyse these 1,963 lbs. of dry organic matter, they found them to contaiu 880 lbe. of carbon. And this, it ehould he horne in mind, ie the average produce of seventeen years' continuous growth of wheat on land to which nothing whatever was added.

Now to a similar etrip of land the same experimentalist added every year a certain quanty of mineral matter, corresponding to the ashes yielded hy each euccessive crop removed; and on the etrip so treated, the amount of gross produce was found to be increased from 2,434 lbe. to 2,912 lbs. the amonnt of dry organic matter to he increased from 1,963 lbs. to 2,347 lbs., and the amonht of carbon to he increased from 884 lbe. to 1,052 lbs.

To another slip of land they added year hy year exactly the same quantity of mineral matter, and in addition a considerahle quantity of ammonia salts—the ammonia ealts end mineral matter heing alike ahsolutely free from carhonaceone orgenic metter. And in the case of this strip, they found that the amount of gross produce was increesed to the surprising extent of 6,394 lbs., while the amount of dry organic matter was increased to 5,149 lbs., and the amount of carhon to 2,308 lbs.

These results are fully ae high—in most cases, indeed, somewhat higher—than are results ohtained on a fonrth strip of land, eupplied year by year with an abundance of ferm-yerd manure, containing not only the mineral matter, and ammonia added to the third strip, hut rich also in carbonaceous organic matter.

Professor Odling says it is inconceivable, then, that the plant should acquire ite carhon from these organic mattere of the soil, seeing that the amount of carhon in the crop may he increased twofold, and in some casee nearly threefold, hy adding to the eoil suhstances, such as mineral selts and ammonia, which are entirely free from orgenic metter. Is is inconceivable, too, that the originel humus in the soil could furnish the carbon contained in a succession of crops for seventeen years consecutively.

Rupture of Iron Wire by a Blow.—As the result of a series of investigations upon the rupture of iron wire by a hlow, Mr. John Hopkiuson comes to the following oonclusions:

1. That if any physical cause increase the tenacity of wire, hut increase the product of its elasticity and linear density in a more than duplicate ratio, it will render it more liahle to break under a blow.

2. That the fracture of a wire depends on its length, its support, and the method of applying the hlow.

3. That in cases such as surges on chains, etc., the effect depends more on the velocity than on the momentum or *vis viva* of the surge.

Sulphide of Bismuth.—Bismuth in the prosence of or in comhination with sulphur, yields a beautiful red coating, when passed before the blowpipe on a large piece of charcoal, up the addition of a little pulverized iodide of potassium. A finely pulverized mixture of equal parts of eulphur and iodide of potassium is best kept for euch purpose and makes an excellent test material for bismuth. In making these investigations, V. Kohell met a green mineral whioh occure associated with joseite at St. José di Madureira, Brazil, and which proved to be biemuthite, not previously noticed at that locality.

Printing on Glass.—Type made of an elastic material is used, and printing ink, with which is mixed fluoride of calcium. The glass thus printed on is then heated, to a suitable temperature with eulphuric acid, and, having heen washed with water, it exhibits in indelible engraving the figures of the type.

On the Melting and Regelation of Ice.

Professor Bottomley, of Glasgow Univorsity, descrihes in *Nature*, some onrions experiments of his on the apparent plasticity of ice. In a recent leotnre to his class, he placed a lump of ice as large as an apple on a piece of wire gauze, and on this a hoard, weighted with 12 pounds. Before tho conclusion of the lecture, a considerahle quantity of ice was found on the lower side of the gauze, firmly united to that ahove, though apparently forced through the meshes, in a room at 15° C. In a second experiment he placed a block of ice on two parallel boards near together, passed a loop of wire over the ice and hung weights on the ends. Various sizes of wire were tried, and in the final experiment, a wire 0.1 inch in diameter was used, weighted with 56 pounds. It passed entirely through the hlock of ice, and fell upon the floor; but this block of ice, though the plane of passage wae clearly marked, wae not divided, nor could it he split in thie plane with a knife and chisel.

This remarkahle result he explains to he a consequence of Jamee Thomson's theory of regelation, as follows: The etrese npon the ice, due to the pressure of the wire, givee it a tendency to melt at the point in contact with this wire, and the ice, in the form of water intermixed with fragmente and new crystals, moves so as to relieve itself of pressure. As soon as any portion of the mass is thns relieved, freezing takee place throughout it, because its temperature is redneed helow that of the freezing point of water at ordinary pressures, hy melting of contiguous parts. The obvious tendency of the ice under the pressure from ahove is thue hy a seriee of meltinge and refreezings to allow the paeeage of the wire and yet remain a solid hlock.

Temperature of the Sun.—Various theories have heen adduced to determine the temperature of the sun. Zöllner has recently suggested the following:—"Starting from the fact of the eruptive nature of a certain class of eolar protuherances, thinks that the extraordinary rapidity with which these red flemes ehoot forth proves that the hydrogen of which they are mainly composed must have hurst out from under great pressure; end if so, the hydrogen must have been confined by a zone or layer of liquid from which it hreaks loose. Assuming the existence of such a layer of incandescent liquid, thon applying to the prohlem the principles and methods of the mechanical theory of gases, he arrives at the conclusion thet the difference of pressure needed to produce an explosion capable of projecting a promiuence to the hight not unfrequently noticed, is 4,070,000 atmospheres. This enormous pressure is attained at a depth of 130 geographical miles under the eun'e surfece. In order to produce this gigantic pressure the difference in temperature hetween the inclosed hydrogen and thet existing in the solar atmosphere amounts to 74,910° C. In a similar way Zöllner calculetes the approximate ahsolute temperatnre of the eun'e atmosphere, to he 27,700° C. —a tempereture about eight times as high as that given hy Bunsen for the oxyhydrogen flame, and one at which iron must exist in a permanently gaseoue form."

Manufacture of Brandy from Sawdust.—Some years ago Braconnat discovered that grape sugar could he ohtained hy hoiling cellulose with dilute acids, but Professor S. Steuherg was the first to introduce the manufacture of braudy on a practical scale in this way. In February last C. G. Zetterland, of Hulda, made several experiments in preparing brandy from the sawdust of fir and pine. We condense his description in the *Arbeitgeber:* Nine cwt. sawdust (holding considerahle water) were boiled with 0.6 cwt. hydrochloric acid (ep. gr. 1.18) and 30.7 cwt. water. After 8¼ hours the mass held 3¼ per ct. grape sugar and after 11 hours 4.38 per ct. A larger percentage than the latter was not obtainahle. The acid in the mass was neutralized with lime, the mash cooled to a temperature of 30°, and the yeast from 20 lbs. malt was added. The fermentation was finished in 96 hours. After distilling there were obtained abont 15½ gals. (English) of hrandy of 50 per ct. at 15°, free from any smell or taste of turpentine and of good flavor. The experimenter thinks it probahle that the manufacture of hrandy can he carried on snccessfully on a large scale after experiments have ehown the proper method of the details. As air-dried saw dust contains about 80 to 85 per ct. cellulose, if it were possihle to traneform all this cullulose into grape sugar, each cwt. of air-dried sawdust would yield at least 7 gals. of 50 per ct. hrandy.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE COUNTY.

GLOBE.—Monitor *Miner*, March 2: During Feh. a little over 60 ft. of main tunnel was made hy 3 men. An assay of the gray copper ore from the bottom of the shaft gave 33 8-10 per cent. copper and $1.25 silver per ton.

WHITE'S furnace at the Tarshish mill is nearly ready for work. The mill will he ready to get np steam next week.

AMADOR COUNTY.

SPEOIMEN.—Amador *Ledger*, March 9: A piece of quartz rock from the shaft of the State of Maine mine, left at our office a few dsys ago, literally sparkles with fine gold, and is well charged with sulphurets.

GOLD BRICK.—We have heen shown a gold hrick weighing 389 ozs., the proceeds of 16 days run on rock from Kennedy mine in a 20-stamp mill. As work progresses the rock in the mine hecomes richer in free gold and snlphurets. That heing taken out will average $25 per ton hy ordinary mill process.

VOLOANO. — Cor. Amador *Dispatch*, March 9: The Markley mine pays from $80 to $100 per ton.

Another lead has heen fonnd 2 miles from it, known as the Rodgers Lead, that hids fair to he equally as good. At present it is not heing worked on account of the weather. The placer mines are paying well. The Robinson claim, near Foster's, is doing "hully" It pays from $5 to $8 to the hand per day. Still higher up, on the same range, have been found diggings that are paying well—among them are some near Tarr's mill.

BUTTE COUNTY.

FOUR-IN-HAND.—Chico *Review*, March 8: This is the name of the newly-discovered claim and district located 25 miles from Chico.

CALAVERAS COUNTY.

CALAVERAS HYDRAULIO M. Co.—Calaveras *Chronicle*, March 9: The Co. will soon be in readiness to commence operations in their mine near Worth's Hill, 1,900 ft. of iron pipe are to he used in conducting water for hydraulic purposes, 1,400 ft. of which are completed.

HUDSON.—Three shifts of men are employed in sinking the main shaft, which is 60 ft. deep showing a 9 ft. ledge. A whim, whim-house, hlacksmith shop and other hnildings have recently heen erected, and every preparation made for workiog the mine in good shape.

GWIN.—The mill on the lower Gwin mine—36 stamps—is kept constantly running, the ore crushed, however, not being fist-class. The shaft in the npper mine is cleaned out down to the water, hut it will he some time yet hefore rock can be taken out. The sinking of a new shaft between the two mines has been commenced.

SAN ANDREAS.—Cor. same: The Sciffard ledge is 8 ft. in width, but ahout 2 ft. on the hanging wall is allowed to remain. They are sinking a shaft on the ledge.

The Garnet mine is heing operated and continues to "give out" in the good old way.

EL DORADO COUNTY.

CLARKEVILLE.—Cor. Placerville *Republican*, March 1: There is considerable prospecting going on, and we have 2 hydraulio Co's. driving away near Screech Owl Ravine.

INYO COUNTY.

COMMENCED OPERATIONS.—Inyo *Independent*, March 2: Jimmy Sharpe and Clastine have gone to work on the Blue Bell ledge, in the Inyo range, opposite this place, to take out ore for shipment.

LOS ANGELES COUNTY.

SHIPMENT.—Los Angeles *News*, March 2: The Orizaba will take to-day the largest shipment of hullion that has ever heen made from this place to S. F. It consists of over 3,000 hars.

MINING.—The Pah Ute Co. in Clark dis. own 75 ledges from some of which very rich rock is heing taken, the ore yielding aa high aa $800 a ton.

SAN GABRIEL RIVER.—Mining on the San Gabriel river is progressing favorably. The Roberts-Matfield Co. have completed their first cleaning up, with a satisfactory resnlt. The San Gabriel Co. have let out a contract for the completion of their ditch, for $10,000. One mile of the ditch has been constructed, and there remains 3 yet to be done.

MARIPOSA COUNTY.

HORNITOS.—Mariposa *Gazette*, March 1: Rumor has it that Spanish Tom & Co. have taken out $20,000 during the past week. One pocket after another is found, varying from $3,000 to $8,000. I have heard of several strikes heing made in this vicinity lately. Men and boys can he seen in every direction with pick and pan searching for the hidden treasure. Jack Moseman took out $400 from a pocket in his claim, one day last week, and has more of the precious metal in sight.

NAPA COUNTY.

QUICKSILVER.—Vallejo *Chronicle*, March 2: The Whitton Co., on the divide hetween Santa Rosa and Napa valley, have run a tunnel into the mountain ahout 250 ft., with a depth from the surface of 150 or 200 ft , and have a hody of ore diffused throngh the rock which will assay from 25 to 90 per cent. The Oakville Co. is lower down on the mountain, and has heen working 40 or 50 men. Geo. Cornwell & Co. have run a prospecting tunnel with splendid indications, and propose to run a main tunnel 300 ft. helow the summit.

NEVADA COUNTY.

SLIOO QUARTZ LEDGE.—Nevada *Transcript*, March 9: Lord & Co. have heen at work a short time taking out eurface rock, and they have a splendid prospect.

BUCHANAN MINE.—The mine, ahove this city, is turning out some splendid rock. There is a streak of yellowish quartz running through the ledge, which shows free gold in large quantities.

RED JACKET.—The Red Jacket Co., near the Anthony House, have struck some splendid looking gravel. The Co. has heen engaged in running a tunnel for ahout 5 years and during the entire progress the gravel has improved. An English Co. have been examining it and it is thought they will purchase the ground.

REDAN MINE.—Stiles & Co. have commenced the erection of a quartz mill on Little Greenhorn creek, for crushing rock from the Redan mine. The rock prospects well, and the ledge is large and well defined.

NORTH STAR. — Grass Valley *Union*, March 8: The mine has shipped for the 4 weeks, ending yesterday, gold to the value of $19,000. The shipment yesterday was 900 ozs.

PLACER COUNTY.

DUTCH FLAT.—Cor. Auhurn *Herald*, Msrch 9: The Dutch Flat Blue Gravei M. Co. is on the north side of this town. Its claims consist of 20 acres. Some of the surface has been washed away, and the present Co. is trying to wash the hlue gravel to the hedrock. The ground is pretty hard.

The Self Rising Co., on Grass Hill, had a good clean up.

The Plug-Ugly Co. cleaned up ahout $500, the result of 6 days' work. This Co. is washing night and day.

The Backer Co. had a dividend of $1,000. The ground is rich, but very hard.

PLUMAS COUNTY.

QUINCY *National*, March 2: The Black Hawk Co. recently cleaned up some $1.200, the result of 2 months' run of top dirt.

LA PORTE.—Cor. same: The contractors in the Bordwell tunnel are going ahead finely, making from 6 to 8 ft. per day.

MEADOW VALLEY,—Cor. Oroville *Record*, March 9: The claim of Rohert Grace, on Spanish Creek, at Green Flat, is being worked advantageously, with a full set of men. Nelson & Hanson are progressing finely, on adjoining ground. At Red Hill, Folsom & Messer are preparing for a spring gang. Morris Smith, on Badger Hill, is working with good success. Andrews & Kennedy have almost completed their exsive tunnel at Devil's Elhow.

SAN DIEGO COUNTY.

BULLION.—San Diego *Union*, Feh. 29: The shipment of bullion to S. F. yesterday amounted to $3,750—all from the San Diego mines.

SAN DIEGO MINES.—Affsirs are in a very encouraging condition. All the mills are busy at work and the development of the different mines is going on vigorously. The Redman Mill has just cleaned up after running upon a lot of ore from the Golden Chariot lead which yielded handsomely. It is now engaged upon rock from the Ready Relief. The mills of De Frees & Co., and Gunn, Reynolds & Co., are both crushing rock from the Owens lead. The Stonewall Jackson and Antelope Mills are both running upon ore from their own leads. The new mill of Wilson & Co. started up a few days since and is husy crushing ore from the Helvetia.

SIERRA COUNTY.

KANAKA.—Mountain *Messenger*, March 2: Otto Rey & Co. are working the Kanaka. They are putting up chlorination works.

TRINITY COUNTY.

LEWISTON.—Cor. Trinity *Journal*, March 2: Bolt's Hill is fast going away. Olney Phillip's claim is fast losing its breadth of ground. There are several men employed in it. Mat Trask and Squire Ross have washed off the side of one large mountain, and in doing so struck a channel which prospects finely. All the rest of the miners are doing well.

Nevada.

ELKO COUNTY.

COPE.—Elko *Independent*, March 9: The hullion shipment for Feh. was $22,041. A prosperous seasou is anticipated.

EUREKA DISTRICT.

ANTELOPE DIST.—Eureka *Sentinel*, March 5: The mines are looking well and the prospects are excellent for an important camp at an early day. Donald McMurchy, in company with the two McIntyre boys, have a fine mine with 50 or 60 tons of ore on the dump, which will prohably mill $60 per ton.

PHŒNIX Co.—This Co. have shut down their furnaces for the purpose of making many needed improvements. The Redmond Co. have also shnt down for repairs.

SHIPPED.—Supt. Mowry, of the Lemon Mill, informs us that one of the furnaces of the White pattern has heen shipped from S. F., and will arrive here within 2 weeks from now.

ELY DISTRICT.

BULLION.—Ely *Record*, March 3: W. F. & Co. shipped since the 29th ult., bullion valued at $84,425.05.

RED CLOUD.—The shaft is down 75 ft. At about 60 ft. down a small strata of very rich yellow cloride ore was struck, which has continued down to the present depth, showing that the real ledge has been struck. The rich streak of pay ore is about 1 ft. wide.

VULTURE.—The shaft is 12 ft. deep. The ledge is nearly perpendicular with a slight pitoh to the north, and the walls of solid quartzite. The ore in the bottom of the shaft is fully 5 ft. wide.

PIOCHE.—At the 400-ft. level good ore has been struck.

WARD BEECHER.—The incline is down 185 ft. and the ledge is beginning to show signs of improvement.

BOWERY MILL.—Gen. Page is rushing work on the mill with a full force of men, and hy the 10th of March it will be started on ore from the Bowery mine. The mine is looking well, a fine hody of ore has heen struck in the esst drift, and the ledge shows well in the same shaft. At the depth of 100 ft. the shaft cnt a rich body of ore.

PEAVINE.—Mr. Cavallier has started men to work sinking the shaft deeper, and also to grade off a placo for a shaft house. The ore on the dump is heautiful and rich, the ledge shows in the shaft from the surface down, the walls are perfect.

PAOE AND PANACA.—There is a full force engaged in timbering the works. The machinery is all ready to put up, and the hoisting works will be ready as soon as the timhering is completed.

HAHN & HUNT.—The mine is looking very well, and the character and extent of the ore is improving.

RAYMOND AND ELY is as good as ever, and the ore continues everwhere. The ledge is extensive, solid, and rich in free milling ore.

INOOMAR.—The hoisting works are nearly completed, and the whistle will blow at noon to-day. Ledge looking well.

HAVANA.—At 40 ft. the ledge is growing softer, and wider. All the indications are good.

ALPS continnes to improve. The east and west drifts are still in good ore, and everything looks well.

MEADOW VALLEY.—A fine hody of ore has heen struck in No. 3. From the 17th to the 19th ult., their shipments aggregated $55,343.

CHIEF DIST.—This Dist. is some 20 miles south of Pioche. Samples of very fine ore have heen shown to us from some of the mines just opened there. Parties interested speak very highly of the prospects of the Dist.

HUMBOLDT.

BULLION.—Unionville *Silver State*, March 9: Amount shipped from the Arizona mine, since our last issue, was $5,986.

SACRAMENTO DIST.—Encouraging reports reach ns. The Silver Queen ledge promises to be a valuable mine. At a depth of 120 ft., ore of the richest quality is developed. The ledge is 14 inches wide.

PIONEER AND INSKIP Co.—The Co. contemplate the erection of a chlorination furnace of the Stetefeldt pattern, near the Pioneer mill this spring.

UTICA MILL, at the outlet of Humholdt Lake, will start up ahortly on ore from the Almaden mine, Desert Dist.

GALENA.—Cor. same: The Battle Mt. mine is within ¼ mile of Galena. A tnnnel has heen run ahout 200 ft. and the ledge tapped 100 ft. helow the surface. There is a large body of mineral in sight. The Trenton mine, 7 miles west of here, has heen honded to an English Co. for $100,000.

REESE RIVER.

BULLION.—Reese River *Reveille*, March 7: W. F. & Co. shipped from this city during Feh., 57 hars, 4,408 lbs, valued at $39,288.40. All from the Stetefeldt mill of Belmont, Ellsworth mill of Mammoth, and the Metcom mill of this dist.

RICH.—A specimen from the "Lida Belle" ledge at Lida valley, hrought in assayed $12,592.24, and one from the Brown Henry assayed $12,661.37.

WASHOE.

CHOLLAR-POTOSI.—Virginia *Enterprise*, March 7: The Co. are again taking out ore. They are extracting 100 tons per dsy from the Piute and Blue Wing stations. A large amount of prospecting is heing done in the mine, chiefly at the first and second stations of the new shaft and in the South Belvidere and Piute sections.

SILVER BARS.—We yesterday observed on the counter of the Bank of Cal. silver hars to the value of $37,000 from the Crown Point, Belcher and Savage mines.

ARIZONA.—The Arizona Co., American Flat, have opened out their old tnnnel and are working npward from it to prospect their ground.

SUTRO TUNNEL.—The tunnel was yesterday in 2,764 ft.; the ground is hard and no water is coming in at the face.

SAVAOE.—The ore hody recently developed at the lowest level, althongh not of a high grade, is reported to he over 30 ft. wide.

THE Sierra Nevada mine is looking well, hut as yet, outsiders are not allowed to examine the new development.

AUBURN MILLS.—Reno *Journal*, March 9: The Auburn mills are running to their full capacity on rock from the Co's. mine at Rye Patch. Their ore yields well and the mine looks hetter than ever hefore.

WHITE PINE.

BULLION.—White Pine *News*, March 9: W. F. & Co. shipped to-day, to London, for Eherhardt & Aurora M. Co. 2 bars, 166 lbs., valued at $3,113.54.

ST. GEORGE—Situated 400 ft. south of the main Eherhardt shaft, is taking out from 20 to 25 tons of average-grade ore per day, and working 12 men.

YOUNO CHIEF.—An increased force has been placed in the southwest chamher. Taking out 5 tons per day of mediumgrade ore. Miue looking well, and masses of ore in sight.

FROZEN ZONE.—A new location shows a mass of high-grade ore a number of tons of which will be tested this week.

SILVER PLATE.—Looking well and widening. Working 24 men. Seventy tons of ore worked from this mine yielded $75 to the ton.

THE "Truckee," "Caspian," and "Mammoth" are working with uniform results. An average of 5 tons per day are extracted from each of these locations. Working 4 men each.

GEN. LEE.—Drift from the main ore chamher is in 20 ft. on the spar seam, and opened in a lsrge body of ore, varying in assay value from $50 to $500 per ton. Drift will be followed to prove the extent of this extensive ore hed recently found.

EAST SHEBOYOAN.—Same number of men employed, principally prospecting. Indications are favorable of meeting the ledge of ore running at right angles from the original tunnel.

NORTH AURORA.—The body of ore has improved since last week.

SAN JUAN DEL RIO.—The mine is improving as depth is gained.

SILVER WAVE.—Perkins shaft down 105 feet.

Arizona.

MINES AND MINING.—Prescott *Union*, Feb. 24: They have "struck it" richer than ever in the Tiger. It is now open to a depth of 180 ft., by shafts, besides hy cuts and tunnels. The ore will be shipped to S. F. and perhaps to Europe, for treatment.

Beantiful coils and threads of native silver, heavy black snlphurets and ruhy ore constitute the product of the mine. The drift is in one lode 160 ft.; shaft down about 122 ft.

The Lorenna, 'Benton, and other lodes near the Tiger are not far behind it in richness.

In Pine Grove Dist., the Del Pasco is yielding plenty of rich free gold rock. T W. Brooks started over a day or two ago, with 5 or 6 men, to work at mine and mill.

On Lynx creek, there are between 50 and 60 placer miners.

Parties of men are at work in Black Cañon creek, with results as yet unknown to us. In Walnut Grove Dist., J. White and others are erecting a furnace and taking out ore. In Wickenburg Dist., the Vulture mill is pounding away.

THE VULTURE.—The manager reports as follows: "We are working a length of ground about 300 ft. and have sunk 320 ft. In this length of about 300 ft. and to a depth of 250 ft., the mine has been well opened and in this area, are millions of tons of ore.

WALLAPI DIST.—Cor. same. The Lone Star Co. has been furnishing rock for 2 weeks. Last Sunday I was shown a quantity of bullion amounting to over $2,000, the result of a 50-hour run of Hardy and Meachman's 5-stamp mill, upon Lone Star ore. A drift is being run from the bottom of the shaft, eastorly, and the ore taken out is richer than herotofore. Mr. Hardy left here yesterday with the intention of making arrangements for the erection of smelting furnaces.

Considerable interest was awakened here by a rich strike in the Keystone. Yesterday as the prospect was gloomiest, one of the workmen came down street, bunting the owners, and exhibiting specimens of ruby and horn silver, which they had struck in the bottom of the shaft. The value of the rock was $4,838 per ton. A vein of this ore, about 7 inches in thickness and running along the hanging wall was soon discovered. It widens out gradually as it goes down. The Keystone shows very fine carbonate ore on surface, and in the shaft exhibits sulphurets.

The rock being taken from the Fairfield looks better than usual.

The Alama is a new ledge, just opened. It is free carbonate ore, and assays a little over $100 per ton.

The preparations for Mr. Coover's furnaces, at Chloride Flat, have been commenced, and work is being pushed right along.

PINAL MOUNTAINS —San Diego *Union*, Feb. 29: A gentleman just arrived, brings specimens of silver which he intends to have assayed in S. F. The discovery of this ore caused considerable excitement some 3 months since. The discoverers of the Silver Queen, have been working steadily on their claim ever since.

CHANGE.—A change will shortly take place in the proprietorship of the Vultnre mine, by which it will pass into the hands of an English Co. Preparations are being made to lay a railroad track to the mill.

Colorado.

ITEMS.—Colorado *Miner*, Feb. 29: C. H. Utter is shipping on account of owners, large quantities of smelting ore to Black Hawk. Baily & Nott shipped during Feb., 80 tons on account of owners, of more than ordinary rich smelting ore. Campbell & Clark during Feb. have shipped on account of owners, 40 tons of very rich smelting ore. Since our last report Palmer & Nichols have shipped 2 silver bars, valued at $2,684.48. A good body of ore has been struck in the Cashier, east from the discovery.

OUR MINES.—Csrihou *Post*, March 2: In the Caribou mine there is a steady improvement, the vein having widened to over 6 ft.

The Carihon mill, is running steadily and successfully.

The Potosi is producing a good articlo of silver ore in considerable quantities.

The Trojan has been in operation during the winter, and furnished the stamp-mill of Hetzer & Hines with plenty of ore. The Boulder Co., Mt. Vernon, Wabash, and several other lodes, are being worked with more or less activity.

LEAVITT.—Central *Register*, Feh. 28: The product of the stamp mill ore from the claim on the Leavitt lode, leased from Bela S. Buell by Mr. Mellor, for the first fifteen days of this month, was 740 ozs. of gold, worth about $18 per oz., aggregating $13,320. There is little doubt that the lessee will raise, during the last 2 months of this lease, stamp mill ore to the value of $50,000.

A good report comes from the Victor lode in Idaho Dist. on the divide between Virgina Cañon and Gilson Gulch. Eight tons of ore have been hauled to the B. and C. smelting works, which assayed 119 ozs. of silver per ton.

The purchasers of the Stalker & Standley property, on the California lode, in Nevada, are raising some very fine ore. Work on the Bobtail tunnel is being energetically advanced. Work is to be resumed immediately upon the Cons. Gregory, the Bobtail and Fisk properties, which have been non-productive for a year past, owing to water in the shafts.

Idaho.

PAYETTE MINES.—Idaho *Statesman*, Mar. 4: B. S. Warrinsr is mining in the hills south of the Payette river, about 6 miles below Horseshoe Bend. He came over here the other day with his first clean-up for the season, 62 82-100 onnces gold dust with $19.37 per ounce.

GOLDEN CHARIOT. — Silver City *Avalanche*, March 2: Supt. Pheby has commenced sinking a winzo in the 8th lovel, opposite the shaft, where he finds a fine looking vein of ore. The Owyhee mill has been shut down this week, but will start up again in a day or two. Fine looking ore continues to come from Knott's mine on Florida Mt., and is being worked at the Cosmos mill.

Lower California.

SAN RAFAEL.—San Diego *Union*, Feb. 18: Since the erection of McKoan's quartz mill about 1,500 tons of low grade ore have been crushed. This ore averaged about $13 per ton.

Montana.

TEN-MILE LODES.—Helena *Gazette*, Feb. 26: Among the argentiferous galena lodes on Ten Mile, is the Mitchagomma, near the month of Beaver Creek. The vein is well defined, about 7 ft. wide, and filled with mineral in veins and masses, mixed with a white earthy matter. Five tons per day can easily he taken out of the upper tunnel, and it is expected that this can be increased to 10 tons as soon as the lower tunnel taps the vein. Below the Mitchagomma, Symes & Corbin are working the Corbin lode, while about 1,000 ft. up the creek, the famous Lee Mt. lode is situated. About 6 miles still further up, the Travis Boys are working a very rich argentiferous galena lode.

REDUCTION WORKS. — One furnace is running and producing base bullion at a rate of something over 100 pounds an hour. Preparations are being made to put a second furnace in blast.

ARGENTA. — Bohm's Reduction Works are running and smelting with excellent results. There a number of persons engaged in taking out ore here at present. Harry Griffith recently discovered a 3 ft. vein of carbonate of lead. Longhridge & Barber have struck a good body of ore on the Queen ledge. Bray & Wing are preparing to take ont ore from the Legal Tender lode. C. Fletcher & Co. are rolling ore from the "Dictator." The "Ferdinand," Bohm & Co.'s lode, looks well. The recent news with regard to the mines from Bannack, Blue wing, and Vipond's, is very gratifying.

BEAVERHEAD Co.—Cor. same: The smelting works here (argenta) run steadily and smoothly. There are a few men engaged on the lodes, about Argenta, and a good many in the Blue Wing dist. and most of them are doing well. The Huron shows a fine vein of very rich ore. There will he at least 1,000 tons of rich ore on the dumps in Blue Wing dist. by Spring.

Utah.

BULLION.—S. L. *Tribune*, March 8: W. F. & Co. received from the 28th ult. to the 8th inst., from the Meadow Valley works 41 hars, valued at $53,817.18, and from Raymond & Ely 36 hars, valned at $59,-682 15.

SHIPMENTS.—The Emma mine Co. has shipped 34 car loads of ore within the last week for Liverpool. They still have on hand ready for the cars 1,000 tons in sacks. About 30 tons being raised daily.

EAST CANON.—G. M. Gerrish has charge of the Old Ophir Smelting Works, and has already made a successful run. The furnace will start again in a few days, when it is expected to rnn right along.

The Pioneer mill will start to-day. A Mr. Fawcett is preparing to start—by water—a 5 stamp mill and 2 furnaces for an Eastern Co. The English Co. have a furnace about ready to run. Mr. Aikin's furnace is completed and thoroughly dried, awaiting the pulp from the hatteries.

The Jupiter is on Chloride Hill, about a quarter of a mile from town. The arastra has been reduoing about ½ a ton per day but it has the capacity of reducing 5 tons.

The Peck arastra made a start this morning. Messrs. Thompson and Blair are building one about 2 miles above town. It is anticipatad that all the reduction works will start up very soon, including all the smelters.

EMMA.—A shaft has been sunk 70 ft. below all levels, and the same body or vein of ore continues with a moderate increase in value. It is estimated that there is ore enough in sight to pay 18 per cent. on the value of the mine ($5,000,000.

S. F. Stock Exchange Board.

SAN FRANCISCO, March 14, 1872.

Stocks have been active during the week, and prices have been generally firm for most kinds. The North Star mine shipped during the month to this city $17,500. The sales at the Board for the week ending on the 6th inst., amounted to $3,867,600. The last weekly report of the Chollar-Potosi shows 700 tons of ore extracted, assaying $42,37 per ton. The special meeting of the Halo & Norcross Co.. on the 18th of April, is to take into consideration the subject of increasing the capital stock from $1,600,000 to $3,200,000, making 16,000 instead of 8,000 shares as at present.

The *Stock Report* of Tuesday, says that the last weekly report of the Crown Point mine shows 1,700 tons of ore extracted, valued at $76,635; Hale & Norcross, 1,000 tons ore; Savage, 1,200 tons ore, assaying $32.05 per ton; on the 9th, $32,000 were sent from Raymond and Ely from Meadow Valley mine, $26,600, received on March account; ore shipments increasing at the Belcher.

At the annual meeting of the Hale & Norcross Co., held on the 13th inst., the following Trustees were re-elected: J. C. Flood (Pres.); W. S. Obrien, C. O'Connor, J. W. Mackay, John Harrold, W. O. Hoff, and Jas. French, J. F. Lightner is still Secretary, and J. G. Fair, Supt. The Secretary's report gives the total receipts at $1,118,328 of which $862,702 was from hullion. The disbursements were $1,181,328, of which $80,000 were paid to stockholders as dividends.

Comparative Prices—Extremes, Advance and Decline.—S. F. Stock and Ex. Board.

IRON SHIPS.—A large iron ship-building yard has been fitted up at Wyandotte on the Detroit river and a steamer is in course of construction. All the necessary appliances for this kind of work have been added to the Wyandotte Iron Works.

THE OPEN SEA navigated in 1871 below the 78th parallel by the Austrian Expedition is more than 500 miles in extent longitudinally and of indefinite breadth.

DIAMOND DISTRICT.—A correspondent of onrs in Diamond City, Confederate Gnlch, one of Montana's richest placer oamps, says that everything is flourishing there and everybody bnsy. The district is situated about 38 miles east of Helena. Rankin's claim has a shaft 60 feet deep with a douhle whim over it. The pay streak is 100 feet wide. The claim is well timbered and capped and looks as if it might stand for ages. It has been well drained at a great expense and is psrfectly dry. The work shows that the coin is there however. There are 20 men employed. Magill & Co. are doing well. Further down the gulch is King and Gillet's flume, whioh is 4,000 feet long, 4 feet wide and 30 inches deep, with a grade suffioient to oarry houlders as hig as a horse. The guloh is 7 miles long and all of it being worked with good pay. The depth to the hedrock is ahout 33 feet.

A STRIKE.—The Gold Hill *News* of the 6th inst. says that the famons mule which has heen hauling the oars on the 1,100-foot level of the Belcher and Crown Point mines all winter has had to be hauled out. It got so lazy and obstinate that it refused to work—made a strike, as it were, all hy herself. Another mule has heen sent down to fill her place. Kellogg, the foreman has named this new mule "Susan B. Anthony."

The Hunt & Douglas Process for the Extraction of Copper from its Ores.

No. 4.

[Concluded.]

Peroxyd of Iron.—The precipitated hydrated peroxyd of iron, holding more or less oxychlorid and basic persulphate, is in part retained hy the gangue, hut the greater portion of it accumulates in the settling-tank. When suspended in water and heated with an excess of sulphurous acid gas, it is converted into a mixture of insoluhle protosulphite and soluhle protosulphate of iron, which latter may he used for the copper hath†. The oxyd may also he dried and used as a pigament, or reduced to metallic iron to be employed for the precipitation of copper. To this end it may he mixed with one-fourth its weight of carbonaceous matter and heated to redness in suitahle vessels, by which means it will he converted into iron sponge; or else compressed into cakes and smelted, with the addition of lime, in a small blast furnace, yielding thus cast iron.

Working of the Process.

Preparation of the Ores.—The new method ahove described is now in use at the Harvey Hill mine in Leeds, near Quebec. The ores there treated are a mixture of yellow and purple sulphurets of copper, dressed for the purpose to 15 or 20 per cent., and ground so as to pass through a sieve of forty meshes to the linear inch. The roasting is at present effected on a small scale in a muffle furnace thirty feet long, with a wood fire, the heat passing in flues beneath the floor of the muffle only. With this arrangement, however, only ahout two tons of ore can be roasted in twenty-four hours, and it is proposed to erect, at once, larger and more convenient furnaces. A proper arrangement for roasting, though an indispensable preliminary to the treatment of sulphuretted ores, constitutes no distinctive part of the new process which has for its object the solution and precipitation of copper from naturally or artificially oxydized ores.

Solution.—A Freiberg barrel was used in the earlier trials, hut has since heen advantageously replaced by two circular tubs, made of three-inch spruce plank, measuring seven feet in diameter by five feet in hight, and furnished with closely fitting covers. The stirring apparatus consists of two oblique hlades fastened to a vertical shaft, their ende heing within an inch of the eides, and ahout twelve inches from the hottom of the tuh, which is somewhat convex, so as to diminish the space beneath the revolving blades near the center, and thue prevent an accumulation of ore in that part. Such a tub will hold about five tons of liquid, and may be three-qnarters filled. With twenty or twenty-five turns of the stirrer in a minute it is easy to keep one and a half or even two tons of roasted ore suspended in three tons of liqnid, and if allowed to subside the ore falls so as to leave the stirrer free. The bath used at present is even weaker than that indicated in the foregoing specification, marking ahout 19° Baumé, (specific gravity 1.147), and containing ten grains of iron to the fluid-ounce, or a little over two per cent. Such a bath will, by continued agitation, at a temperature of 120° to 180° F. dissolve the oxyd of copper from a properly roasted ore holding 15 per cent., in six or eight hours. At the end of this time a eample of the washed gangue should not yield too strong boiling acetic acid more than two or three thousandthe of copper. Should boiling nitric acid remove a farther portion, it ehows a defective roaeting of the ore. The stirrer being stopped, the liquid is quickly drawn off through an opening near the bottom by a two-inch india-rubber hose into a large covered settling-tank, where it deposits the finely divided portions of the gangne and the suspended peroxyd of iron. The gangue is washed by agitating for a few minutes with a portion of fresh bath or of brine, in order to remove the copper solution which it retains, and is then ehovelled out throngh a trap eight inches square in the bottom of the tank.

Precipitation.—After three or four honrs repose in the eettling tank the clear copper eolution is drawn off to the precipitating-tanks, which are built like the dissolving-tanks, but with flat hottoms. Here ecrap iron, either of wrought or cast metal, is placed on racks of basket-work near the top and bottom of the tank, which is filled with the hot liquor and closely covered. After twelve hours, if the exposed surface of iron be sufficient, the precipitation of the copper is very nearly complete, and the liquid may be drawn off, passing through a flannel filter to retain any suspended particles of metallic copper, and is ready to be transferred to the dissolving-tank for the treatment of a fresh charge of roasted ore. A little steam injected from time to time either into the dissolving or precipitating-tank suffices to keep the bath at hout 150° F., at which temperatnre the processes of solution and precipitation proceed with rapidity. As a charge of bath can he used once every twenty-four hours, the loss of heat in covered vessels is slight. The vats for the three operations are arranged at different levels, so that the liquors flow from the dissolving to the subsiding and thence to the precipating-tanks. From the last the regenerated bath is discharged into a tight vessel from which, hy the pressure of steam, it is raised to the level of the dissolving-tanks. As both iron and copper are attacked hy the copper solntions, the use of these metals must he avoided in those parts of the apparatus which are exposed to its action.

The use of lime and of sulphurous acid in this process has been already explained. The ores used at Harvey Hill are, however, so calcareous that lime is not needed to decompose the sulphate of copper formed in roasting. A small amount of sulphurous gas from the roasting of the ore is made to pass over the surfece of the hath, through a tuhe entering one side of the closely covered dissolving-tank, while from the other side an escape-tube passes into a chimney, thus estahlishing a draught. In this way it has heen easy at Harvey Hill to keep up, and even to augment at will, the iron contents of the hath. If this becomes excessive, its amount is readily reduced by adding a little lime, or in the case of the calcareous ores now used, by running one or more charges without the use of sulphurous acid. Baths which have been nsed twelve and fifteen times at Harvey Hill, at each time taking up and precipitating two or three per cent. of copper, are unaltered in their composition and as good as at first. The consumption of metallic iron in precipitating, as determined hy numerous trials on solutions prepared as above, and holding from fifty to eixty pounds of copper to the ton, will not exceed fourteen hundred pounds of iron to the ton of pure copper thrown down.

The cost of working copper ores by this process are comprehended under four heads:

1. The roasting and grinding of the ores, and the farnaces and mills for the purpose. Poor ores may be kiln-roasted before grinding, hut rich ores and regulus should he pnlverized hefore roasting.

2. The necessary vats and stirring-apparatus, and the handling of the materials in dissolving and precipitating.

3. The first cost of the baths and the small amount of salt required to supply unavoidable waste, besides, in some cases only, a portion of lime.

4. The metallic iron required for precipitating the copper, which is not more than from one-half to one-third the amonnt consumed in the ordinary processes for obtaining cement copper.

Solvent Power of Protochlorid of Copper. Protochlorid of copper readily attacks metallic copper, forming with it dichlorid. Hence, as already explained, the metallic copper which is eeparated when the protochlorid of iron bath acts on dinoxyd of copper, is at once dissolved if an equivalent of protoxyd of copper be present to yield the requisite amount of protochlorid. The protochlorid of copper will also attack certain eulphuretted componnds of copper. Copper glance, purple copper ore, or artificial products, as regulus, approaching these in composition, are readily dissolved by a solution of protochlorid of copper mixed with common salt, dichlorid of copper being formed. Hence, a sulphuretted ore imperfectly roasted, and still containing a portion of sulphnret rich in copper, will give it up to the action of a bath containing protochlorid of copper.

Some specimens of kiln-roasted Spanish pyrites, still holding kernels of regulus, have been found to yield the whole of their copper to the action of such a bath, but the kiln-roaeting is seldom complete enough to give this result, and a grinding and recalcination will in most cases be found necessary.

The present process has, from the above re-action, an important advantage over those in which the copper is dissolved as a sulphate. The protochlorid of copper in the bath exerts a powerful solvent action on any portions of snlphuret or of metallic copper (derived from snboxyd or otherwise) present in an imperfectly roasted ore. The snlphate of copper, on the contrary, possesses no such solvent power, so that a complete roasting of the ores becomes necessary.

Treatmsnt of Copper Ores Holding Silver and Gold.

The bath of protochlorid of iron and salt, after heing more or less completely saturated with copper, chloridizes and dissolves silver or any of its compounds, in virtue of the well known action of protochlorid of copper. Repeated experiments with the silver and gold-hearing snlphuretted copper ores of Colorado and other regions, have shown that when a properly roasted ore of this kind (or a regulus from suen ore) is treated in the way just described for the removal of its copper, all of the silver is, at the same time, dissolved as a chlorid in the bath, and may he thrown down in the metallic state hy digesting it with metallic copper, or causing it to filter through a hed of cement copper. After thus separating the silver the copper is precipitated as usual by metallic iron. The residue from the hath, having lost its copper and silver, contains any gold which may have been present in the ore, in a favorable condition for removal hy chlorination. Trials on a considerable scale have shown that when a regulus holding at the same time copper, silver and gold, is treated hy the present process for the extraction of the copper, it is possihle, with but little additional expense, to separate from it at the same time all the silver and the gold. The removal of the silver from the bath requires only the use of a portion of the cement copper from a previous operation; while to obtain the gold from the residue the ordinary apparatus for chlorination may be employed.*

In the case of copper ores containing nickel this metsl gradually accumulates in the bath, and when in sufficient quantity may be extracted, after first peroxydizing and precipitating the iron, which would probably be beet effected by forcing a current of air through the liquid previously mingled with pulverized carbonate of lime.

*See the *Engineering and Mining Journal* of New York, for March 8 and 16, also the *American Gaslight Journal and Chemical Repertory*, for March 9, 1870.

†This use has been pointed out in the specification of the United States patent, where it is stated that instead of employing sulphurous acid during the process of solution, "the residue after the solution of the copper may be exposed to the action of the sulphurous acid gas," in order to obtain a soluble protosalt of iron for the bath.

Stock Grazing on the Plains.

The present winter has been a most trying one for the stock grazers in the great territories of Wyoming, Colorado, and New Mexico. The "great heart of the Continent" covered by these territoriee has heretofore maintained a very good reputation for the mildness of its winter climate, considering its latitude and elevation above the sea. This favorable temperature is mainly due to the warm winds which reach that locality from the Pacific shore; but during the winter now passing away theee winds have scarcely been felt there, while, in their etead, that region has been swept by cold northerly blasts from Dakota and British Columbia. The territory of Utah has also euffered more or less from the excess of northerly and the absence of the usual ocean winds.

The effect of this change in the usual air currents has been most noticeable in the obstruction of railroad travel on the Union Pacific Railroad, which traverses the central portion of this region. Its effect npon the stock interest is not yet fully known; but a correspondent of the New York *Tribune*, Mr. R. A. Cameron, who appears to be very well posted with regard to the facts, has given a statement of the condition of the stock interest up to early in February from which we condense as follow:

There has been no suffering among the cattle in Southern Colorado or New Mexico. There has not been over 3½ inches of snow in any of the grazing valleys in the extreme south of Colorado, which has at no time remained on the ground over 48 hours. In the Central and Northern part of that territory, and in Western Nebraska the snow fall on the nsual feeding grounds has been about eqnal with that ordinarily experienced in Illinois; but the cattle were generally removed to more favored spots, and have consequently suffered but little. Reports from four large stock owners, holding 59,000 head report no loss; one person with 8,500 head reports small loss; another with 3,200 reports the loss of 13 head; two other owners report 9,000 and 2,000 head each with losees of 3 and 2 per cent respectively. Of the 20,000 sheep in Laramie valley a loss of 4 to 5 per cent is reported. Horses have not snffered anything to speak of. The proprietor of a herd of 18,000 head kept on the Platte, some 50 miles east of Greeley, reports that his loss will not exceed 2 per cent.

This showing is certainly much more favorahle than the puhlic had been led to expect, from the general reports of the weather for that region, and certainly augurs favorably for the future of stock raising in that great central portion of the continent. The correspondent ahove alluded to promises a full and definite report of the result of the winter's losses hy first of May. He thinks the worst was over in December, and that comparatively hut little will have to be added to that already reported.

He thinks that if each stock raiser would provide a month's feed of hay for his cattle, which might be easily done during the summer, no considerahle loss need ever be feared; even if not needed, safety and a reasonahle oare for onr dnmb animals demands it. Moreover, one feels vastly better if he knows that the safety and comfort of his stock is provided for in case of need. Such a winter as that just passed need not hs expected oftener than once in ten years.

Lemons and Sheep.

We hsve known for years that Los Angeles County produces as fine oranges as we usually see in our markets; hut we never saw a lemon, from there or anywhere else, eqnal to the one rolled in upon us a day or two since hy Mr. C. W. Cook, who, though a resideut of Diamond, Meigher Co., Montana, has just returned from his first visit to Los Angeles. He hrings with him a lemon grown hy the proprietor of the Anaheim Hotel, that measures 15 inches in longitudinal circumference and 11⅛ inches transverse circumference. It was one of many hundred on the same tree, not all as large as this however, hut still the numher of lemons as well as oranges grown upon a singlo tree in one season is enormous.

Our informant counted over three thousand oranges on one tree, and then stopped counting; true it was a ten year old tree, hut a great many much younger trees, had over a thousand each. This fact alone would set at rest the matter of the immense profit derived from orange and lemon culture. Curious to know how many trees were planted on an acre, of the different varieties of fruits, he found them to be nearly as follows: grapevines 1,000; walnut 40; oranges or lemons 60.

From 13 acres of trees, the rows alternating with orange and apple trees in equal numhers, over $22,000 of fruit, orange and apple, was sold in a single season. Mr. Cook represented the country as perfectly charming; the animals ae rolling fat, and the green grass in many places actually up to the wagon axles as you travel over it. He speaks of the great draw hack to the settlement of the country more rapidly than now, as heing the fact that much of it is held hy large proprietors who hold their lands at too high prices.

On the return of Mr. C. to Montana, he takes with him from the coast country a hand of 2,400 sheep, for the mountain pastures that surround his alpine home; which he assures ns is not surpassed hy any other country for sheep growing he has ever seen, not even the heautiful Los Angeles country he has just visited. He drives his flock by way of Walla Walla and the great national road leading eastwardly to fort Benton, known as the Mullen road. He represents Montana as ahounding in immense stock ranges, and that owing to the little snow falling there, an ahundance of food hoth winter and summer is procurahle hy all manner of stock, hut considers it eminently superior for sheep. Mr. C. is one of our earliest subscribers to the PRESS and we have the promise of hearing from him and his Montana stock enterprise at an early day.

THE WING OF THE LOCUST.—If the tip of the wing of the so-called "seventeen-year locust," is placed under a low magnifying power, there will be seen near the fancied letter W (which hae been observed by eome with superstition) a beantiful branching, arborescent appearance, which is probahly due to certain vessels which supply nutriment to the wing. The branches are transparent, and are based on one of the muscular bands of the wing. They appear to he filled with some granular material. Why they appear only at this one spot on the wing has not been explained.

Useful Information.

Wonderful Remains of Ancient Iron Workers.

The *Engineer* of Dec. 15th, 1871, contains a lengthy paper, by Robert Mallet, giving some very interesting facts with regard to the existence, in India, of numerous large masses of manufactured iron, which are found in various parts of that country. These masses consist of large beams or rafters of iron, 20 feet or more in length, and from 8 to 12 inches square. Masses of iron of this description are found among the ruins of ancient cities at wide distances apart, showing that such productions were not confined to any particular locality. But the most notable relic of this character is a large iron pillar, still standing as originally placed, near the city of Delhi. This pillar bears an inscription giving the name of the king in whose honor it was erected, but without date. Its hight above ground is 22 feet; but its depth underground is considerably greater, as it has been followed down, by excavations, 26 feet, without any indications of finding the bottom, or at all loosening the column. It is thought that the entire column cannot be less than 60 feet in length, while the lower diameter is 16.4 inches, and its upper 12.05—the diminution being uniformly 0.29 of an inch per foot. The pillar will weigh about 17 tons. All these remains are very ancient, and none can be referred to later than the 10th century. From the form of the letters on the Delhi pillar, it is known that it could not have been made later than the 3d or 4th century. The letters were evidently made with a punch and hammer.

The Immediate Question of Interest

Connected with such works are—how were they made? The iron is malleable and not cast iron. Specimens taken from the pillar are easily drawn out—a process inapplicable to cast iron. If this mass was forged, how could it have been done with the imperfect appliances known in those days? The possibility of forging a mass of iron by heat or by sledge hammers, which was the only method known in Europe until the present century, was limited by the power of the men to endure, within striking distance, the radiation of the heat from the mass. This limit was reached in England in ship's anchors, the largest of which were welded by 24 "strikers," trained to strike in time, with 14 to 18 lb sledges, and it is claimed that the proportion of heat radiated by these largest anchors, when compared to the Delhi shaft is as 64 to 201. The impossibility of welding such a mass by hand is apparent.

With regard to the possibility of this shaft having been cast, aside from its unmistakable, malleable character, the fact is interposed that the iron workers of those days, so far as we have any knowledge, never constructed furnaces that would turn out over 100 pounds of iron at a charge; hence it would require that at least 400 such furnaces should be tapped at one time to form such a casting. The manifest impossibility of such a thing must be apparent to every iron smelter.

Now were the ancient iron workers of India acquainted with mechanical appliances which have not been excelled by anything of the present day? Mr. Mallet seems to leave the question at this point as an insoluble metallurgical enigma.

A Possible Solution of the Problem.

In the issue of the *Engineer* for Jan. 12, 1872, Mr. George M. Fraser comes to the rescue with an ingenious and very plausible theory. It is pretty well established that the natives of India never did and do not now make cast iron, although the Chinese do. All the iron manufactured in India is from black magnetic oxide, which, in the furnace is not converted into cast iron, but into a mass of malleable metal, presenting in some parts a crystalline, in others a fibrous fracture. This product, not fluid, is removed from the furnaces by allowing them to cool, and then breaking away the front, so as to allow the removal of the charge in a mass. Of course the heated and plastic mass settles down to the bottom and takes the form of the lower portion of the furnace.

Now suppose a furnace built with the interior of its lower portion corresponding to the size and shape of a section of the column or beam wanted. Let a number of these sections be thus formed by separate furnace charges, so that when put together, endwise, they will constitute the column or beam desired. All that is needed is an end or butt welding of the pieces. It is well known that this kind of iron welds at a very low heat—much lower than that required for wrought iron, and there is no very great stretch of probability required to suppose the accomplishment of such a thing by even the present native iron workers of India, who it is known are able to effect a very fair weld of shafts 6 and 8 inches in diameter, with open charcoal fires. The sections from the furnaces as above, could be easily prepared, by heating and hammering, to make good joints, and then only a surface heating, with very little hammering upon the end of the section would be required to effect a weld, that, to the eye, would be very passable. Of course iron so constructed and welded could not be expected to stand any great tension, such as is endured by wrought iron shafts built up from regular blooms or from longitudinal bars by modern appliances. No such test has ever been applied to the Delhi column or to any other of the India remains, and the probability is that a comparatively slight blow, as from a cannon ball, would separate this shaft into two or more fragments, the breakages taking place at the welding joints.

The Telegraph as an Errand Boy.

New uses are constantly being devised for the telegraph, the latest of which is to employ it as an errand boy, as follows: A company has been formed to establish offices at convenient places in various parts of New York, whence messengers can be sent, on demand, to any house within the respective districts. These offices are to be connected by telegraphic wires with the houses of such persons as pay monthly $2.50 for the benefits. The occupants of a house, by touching a key, will simply give notice at the office that a messenger is wanted. The offices will be numerous, and so distributed that a house can be reached by a messenger within three minutes after the notice. It will be the duty of the messenger to go on any errands required of them, to any part of the city, the persons employing them to pay the company fifteen cents for every half hour of service.

It will be seen at a glance that this system will bring many conveniences; but all its advantages cannot be appreciated until it has become a necessity of domestic life in all large cities. There are thousands of little services which persons in moderate circumstances would gladly pay for at the rates named, but they cannot afford, or do not desire to keep an errand boy, or other male house-servant. But the plan promises safety and comfort. It will afford security against burglars at night, and a ready means of calling a physician or a friend in cases of illness. If burglars are in the house, two touches of the key will bring a policeman at any hour of the night. In cases of fire, too, the system would be invaluable; many small fires become great ones on account of the unassisted efforts of servants or members of the family to suppress them without a general alarm. Indeed the more one considers the uses of the proposed system, the more they multiply themselves, and we confidently predict that we shall be wondering how our ancestors got along without it.

How to Shave.—As you strap your razor, strap the two sides alternately, and keep the back of your razor always on the strap, as you turn it from side to side. You thus avoid cutting your strap and turning the edge of your razor. As you shave, keep your razor almost parallel with the skin, and not at a great angle with it. Give your razor also a slight lateral motion. In fact, to borrow the simile of the artist, "the more you can make your shaving like mowing grass with a scythe, the better." Do not make faces as you shave, with the object of making a better surface for your razor to act upon. The skin when strained is easily cut. Adopt these hints and you will bless the unknown giver.

New Use for Paraffin.—Dr. Vohl announces that mixed with benzole or Canada balsam, paraffin affords a glazing for frescoes much superior to soluble glass. By covering the interior of wine casks, with a film of pure white paraffin poured in melted, he has effectually prevented the spoiling of the wine and its evaporation through the wood.

Good Health.

A Man With a Watch Key in His Lungs.

Mr. Eli Hempstead died a short time since in New Haven from a most singular cause. Some years ago he was attacked with insanity, and was sent to the Insane Retreat in Boston. While there he pushed a watch key up his nose, and after his recovery informed his physician what he had done.

An effort was made to get it out, but without success. He left the Retreat and nothing further was done to remove the article, though he occasionally spoke of feeling it. In a year or two he was attacked with a sharp pain at the lower end of the right lung. He suffered from it for some time, when it passed away, and for two years he enjoyed good health. A few weeks ago he went to New Haven with an invoice of produce, and while engaged in lifting barrels was again attacked with pain and bleeding from the lungs.

He was taken to his father's house, where, in a few days he died. His case was so singular that the physicians made a post-mortem examination, when they found the key embedded in the lower part of the lung and surrounded by a lump in a state of mortification. The key had dropped out of the nose through the windpipe into the lung, and had remained there over four years.

Skin Grafting.—A late number of the Indiana *Medical Gazette* contains an account of three successful cases of skin grafting. This curious operation is as follows: A patient is suffering from a large ulcer. The worst is, however, over, and the ulcer is healing. But nature works too slowly for modern surgery, so a piece of skin is cut from some other part of the body and planted in the sore. At first, it seems to have failed, for the graft disappears, evidently absorbed into the wound, but in a few days a speck of healthy skin appears in the centre of the raw surface. The transplanted piece has, in fact, taken root. The speck now rapidly spreads, other grafts are made to take root, becoming each of them centers of a new growth, which, as they expand, join each other, and in a very short time cover the site of the ulcer with a smooth and healthy skin.

Not long ago an experiment was tried in a London hospital of grafting a negro's skin on an ulcer of a white child, to see if the pigment cells would be reproduced. The experiment failed, as the bit of skin died. The authors of the cases quoted in the Indiana *Medical Gazette* do not say whether the skin reproduced after grafting was the same color as that of the rest of the body or the pink color so often seen in the scars on natives' legs. This is a point which would be interesting to know.

The Right and Left Hand.—The generally accepted doctrine is that the pre-eminent use of the right hand is due to the force of education, without any natural tendency in physical formation. But an eminent physician in discussing this question takes the opposite ground. He insists that the preferential use of one side is not limited to the arm, but extends to the leg, which is not subjected to education. The tendency to use one side more than the other manifests itself before education begins.

Left-handedness is a physical malformation. Monkeys and parrots show a tendency to use the right side, preferentially. In properly developed persons the left hemisphere of the brain is the larger, as are the left arteries, and independently of the size of the vessels, the stream of blood is less hindered on the left than on the right side.

Hygienic Application of the Spectroscope.—The water used by the people of a crowded court, amongst whom several cases of typhoid fever had appeared, was drawn from a rather shallow well, and was highly charged with various unoxidized compounds of nitrogen. It was suspected that, from some defect, the contents of a public urinal obtained entrance to the well. The fact that the well water contained seven times as much common salt as the normal water of the vicinity was some confirmation of the suspicion. Prof. Church obtained absolute proof by the following method: He introduced two grams of a lithium salt into the urinal, and, two hours later, was enabled readily to detect with the spectroscope the presence of lithium in a liter of the well water, which by previous examination had shown no trace of this substance.—*Quarterly Jour. of Science.*

Scarlet Fever Non-contagious.

Dr. E. H. Lewis, in an interesting article published in the *Northwestern Medical and Surgical Journal*, states some striking facts bearing upon the contagiousness of scarlet fever. From data, gathered during an epidemic in 1870, the doctor concludes that scarlet fever is not caused by sewer gases, or marsh miasms, or decayed vegetable matter, impure water, or the habits of people; for in the cases observed by him all these causes were absent. The epidemic traveled directly and rapidly through well-drained and elevated regions of country, sweeping everything before it. In the cases observed, the doctor could find nothing to enable him to believe in its contagiousness. He says: "I have not the slightest doubt that the causes of scarlatina depend upon some peculiar condition of the atmosphere favorable to the propagation of the scarlatina poison, and that it travels in a manner similar to epidemic cholera, the principal feature of which it simulates, the difference being that in cholera the force of the disease is spent upon the bowels, while in scarlatina it is expended upon the skin and throat."

A Case for the Doctors.—A singular case came under the notice of John B. Thayer, at East Cambridge, on Thursday. He was called to a house on Charles street to attend an old lady, Mrs. Mary Carton, who was there lying with both thighs fractured. The patient is 76 years old and bedridden, though not troubled with any specific disease. While her daughter was assisting her to rise, a noise, like the snapping of a whip, was heard, followed by one of a similar character, and the old lady suddenly sank to the floor. Upon examination both thigh bones were found to be fractured. There was no abrasion of the skin or external marks visible. The doctor states the cause of the fractures to be from muscular contraction, occasioned by long disuse of those functions, and though a similar case has never come under his immediate observation, it is a matter of record that such cases have been known, but they are extremely rare.—*Boston Transcript.*

Foreign Substances in Living Flesh. Mr. J. W. Bangman of Baltimore, Md., writes that a lady recently ran a needle into her flesh, about three inches above the knee, breaking it off under the skin. She preferred to risk the consequences rather than to have it extracted by a doctor. Mr. Baughman thought of using a magnet, and applied one of the horseshoe shape, 8 inches in length. She wore it for two days, more or less, and then found the point end of the needle protruding from the skin, one inch from where it entered. The needle was easily removed. Our correspondent is curious to know how the needle could come to the surface point upward, having thus turned round in a space less than its own length, which was 1 1-16 inches, and he suggests that the muscles may have turned it about.

Protruding Teeth.—A child's teeth may be gradually pressed into proper shape by the application of a rubber band, which any first-class dentist can put on and attend to at intervals. That any child should be doomed to go through life with ugly, misshapen teeth, is but too common a fault of parents, whose omission of duty in such matters is something a child, in maturer years, finds hard to forgive. Science and art have advanced to such a degree in the present age that excuse for physical deformities of any sort, to be allowed to become prominent, is only another name for gross, unpardonable carelessness.—*Herald of Health.*

Nose-Shaper.—Those who are cursed with an ill-formed nose, can now, accordcording to the London *Court Journal*, have it "quickly shaped to perfection" for the ridiculously small sum of ten shillings and sixpence. A contrivance has, it seems, been patented by an enterprising London tradesman which, "if applied to the nose for an hour daily," so "directs the soft cartilage of which the member consists," that the ugliest proboscis in creation, becomes "in a few days" a nose worthy to figure upon a *chef d'œuvre* of Phidias.

Poisoning by Mercury.—Dr. Melsens of Brussels has found potassium iodide to be a preventive of poisoning by mercury, as it conducts off the mercury in a soluble condition in the urine. He recommends that the workmen be given wine containing iodine before and during their work not as a medicine, but as a pleasant refreshing drink.—*Revue Universelle.*

Scientific Press.

Gold and Legal Tender Rates.

SAN FRANCISCO, Wednesday, March 13, 1872.—Legal Tenders buying 91¼; selling, 91¾. Gold in New York to-day, 110¼.

Table of Contents.

EDITORIALS.—The Proposed New Land Policy; Mining Discoveries; Too Wet to Plow; Buy the Right Fruit, 161. Loss of Quicksilver; Mining Accidents; The Paul Process, 168. New Incorporations, 169.

ILLUSTRATIONS.—Wright's Improved Saw Gauge, 161. Bozeman City, Gallatin County, Montana, 169.

MECHANICAL PROGRESS.—Contact of Belts with Pulleys; German Prizes for Improvements; Steel-Headed vs. Steel Rails; Hooping Boiler Flues; Conveying Power Over Telegraph Poles, 163.

SCIENTIFIC PROGRESS.—Do Plants Derive their Carbon From the Earth; Rupture of Iron Wire by a Blow; On the Melting and Regelation of Ice: Temperature of the Sun; Manufacture of Brandy from Sawdust; Sulphide of Bismuth, 163.

MINING SUMMARY.—Reports from Mines in various States, Counties and Districts; Stock Reports; Markets. Etc., 164–5.

USEFUL INFORMATION.—Wonderful Remains of Ancient Iron Workers; The Telegraph as an Errand Boy; How to Shave, 167.

GOOD HEALTH.—A Man With a Watch Key in His Lungs; Skin Grafting; The Right and Left Hand; A Case for the Doctors; Hygienic Application of the Spectroscope; Scarlet Fever Non-Contagious; Foreign Substances in Living Flesh; Protruding Teeth, 167.

DOMESTIC ECONOMY.—Wood Fire; Italian Chicken Salad; Look Most to Your Spending; Preserved Meats; Bean Soup; To Make Bread From Flour that Runs; Good Advice; Chicken Jelly. MECHANICAL HINTS – How to Use Grindstones; Brown Tint for Iron and Steel; To Draw a Curve, 171.

MISCELLANEOUS.—Continuation of Veins in Depth; Mining Investments; Sewing Machine, 162. Lemons and Sheep; The Wing of the Locust; The Hunt & Douglas Process for the Extraction of Copper from its Ores—No. 4; Stock Grazing on the Plains, 166.

ORE SAMPLED.—J. W. Thurman, 413 and 415 Mission street, crushed and sampled the following lots of ore during the month of February: 143 and 59 sacks from the Arizona mine, Humboldt Dist.; 105 from the Sheba, same district; 2,100 and 160 sacks of copper ore from Battle Mountain, Nev.; 499 sacks of copper ore from Salt Lake; 826 sacks of antimony from Mill City, and 145 sacks of silver from Prescott Dist. The whole amonnt sampled was 4,037 sacks.

EUREKA CONSOLIDATED.—The recent development in the Eureka Consolidated mine is said to be something wonderful. A dispatch dated the 9th inst. says that no adequate conception can be formed of the number of tons in sight, and that it looks as if the vein could be worked for years without having to stop either furnace or mill.

ANOTHER RARITY.—A genuine mnsk deer *(moschus meschiferous)*, from the East Indies is the latest novelty added to Woodward's Gardens. Althongh it resembles the ordinary deer it is not larger than a hare. It is from the male of these animals that the celebrated perfnme, so much admired by some perverted tastes is derived.

RUMOR.—The Plumas County *National* says it is rumored that Parrot & Co. have disposed of the Eureka Mining property to an English company for $1,750,000.

HON. A. A. SARGENT, AND JAS. S. GRINNELL, Chief Clerk of the Patent Office, have our thanks for documents received.

PROF. SILLIMAN is on his way to California.

Loss of Quicksilver.

In treating roasted silver ores in pans, a great loss of quicksilver is found to be the result of almalgamation. Three pounds to the ton of ore is generally admitted, but when it is abovo three nobody likes to let it be known. There hss been a disenssion in the papers as to whether the loss of mercury shonld be expressed relatively to the amount of silver obtained, or to ton of ore. It seems to be immaterial to which of these two ways the preference is given, ss none indicates the nature or the reason of the loss. Neither is the chemical loss more important thsn the mechanical. If, for instance it were stated one pound of mercury is lost to one pound of silver, it would give net the slightest evidence whether this loss is due to defective roasting, to the abundance of base metals, or mismanagement in amalgamation; just as if one would say:—"One peund of mercury is lost to a ton of ore," the latter expression, however, is more convenient and customary.

At a clese investigation of the amalgamating process in pans, the question arises whether or not a real chemical loss of quicksilver occurs; that is, whether the quicksilver, by chemical action, is transformed into such a combination, that when formed, it must be considered irrecoverable, a positive loss, as theoretically explained, with the formation of calomel in the patio amalgamation. Iu examining pan tailings, also if eoucentrated, with the greatest care, no calomel can be discovered, and if a light gray powder is found, under a micrescope, it proves to consist of metallic quicksilver globules. This, however, does not exclude the probability of calomel being formed in pans during the amalgamation; but it is an important fact, that if formed, the calomel dissolves in a solution of salt and chlorides, especially in a hot pulp, as is always the case during the amalgamation. Whether it dissolves directly or iudirectly is not the question now; the fact is, it does dissolve, and from this solution metallic quicksilver is precipitated by iron, copper, etc.

It seems, therefere, it is the mechanical loss of quicksilver principally, against which the millman has to guard and to strive to diminish it by proper mechanical arrangements. Certainly, ore containing a great deal of copper, lead, antimony, etc., and roasted in the ordinary way, attacks the quicksilver vigorously by chemical action causing a considerable loss; it consists mostly of quicksilver in a metallic bnt different aggregate condition. Very minute globules are coated with iron, perhaps half amalgamated, and there seems to be an attraction between these globules, as many of them adhere together forming a light, blsck snbstance, a kind of poor amalgam, containing iron and other base metals. Its inconsiderable weight, and its dark color is the reason of its escaping notice. When a settler is discharged the amalgamstor examines the tailings now and then (or ought to do so,) by washing it in a cup or horn-spoon, and his attention is directed to the quicksilver globules or scum that may remain, but he is sure to wash off all of the light black amalgam without knowing it, and it seems that this stuff is the main source of the loss of mercury.

The origin of this amalgam is due to different circumstances, abundance of base metals, the chlorides of which are not decomposed in roasting, but more or less of this amalgam will be formed according to the treatment in pans. It will be increased by too much heat; 125 to 150 degs. is sufficient for a good amalgamation of all well roasted ore, but generally the temperature is kept a great deal higher—up to 200 degrees and above. It increases the loss of quicksilver, partly in a slight degree by evaporation, but principally by producing that black amalgam. There are cases where iron amalgam of white color is obtained in great quantities; to this I do not refer now. The black amalgam in question will be formed more or less under almost any circumstances, also if a tolerable firm amalgam is obtained in the strainers, giving a bullion from .600 to .700 fine.

In order to have all dissolved quicksilver precipitated, and the base metal chlorides as much as possible decompesed (the latter in absence of iron being effected by direct aetion 'of the quicksilver,) there must be sufficient iron (best is wrought iron) in the pans. In many mills it is customary to amalgamate the roasted ore without grinding. In this case, especially if rich ore is treated, all the iron in the pan is coated with amalgam, the surface of shoes and dies included, so that there is very little chance left for the dissolved quicksilver to eome in direct contact with iron. For this reasen, not te consider other advantages, a grinding of one hour or one and a half, before quicksilver is introduced, is necessary; it offers to each new charge of ore a great snrface of clean metallic iron.

Only a small part of the black amalgam is saved by the settlers, the motion being too quick to allow a sinking of the light stuff through the pulp; the most of it is therefore discharged with the tailings. In this amalgam the iron does not adhere to the quicksilver as if it were real amalgam, but can be separated by more friction. For this purpose, however, it must be obtained in a concentrated condition, and Hendy's concentrator, with a slight alteration, does the work to satisfaction. The concentrator requires proper care and attention, otherwise it is useless. From the settlers the pulp is discharged through ¾ inch holes into the concentrator, where quicksilver aud the black stuff is retained. The concentrated part is then charged iuto a Knox's or other similar pan, and ground for several hours, with not too mueh water, and dilute after sufficiently fine.

Another source of the loss of quicksilver will be found in retorting the amalgam. Even when a proper heat is given to the retert and proper time allowed, the crude bullion will contain in most cases 2½ to 3 per cent. quicksilver, and if there is a great amount of lead in it, say 60 to 80 per cent., the quicksilver may come up to 5 per ceut. and more, even if kept in a molten state for 8 hours in the retort. The larger the rotort and the smaller the charge, the more quicksilver remains in the bullion. An increase of heat to light redness is of no avail and only iujurious to the restort. When rod hot, a retort is filled with quicksilver vapors, by which the air was displaced; after 10 or 12 hours, when no more quicksilver is coming, tho space remains filled with vapor, as there is nothing to drive it out. On cooling, the mercury condenses and draws back into the bullien. A round retort of usual size contains about 3 pounds of quicksilver in vapor. The introduction of superheated air at the end of the operation, would probably carry out all the vapor of mercury and insure a well-retorted bullion. This would be an improvement, not only on acconnt of saving the quicksilver, but because the melting of such bullion is injurious to the melter. Having much bullion on hand, generally not more than one hour is given to cast a bar. If, after skimming, a piece of red hot iron is held in the crucible above the molteu silver, and in the next moment withdrawn, quicksilver will be seen swimming on the water. The most of the shipped bars contain quicksilver.

A MONTANA ARTIST.—The sketch, from which our engraving of Bozeman City was engraved, was made hy John Erikson, Esq., of that place, a young artist of much promise. It is pronounced by Montanians now in this city, an excellent representation of the metropolis of Eastern Montana.

Mining Accidents.

An Austrian, name unknown, was killed in the Eureka mine, Sutter Creek, on the 1st inst. by the falling of a large stick of timber.

John McPhee was killed in the Silver Plume tunnel near Georgetown, Col., a few weeks since, by a large rock which fell upon him.

H. H. Chandler of Silver Park Nye Co., Nev., lately had his hand terribly mangled by being caught in the machinery of his quartz mill.

John Healy has had his foot quite badly injured by catching it between the edge of the cage and the sill timber in the Belcher mine.

The Jacksonville *Ledger* says that two Mexicans working on a tunnel near the "Gate" were seriously hurt by a cave last week.

Wm. Osborn, working in Gentry & Co.'s claims on Oustomah Hill, received severe contusions and cuts on his head while running out of a tunnel to get out of the way of an expected rush of water that had been blocked up.

Patrick Maguire a miner at work for the Cherokee Co., iu Butte county, was caved upon in the claim lately and his leg crushed badly.

THE PAUL PROCESS.—In another colnmn will be fouud some certificates from parties who have had practical experience with Mr. A. B. Paul's dry amalgamating process, and who speak very highly of the results attained by its use. We have had the pleasure of conversing with Mr. Smyth, Supt. of Sprague & Co.s' mill, on the subject of this process, and he assures us that after the experiments made under his personal supervision, he has no doubt but that it will entirely supercede the eld system of par amalgamation. We have given before a detailed accouut of the process and at that time were satisfied that the plan would be a success. Mr. Paul has labered assiduously in perfecting the mechanical detail connected with the machinery, and is now resping the reward of his perseveraunce. He is now constructing a new mill to go to Calaveras couuty. Miners and mill men will do woll to read the certificates above alluded to, for the system has most certainly given new life to Dun Glen, where it has been in practical operation for some time. Any process that will work ore as close to fire assay as this doos, must eventually come into general use aud assist materially in increasing the bullion yield of the connty.

THE NEW IDRIA MINE.—The indefatigable McGarraham is at it again. He is still pushing his claims before Congress and we understand has instituted suit in the Third District Court at Monterey, against the New Idria Mining Co. for possession of the mine and its appurtenances and $5,000,000 for wrongful attention, rents, profits etc. He has been defeated so often in his attempts on this that any ordinary man would have got tired of it before this, but he seems determined not to give it up.

A VEGETABLE CURIOSITY.—It was the *Chronicle*, we think, that a day or two since said: "Two trees are pointed out to the curious visitor at San Diego which grow with their leaves in the ground and their roots in the air, a peculiar way which trees down there probably have of asserting and maintaining their independence."

The author of that item didn't know much, or he would have given us the true botanical name of that species of tree. The variety growing in that locality, when telescopically examined through the bottom of a tumbler, is found to he the obfuscated ocularium, of Linnæus, or Whiskied Intellecticus of modern botanists.

THE COLUSA Manufacturing Company have brought suit against the Buckeye Quicksilver Mining Co. to recover $10,000 damages for alleged breach of contract.

Settlement and Development of the Gallatin Valley.

[By our Special Traveling Correspondent.]

"The smoke-wreath curling o'er the dell,
The low—the bleat—the tinkling bell,
All made a landscape strange,
Which was the living chronicle
Of deeds that wrought the change."

The Gallatin Valley, in Montana Territory, is, next to the Great Salt Lake Valley Basin, the most extensive agricultural district of the Rocky Mountains, and is in all respects the peer of the latter as a farming country. Being immediately on the line of the Northern Pacific railroad, which cannot leave it entirely either to the north or south, and will probably traverse it throughout its length of 45 miles. It is beginning to attract much attention on the Pacific Coast and through the Western States. Therefore I am convinced I cannot use my pen more commendably than by giving a history of the settlement of this interesting section, its present condition and prospects.

Though very properly termed the "Granary of the Territory," the Gallatin Valley's present developments are the immediate results of and wholly owing to gold mining. The Pick made way for the Plow. Little attention was given to agriculture in Montana until the spring of 1864, though for two years previous the mining world had been in a blaze of excitement over the fabulous gold discoveries reported from the Upper Missouri, during which time gold-hunters had been flocking to the new El Dorado by thousands. But among them all there was probably not one who intended or expected to till the soil; in the wild pell-mell practical thoughts and calculations were unknown; they had come to dig out a certain quantity of gold, which they would return to enjoy. Four acres of potatoes yielding ordinarily well, would have brought them at that time, the snug sum of six thousand dollars; and an extraordinary yield, such as is not unusual in the Gallatin Valley at this time, would have netted double that amount. Freight from Salt Lake City ranged from $15 to $30 a hundred, and potatoes, cabbages, turnips, etc., found a ready market in the new diggings at from 25 to 40 cents a pound. But no one thought of raising a crop, though hundreds were toiling from daylight to dark in the mines.

The Earliest Prospectors.

The discovery of the rich placers of Alder Gulch, late in the fall of 1862—the most continuous placer deposits ever developed—brought the restless tide further north and within a day's ride of Gallatin Valley. It and all the adjacent country was over-run with prospectors early the next spring. We may well believe these fortune-seekers were intoxicated with delight as they reined in their "broncos" on the high tablelands, from which they had their first view of the Gallatin Basin, more especially as their travels, so far, had been over rugged ridges and across contracted creek bottoms scarcely extensive enough for a California farmer's calf pasture. Below them, stretching away to the north, the east and the west, and all in plain view through the clear, pure mountain air, was over half a million acres of ranky grassed valley land,—in gentle undulations it rolled on and on to the distant mountain walls. Since descending the summits that overlook the central plains of Utah, they had seen no region so inviting as a field for agricultural labor, and nowhere a picture of undeveloped Nature so enchantingly beautiful and impressively grand. There, all encompassed by a single sweep of the vision, were three noble currents—the West Gallatin, the Jefferson and the Madison—pouring down to the great basin from opposite directions and winding away with their myriad tributaries, through dense groves of cottonwood, alder, ash and willow, and the most nutritious grasses on the face of the earth, to unite their waters where the flourishing village of Gallatin City now stands, and form the second mightiest river of the Continent.

The influence of such a scene was too strong for even the fascinations of a gold-hunter's life, and projects of carving the lovely wild landscape into comfortable homes happily succeeded, in many instances, the dream of making fortunes in a day through blind luck. A few hay ranches were selected and "staked off" at once—hay then being worth from fifty to seventy-five and even a hundred dollars a ton in the mines—and the locators hurried back to the diggings to prepare to make them available. And a "stampede" for farms in the Gallatin valley was next in order. But it was then too late in the season to think of farming in the Gallatin valley that year, though a few plows were improvised for the occasion and some summer fallowing was done preparatory to the next year's operations; and the spring of 1864 found quite a colony settled around the head of the Missouri, near the mouth of the Gallatin, Jefferson and Madison rivers, and a few farms were also being opened in the upper part of the basin, in the vicinity of the present site of the vigorous young city of Bozeman—now outstripping all competitors in the race for commercial supremacy. Of course there have been special causes to accelerate the development of the Gallatin valley; but without such special agencies her progress would have been steady and healthy, for richness and extent of soil, desirability of climate, unexcelled facilities of water-power, and forests of noble timber, are among her natural advantages. My task would not be fully performed, however, if I omitted to notice the more prominent influences which have contributed so much to her wealth and prosperity.

Flour Mills.

In the summer or fall of 1864, the indefatigable Perry W. McAdow, with his mining partner, Thomas Couver, now engaged in agriculture in Los Angeles county, California, located a site for a grist-mill in the upper part of the valley, and had the necessary machinery on the road soon after. This gave an impetus to the settlement of Gallatin valley, just when such encouragement was needed, and the smoke from a score of new farm-houses was curling to the sky within sight of the pioneer grist-mill before its burrs had made a single revolution. In the meantime the energetic Wilson brothers had begun the erection of a large grist-mill in the lower part of the valley, at Gallatin City, 35 miles below the scene of McAdow & Co.'s enterprise, which equally stimulated settlement and development in that portion of the Gallatin basin. Then McAdow & Co., believing the Gallatin valley destined to become one of the most populous farming sections of the great West, (a hope now fully realized) still further manifested their confidence in its future by the erection of a saw-mill, which speedily did away with the "whip-sawing" method.

John Auld, J. J. Tomlinson and others, seeing McAdow & Co. were unable to supply the demand for lumber, erected other saw-mills in different parts of the valley, the same year. And in the summer of 1866, the capacity of the two grist-mills being found inadequate to meet the increasing demand of the wheat-growers, Captain Reuben Foster commenced the erection of the Union Mills, at Spring Hill, about 15 miles north of Bozeman—a two-story edifice capable of turning out fifteen thousand pounds of flour a day—and the next fall had it in successful operation. Your correspondent paid the Union Mills a visit, and must admit that it is the most complete flouring establishment he entered in his extensive tour through the Rocky Mountains. Under the management of its present enterprising and efficient proprietor, Andrew Pierstorff, Esq., its trade-mark holds its own with the world-famed St. Louis brands—which, in fact, the home productions have almost entirely driven from the local markets.

Churches and Schools.

With the true spirit of the American pioneer, the early settlers of the Gallatin valley, notwithstanding their exciting race for material prosperity, ever kept moral agencies in view, and the church and school received their first attention as soon as the family hearth-stones had been securely laid. Thenceforward immigration, still increasing, was made up largely of families, so that by the fall of 1866 the population and wealth of Gallatin county—now regularly organized—made her a power in the Territorial Legislature and in general business circles, and the Gallatin valley was universally admitted to be one of the safest fields for permanent investment.

Indian Troubles.

But, as might have been expected, some adverse clouds shadowed our infant empire. To the eastward, just beyond the dividing range between the Yellowstone and the Gallatin, was the fierce and powerful Crow tribe of Indians—since, under a benign and wise policy on the part of the general government, elevated to semi-civilization—and their depredations were very frequent. And danger was more imminent in the upper part of the valley—the most populous section—from the fact that Bozeman City is located in the very mouth of a low pass leading to the Yellowstone valley, as our cut shows, which can be traveled by any mode, winter and summer; consequently the majority of the settlers were kept in a state of constant uneasiness and alarm, knowing that any hour an incursion in force might take place, the result of which would certainly have been massacre and destruction of property throughout the settlement.

This perilous state of affairs continued until the spring of 1866, when Col. John Bozeman—in whose honor the metropolis of eastern Montana was named—was horribly murdered by Indians within a day's ride of the settlements, and another prominent citizen who was with him, made a hair-breadth escape. The survivor's horse was not yet cool after his arrival at Bozeman, when reliable scouts came in with the alarming news that the ferocious Red Cloud and his blood-thirsting followers were marching on the settlements with the intention of murdering all the whites, running off their stock, and giving to the flames all their improvements. And that these fearful threats would have been carried into execution, had it not been for the protective measures immediately inaugurated by acting Governor Thomas Francis Meagher, there cannot be the slightest doubt, for Red Cloud was really coming. As it was, the effect was disastrous enough; business, in all its branches, was paralyzed, and those having families abandoned their homesteads and fled for their lives. The call of the executive for troops was responded to promptly and with enthusiasm in all parts of the Territory, but for a while it was feared the protective movement would utterly fail and the valley be given over to rapine and destruction, owing to the general unwillingness on the part of the merchants to advance supplies. At this critical juncture it was that Col. Leander Black, a capitalist of rare sagacity and enterprise, and a humanitarian in the fullest sense of the word, came forward and made himself the savior of eastern Montana.

Our Illustration.

The surveyors have been through the pass shown at the right of our cut and it is considered the best route for the Northern Pacific R. R. The mountains in the vicinity of the town are rough and precipitous, but the valley is covered with fields of grain. At the mouth of the pass is situated Fort Ellis, erected there some time since. The buildings are substantial, the lumber from which most of them are built being abundant near by. The flour mill is seen a short distance this side of the mountains. Besides the hotels, which may be recognized, the stores and public buildings are on Main street. The residence of Col. Black, on Black street, is the house surrounded by trees, in front of which stands a horse and buggy. W. H. M.

(To be continued with other illustrations.)

BOZEMAN CITY, GALLATIN COUNTY, MONTANA.

New Incorporations.

The following have filed certificates with the County Clerk, San Francisco.

St. John M. Co.—Mar. 9. Location: New El Dorado Mining District, Kern county. Capital stock $600,000, divided into 6,000 shares. Trustees: Joseph Badger, F. A. MacDougall, J. P. Newmark, Joseph Clark and A. T. Swart.

San Francisco Lake Water Co.—March 12. Capital stock, $3,500,000, in 35,000 shares. Trustees: Peter Donahue, Nicholas G. Kittle, John P. Jackson and F. D. Atherton. Place of business; San Francisco.

Primrose G. M. Co.—March 12. Location: Sierra county. Capital stock, $2,400,000, in 24,000 shares. Trustees: S. Steinhardt, George F. Sharp, Philip Falk, Wm. Seligeberg, and A. J. Bryant.

Puebla G. S. M. Co.—March 12. Location: Hot Spring District, Humboldt county, Nevada. Capital stock, $3,000,000, in 30,000 shares; place of business San Francisco. Trustees: A. Hemmo, James C. Weir, and James Blake.

Grover M. and M. Co.—March 12. Location: Drytown, Amador county, Cal. Capital stock, $1,000,000, in 20,000 shares; place of business, San Francisco. Trustees: Cyrus Wilson, John S. Wilson and T. Ashby.

Pacific Box Manufacturing Co.—March 12. Capital stock, $200,000 in 4,000 shares. Trustees: Howard Chapman, L. L. Robertson, B. F. Baretow, James L. Blaikie, C. J. Cousin; place of business, San Francisco.

The rainfall in this city up to Tuesday noon last, was 33.23 inches.

Domestic Economy.

Wood Fires.

We often wonder why in an age abounding in inventions for household comfort, the oldeet and heet of all—the wood fire on the hearth—has almost disappered. It cannot he on the ground of its greater expense, for that it is hut a trifle compared to luxuries we see everywhere. Scrupulous housewives, we helieve, object to it as untidy. But from such pharisaic regard for the outside of the cup and platter may we be delivered? Now, in the first place, nothing keeps the air of a room so fresh and sweet as an open wood fire. Its advantages in point of healthfulness over ordinary ways of warming is immense. For a room of ordinary eize in this climate it gives amply sufficient heat. And what a wonderful promoter of cheerfulness it is? It ie as much hetter than the open coal fire as that ie better than the hlack hole in the floor called a register. Its voice, as its purrs and crackles and roars, ie enough to drive away the worst fit of the blues. Its mounting flames give the cheeriest light in the world. The depths of its glowing coals coutinually allure and charm the eye. There are are not many human beings who are as good company for every mood. Afthe day's work and fret it brings calm and cheer. It wiles away all trouhling thoughts. If the mind ie at work, ite unobtrueive companionship soothes and aids. When one ie weary, he may find restful occupation in watching the freaks of the flames, and lietening to their changeful voice. It brightens people and brings them together. To what sceues of friendship and eocial enjoyment doee it lend a unique charm! It is the luxury of luxuries, a thing without which life is incomplete.—*Beecher.*

Italian Chicken Salad.—Make a dressiug in the proportion of the yolks of three hard hoiled eggs, ruhbed fine, one salt spoonful of salt, one of mnetard and one of cayenne pepper, one of white sugar, four table spoonfuls of salad oil, and two table spoonfuls of vinegar. Simmer this dreesing over the fire, hut don't let it boil. Stir constantly while over the fire. Then take a sufficient quantity of the white meat of cold chicken for thie quantity of dressing or increase in this proportion to the deeired quantity; pull the white meat into small flakes, pile it up in a dish and pour the dreseing on it. Take two heads of fine, fresh lettuce that have been washed and laid in water, take out the hest part, cut it up and arrange in a heap or around the chicken, heapcd in the middle of the dish, and on the top of this ridge place the white of eggs, cut in rings, and laid in the form of a chain. A portion of the lettuce to he helped with each plate of chicken.

Look Most to Your Spending.—No matter what comes in, if more goes out, you will always be poor. The art is not in making money, but in keeping it; little expenses, like mice in a harn, when they are many, make great waste. Hair hy hair, heads get hald; etraw hy straw the thatch goes off the cottage; and drop by drop, the rain comee in the chamher. A harrel is soon empty, if the tap leaks but a drop a minute. When you mean to eave, hegin with your mouth; there are many thieves down the red lane. The ale jug is a great waste. In all other things keep within compass. Never stretch your legs farther than the hlankets will reach, or you will soon he cold. In clothes, choose euitahle and lasting stuff, and not tawdry fineries. To he warm is the main thing; never mind the looks. A fool may make money, hut it needs a wise man to spend it. Remember it is easier to huild two chimneys than to keep one going. If you give all to back and board, there is nothing left for the savings-bank. Fare hard and work hard while you are young, and you will have a chauce to rest when you are old.

A Retired Baker's Receipt eor Bread. Take an earthen vessel larger at the top than at the hottom, put in one pint of warm water, one and a half pouuds of flour, and a half pint malt yeast; mix well together and set away in a warm place until it raisee and falls again, which will be in from three to five houre. Then put two large spoonfuls of salt into two quarts of water and mix with the above rising; then put in ahout nine pounds of flour aud work it well; let it rise until night; then make it into loaves. New and runny flour requires one-fourth more salt than old and dry flour. Bake as soon as light.

Preserved Meats.

The Victoria Meat Preserving Company (Limited), of Melbourne, hae succeeded in overcoming the difficulty which has hitherto heen experienced in importing uncooked meat from the coloniee to this country in euch a state as to render it both wholesome and palatable food. Their process is very simple. The meat is first slightly corned, theu packed in a tin case, after which melted fat is poured over it, and, the interstices heing filled up, a tin lid is soldered down—thus effectually excluding air and preventing decomposition. The cooked meats of the same company are also particularly worthy of commendation. A prejudice has been long existent against Australian preserved meats—aud not altogether without reason, for hitherto they have heen eodden and "done to rags;" hut we are enahled to testify that the samples now supplied are not overdone, and consequently retain all the nutritious properties of freshly-cooked meat, and are equally agreeahle to the eye as they are grateful to the palate. The fat (by which, as a rule, meat may he fairly judged) is not melted into tallow, as is usually the case, hut is sweet and good; whilst the jelly within hespeaks the quality of the flesh which it surrounds. The meat ie packed in various couvenient-eized tins, aud is supplied to the trade at a cheap rate. Taking into consideration that the meats are boneless and already cooked, consumere are enahled to effect a eaving of nearly 50 per cent. as againsted hutcher's meat, and with this inducement to purchasers, a little effort on the part of retailers is all that is required to remove the objection to this class of food, and not only would the puhlic be supplied with a most wholesome article of diet, hut a profitable trade might also be firmly established.

To Make Bread From Flour that Runs. Put what flour you need in your pan, and pour enough boiling water over to just wet all of it, but not to make it thin; sprinkle in a teaspoonful of salt and a epoonful of hutter; stir it up with a large wooden spoou until eure that all the flour is scalded; then cover, and let it stand till cool enough to add the yeast. So that the yeast is sweet and lively, you can uee any kind you prefer—hakere' or home-made. When the flour ie eufficiently cool clear to the bottom add your yeast, and give the whole mass a faithful kneading, adding more tepid milk or water, if needed. Knead till the dough cleane from your hands easily; then eet to rise. When very light, knead again, put into the pane, and leave it to riee once more; then bake as directed above. By this method "running" flour can often he conqnered, and bread thus scalded will be found uncommonly sweet and tender.

Bean Soup.—With all thy dinner getting get soup. Get into the hahit of having it. Soup ie to a dinner what an anthem is to a divine service. It ie not half the trouhle that inexperienced housekeepers imagine it may he. Only a little is required on which to begin a dinner. When once in the way of having it, regularly, you will appreciate the convenience of soup stock, and value it equally with prepared fruits. To make bean eonp, clean the heane over night, pour boiling water over them and let them stand until morning. Then place in plenty of fresh water and put over the fire; add a small piece of corned heef with half as much pork; cover tight and skim as needed. When the heans are partially cooked, add sliced carrot, parsley, celery and pepper; boil elowly until done; strain into tureen and cover.—*Moore's Rural.*

Cautionary.—We ehould let our water pipes run a minute before we take water to drink, or use for cooking in the morning; and in going into a new house, or into one in which water pipes have heen just placed, it is hetter not to use the water for drinking or cooking for at least a month. And on returning home after eome weeke' ahsence, in summer excursions or for other reasons, take the same precautions. Perhaps in these things we find the reason of some persons eickening and dying just after getting into new houses.

Raised Crust for Pies.—Some persons cannot eat rich paetry, and for their benefit I will give a plain recipe. Take one pound of flour, three ounces of butter, one tableepoonful good yeast, and milk to form a dough. Rub the butter in flour, add the milk and yeast, and set to rise. When light, roll out pretty thin, and line the plates. Put in the fruit, roll out the cover, and set the pies in a quick oven. This makes a good crust.

Good Advice.

Many good people are much troubled hy the multiplicity of duties, especially in household matters. They see so much to he done, that they are ever in a worry and hurry, and thus are in danger of doing nothing well, and also leaving many things undone. In their eagerness to do the great things of their calling, they are apt to overlook what seems to he the smaller concerns, which perhaps lie just at hand. They are looking ahead and aloft, and pass over what really ought to he attended to, and which, if attended to and thus put out of the way, would lead on naturally and quietly to greater works. These little things may be indispensahle to the accomplishment of the greater. They may be the little stones which together make up the building. They may be the first rounds of the ladder, leading up to loftier hights of achievment.

Now let such persons consider what the great German poet, Goethe, eaid—and he hardly uttered a wiser one—"*Do the thing that lies next you.*" Be it little, do it. It may be great in its necessary relation to something else. Neglect not the preeeut, the immediate thing. The person who adopts this rule will do a world of work—a world of good. He will hegin at home, in his little circle, and so branch out as each day gives uew and, perhaps, wider opportunities.

Chicken Jelly.—For chicken jelly, take a little chicken, cut it up into emall pieces; hruise the bones and put the whole into a stone jar, with a cover that will make it water-tight. Set the jar in a large kettle of boiliug water, and keep it hoiling for three hours. Then strain off the liquid, and season it slightly with ealt, pepper and mace, or with loaf sugar and lemon juice, according to the taste of the person for whom it was intended. Return the fragments of the chicken to the jar, and eet it again in a kettle of boiling water. You will find that you can collect nearly as much jelly by the eecond hoiling. This jelly may be made of an old fowl.

To Kill Lice.—In every issue some one is inquiring how to kill lice. Having had six or eight years' experience with lice on human as well as hrute creation, I find nothing like salt. Wash horses, colts, cows or calves with a hrine ae strong as it can be made. It ie a dead sure shot.—P. Green, Bath, N. Y.

Mechanical Hints.

How to Use Grindstones.

1st.—Don't waste the stone hy running it in water; hut if you do, don't allow it to etand in water when not in uee, as thie will cause a eoft place.

2d.—Wet the stone hy dripping water on it from a pot suspended ahove the etone, and etop off the water when not in use.

3d.—Don't allow the etone to get out of order, but keep it perfectly round by use of gas pipe, or a hacker.

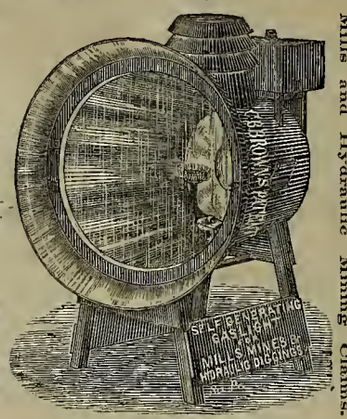
4th.—Clean off all greasy tools hefore sharpening, as grease or oil destroye the grit.

5th.—Observe: When you get a stone that suite your purpose, eend a eample of the grit to the dealer to select by; a half ounce eample is enough, and can be sent in a letter hy mail.—*Franklin Journal.*

Brown Tint for Iron and Steel.—Dissolve in four parts of water, two parts of crystallized chlorine of iron, two parts of chloride of antimony and one part of gallic acid, and apply the eolution with a eponge or cloth to the article, and dry it in the air. Repeat this any number of times, according to the depth of color which it is desired to produce. Wash with water and dry, and finally rub the article over with hoiled linseed oil. The material thns receivee a brown tint and reeists moisture. The chloride of antimony should he as little acid as possible.

To Draw a Curve.—A plan hut little known among draughtsmen, and most efficient for drawing fair curves, is the following: Cut a strip of soft pewter similar to that used for covering bar counters, ahout one-sixteenth of an inch thick, and from one-eighteenth to three-sixteenths of an inch wide, the length of the longest curve required. Dress it straight, and smooth the edges with a file. By drawing the etrip through the closed fingers of the left hand, or over the thumb, a very regular curve may be obtained, which can be altered at will till it matches the line to be drawn or copied. For fiue or quick curves a slighter strip should be used.—*Cabinet Maker.*

BROWN'S PATENT LAMP, FOR Mills and Hydraulic Mining Claims.



One of theee Lampe, when placed at a distance of 200 feet from the hank, will light up a hank surface 250 feet in length and 100 feet high, and to a much better advantage then any other light heretofore tried, and at an expense not to exceed five cents per hour. Lamps furnished at short notice.

The California Powder Works

No. 314 CALIFORNIA STREET,
SAN FRANCISOO.

Manufacturers and have conetantly on hand

SPORTING,
MINING,
And BLASTING
POWDER,

Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It heing constantly received and transported into the interior, ie delivered to the conenmer within a few daye of the time of its manufacture, and is in every wey superior to any other Powder in Market.

We have been awarded euccessively

Three Gold Medals

By the MEOHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the euperiority of our products over all othere.

We also call attention to our

HERCULES POWDER,

Which combines all the force of other strong explosive now in use, and the lifting force of the BEST BLASTIN POWDER, thue making it vaetly superior to any other pompound uow in use.

A circular conteining a full deecription of thie Powder can be obtained on application to our Office.

16v20-3m JOHN F. LOHSE, Secretary.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating oree, they have no equal. No effort has heen, or will be epared, to have them conetructed in the most perfect manner, and of the great number now in operation, not one hea ever required repairs. The constant and increasing demand for them iecufficient evidence of their merits.

They are constructed so ae to apply steam directly into the pulp, or with steam hottome, ae deeired.

This Amalgamator Operates as Follows:

The pan heing filled, the motion of the muller forcee the pul, to the center, where it ie drawn down through the apperture and hetween the grinding eurfacee.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference ae hefore. Thus it is constantly passing a regular flow hetween the grinding surfacee and into the quicksilver, until the ore ie reduced to an impalpahle powder, and the metal amalgamated.

Setlers made on the eame principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorhed.

Mill-men are invited to examine theee pans and eetlers for themselvee, at the office, 229 Fremont Street, San Francisco.

AMBLER'S BLOWPIPE FURNACE,

For Roasting Rebellious Ores.

This new roasting furnace ie the CHEAPEST AND BEST yet offered to the public. By furnishing an emple eupply of oxygen to the ore while roasting, thorough oxydization of the sulphurete ie eecured at a emall coet.

It is Adapted to All Kinds of Ores.

A description and illustration of thie Furnace wae given in the SCIENTIFIC PRESS of November 25th.

For terms, circular, and further information, addrees the agent of the inventor,

CRAIG & BREVOORT'S
Patent Condenser for Steam
PUMPS, &c.

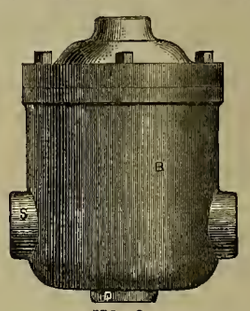
NO. 1.

The annexed engravings represent a Condenser intended to be attached to the ordinary steam pump, thereby bringing it within the class of low pressure, or more properly speaking, of condensing engines; the steam, when it has done its work in the cylinder, instead of being exhausted into the atmosphere, is conducted to the condenser, on its entry into which, it meets the water drawn by the pump, and is immediately condensed.

The Cut No. 1 represents a vertical section of the Condenser, and No. 2 an elevation.

The flange D is bolted to the suction orifice of the pump, and the flange S to the pipe leading to the well, or whatever source of supply the pump may have; W is a water jacket surrounding the main chamber of the condenser, B, and with which the suction pipe, S, communicates, permitting a free circulation of water within the jacket and into the hollow cover or top through the series of openings, one of which is shown at A, and from thence into the body of Condenser, B, through pipe P, carried by float F; the pipe P also acts automatically as a valve to enlarge or contract the space through which the water enters it, by which means the possibility of the condenser being at any time flooded is avoided. The pipe P, it will be observed, also acts as guide to float F.

The valve, O, (shown in Cut No. 1), which is raised or lowered by means of screwed stem—shown coming through elbow in Cut No. 2—is for the purpose of increasing or decreasing the flow of water according to the capacity of the pump to which it is attached.



NO. 2.

The exhaust pipe from steam cylinder is screwed into cover at E; the exhaust steam is thus thrown directly into contact with the water entering the condenser on its way to water cylinder of pump through D. A vacuum being of course immediately formed, acts on the exhaust side of the steam piston, aiding it in its work. If at any time it is desirable to run the pump without the condenser, it is only necessary to turn the three-way cock, which is placed in the exhaust pipe, into such a position as to cause the steam cylinder to exhaust into the atmosphere; when this is done the pump is perfectly free from the condenser, and acts as if it were not attached. This condenser is specially useful for pumps running in mines, or any other position where trouble is experienced in getting rid of the exhaust steam. Address H. L. BREVOORT,
6v23eowly 128 Broadway, New York City.

Phœnixville Bridge Works

DR. LIVINGSTONE.—The Council of the Royal Geographical Society have undertaken, with the assent of Her Majesty's Government, though not with its immediate official assistance, the "Livingstone Search and Relief Expedition." They propose to send a steamer to Zanzibar and proceed, according to the advice they may receive there, to try and find some tidings of the lost explorer. The expedition will prosecute the search until something definite concerning his fate is learned.

Mining Companies

Should advertise their Meetings, Assessments, and Sales, in the SCIENTIFIC PRESS. Rates more than one-half less than daily publications. Stockholders should take the hint and request their managers to truly economize by advertising in a MINING JOURNAL, where all notices may be seen by cheaply purchasing and examining a weekly. You will thus save money and uphold a journal which upholds your interests

RICHARD H. BUEL, Consulting Mechanical Engineer, 7 Warren Street, New York. Advice and assistance given to those who desire to invest funds in meritorious and valuable Patent Rights. Machinery of all kinds bought and sold. Unusual facilities for testing engines, boilers and other machinery. I refer particularly to Professor R. H. Thurston, of the Stevens Institute of Technology, who has consented to associate himself with me in consultation on matters of special importance. 10v24-13t

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

J. R. ANDREWS,

SUCCESSOR TO

F. MANSELL & CO.,

House and Sign Painters,

412 PINE STREET, SAN FRANCISCO,

Three doors above Montgomery st.

F. MANSELL still superintends the Fancy and Ornamental Sign Work.

Country Orders Attended to

With Punctuality, Cheapness and Dispatch.

TO QUARTZ MINERS AND MILLMEN.

Three years since we established in connection with our Crockery and Silver Plated Ware Business, a Factory for Silver Plating by electro process all wares which we had previously imported ready plated from Eastern factories.

Our enterprise, assisted by the liberal patronage of the Builders and Plumbers, has proven a success; and having subsequently added to our business that of SILVER PLATING COPPER PLATES for AMALGAMATING PURPOSES, we desire to inform the Miners and Millmen of California and Nevada, that we have recently perfected such improvements as to enable us to furnish at very short notice Silver-plated Amalgamating Plates, having a smoothness and finish of surface never before attained in California.

Orders for special sizes sent by mail will receive prompt attention. References from those who have used our Plates will be furnished to those desiring them

Qualitative and Quantative Analysis

—WITH—

THE BLOW PIPE,

From the last German edition, Revised and Enlarged,

BY PROF. TH. RIOHTER,

Of the Royal Saxon Mining Academy.

Translated by

PROF. HENRY B. CORNWALL,

Assistant in the Columbia School of Mines, New York, assisted by JOHN H. CASWELL.

Illustrated with Eighty-seven Wood Cuts and one Lithographic Plate.

One vol., 8 vo., 660 pages, cloth, $7.60.

Plattner's celebrated work has long been recognized as the only complete hook on Blow Pipe Analysis. The fourth German edition, edited hy Prof. Richter, fully sustains reputation the earlier editions acquired during the lifetime of the author, and it is a source of great satisfaction to us to know that Prof. Richter has co-operated with the translator, in issuing the American edition of the work, whicb is in fact a fifth edition of tbe original work, being far more complete than tbe last German edition.

The American editor, Mr. Cornwall, has done a very great service for all students of chemistry and mineralogy who use tbe English tonguo, in thus adding to our scientific literature a work of such rare merit. He has shown excellent judgment in rendering the work into good English, in avoiding needless repetitions, in adding a large amount of valuable material, and in adopting a mineralogical nomenclature which is familiar to American scientific men.—*Silliman's Journal.*

D. VAN NOSTRAND, Publisher,

23 Murray street and 27 Warren street, New York.

Copies sent free hy mail on receipt of price.

☞ My new Catalogue of American and Foreign Scientific Books, 80 pages, 8vo., sent to any address on receipt of 10 cents. mar16-1t

AMERICAN JOURNAL OF SCIENCE

(Founded by Professor Silliman in 1818) ended its 1st Series of 50 volumes as a quarterly, in 1845, and its 2d Series of 50 volumes, as a two-monthly, in 1870. A Third Series in MONTHLY numbers commenced January, 1871.

Devoted to Chemistry, Physics, Geology, Mineralogy, Natural History, Astronomy, Meteorology, etc. Two volumes, of over 440 pages each, published annually.

Editors and Proprietors: Professors Dana and Silliman. Associate Editors: Professors Gray and Gibbs of Cambridge, and Newton, Johnson, Brush and Verrill of Yale.

Subscription price $6 a year, or 50 cents a number. A few complete sets on sale of the first and second series.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the Scientific Press we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Shareholders' Meeting — Office of the

Eagle Quicksilver Mining Company.

In accordance with a resolution adopted at a meeting of the Trustees of the Eagle Quicksilver Mining Company, duly held on the 15th day of March, 1872, a special meeting of the stockholders of said company is hereby called, to be held at the office of the company, Room No. 5, No. 30: Montgomery street, San Francisco, California, on Monday, the 25th day of March, 1872, at the hour of 4 o'clock P.M. of said day, to elect two Trustees to fill vacancies in the Board, and for the transaction of such other business as may lawfully come before it.

WM. H. WATSON, Secretary.

San Francisco, March 16th, 1872. mar16-2t

Kincaid Flat Mining Company—Location

of works, Tuolumne County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 11th day of February, 1872, an assessment of three dollars per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Sec'y, at his office, No. 220 Clay street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 18th day of March, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 8th day of April, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

R. H. CORNELL, Secretary.

Office, 220 Clay street, San Francisco. fe24-td

Marcelina Silver Mining Company.—Lo-

cation of Works: Eureka District, Lander County, Nevada.

Notice is hereby given that at a meeting of the Board of Trustees of said company held on the eighth day of March, 1872, an assessment of ten cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, Room 21, Hayward's Building, 419 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the fifteenth day of April, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the seventh day of May, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

CHAS. E. ELLIOTT, Secretary.

Office, Room 21, Hayward's Building, 419 California street, San Francisco, California. mar19-3w

Nuestra Senora de Guadelupe Silver Min-

ing Company.—Location of Works: Tayoltita, San Dimas District, Durango, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twelfth day of May, 1869, an assessment of two dollars per share was levied upon the assessable capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, E. J. Pfeiffer, No. 210 Post street, or to the Treasurer, A. Himmelmann, No. 637 Washington street, San Francisco, to settle the indebtedness of the said Company.

And whereas there has been an error in the course of proceedings for the collection of said Assessment, by reason of which, as provided by law, all previous proceedings, except the levying of the Assessment, are void, and publication required to be begun anew, NOW, therefore, by order of the Board of Trustees of said Company, at a meeting of said Trustees, held on the eighth day of March, 1872, said Assessment is hereby re-published, and notice thereof given as follows, to wit:

Nuestra Senora de Guadelupe Silver Min-

ing Company.—Location of Works: Tayoltita, San Dimas District, Durango, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twelfth day of May, 1869, an assessment of two dollars per share was levied upon the assessable capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, E. J. Pfeiffer, No. 210 Post street, or to the Treasurer, A. Himmelmann, No. 637 Washington street, San Francisco, to settle the indebtedness of the said Company.

Any stock upon which said assessment shall remain unpaid on the fifteenth day of April, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the eighth day of May, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

E. J. PFEIFFER, Secretary.

Office, No. 210 Post street, San Francisco, California.

Piermont Milling and Mining Company—

Location of works, Piermont District, White Pine county, Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 25th day of January, 1872, the several amounts set opposite the names of the respective shareholders, as follows:

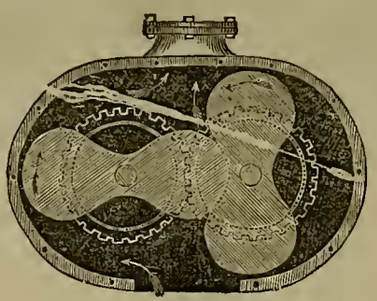
ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

MANUFACTURED AT

The Globe Iron Works, Stockton, Cal.

AWARDED THE FIRST PREMIUM AT THE PARIS EXPOSITION—PATENTED NOV. 1, 1864; JULY 24, 1866; AND OCT. 9, 1866.

Adapted for Smelting, Foundry, Mining and Steamships.



Requires 50 Per Cent. LESS POWER Than any Blower Now in Use.

One of these Blowers may be seen at W. T. Garratt & Co.'s Brass Foundry, San Francisco; Gould & Curry and Savage S. M. Co.'s, Nevada; and at O. P. R. R. Co.'s Works, Sacramento; and other places on this coast.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

QUARTZ, SAW AND GRIST MILL, IRON, STATIONARY AND STEAMBOAT ENGINES, HORSE-POWER AND PUMPS, OF ALL SIZES.

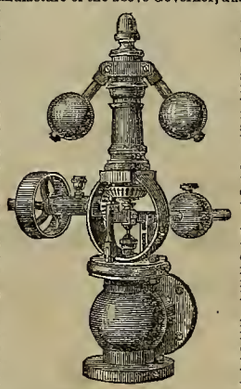
THE GARDNER AUTOMATIC SAFETY-STOP GOVERNOR.

These Governors have now been sold in this market for several years, and wherever once introduced and made known, are invariably sought after. They are in the Eastern States fast displacing all other Steam Governors, and are regarded as *the perfect regulator*. They are manufactured by Messrs. Gorchur & Robertson, practical engineers, who have given many years time exclusively to their manufacture and perfection. The manufacturers say: After an experience of eleven years in the manufacture of the above Governor, during which time several important improvements have been made and two additional patents obtained, we feel justified in recommending it to all parties using Steam power, and warranting it to be the most perfect regulator in the market.



The Gardner Governor is so well known that we think it unnecessary to enter into a detailed explanation of the principles involved, or details in its construction, merely giving the leading objects realized by this important invention. The Governor combines with the greatest simplicity of construction, accurate regulation of speed, POSITIVE INSURANCE AGAINST ALL ACCIDENTS LIABLE TO OCCUR FROM SLIPPING OR PARTING THE GOVERNOR OR DRIVING BELTS, and a convenient arrangement for ADJUSTING THE SPEED OF THE ENGINE WHILE IN MOTION, without change of pullies.

The construction of the Governor is extremely simple, having no springe, inside joints, swivels, or parts liable to disarrangement, all the several parts are duplicates of each other in the same series; the most skillful workmen are employed, the best material used and the machinery employed especially adapted to their manufacture. The valve is most PERFECTLY BALANCED, and the Governor is built with a view of securing the quickest and most sensitive action possibly attainable in a steam regulator. Thus with accurate machinery, and skilled labor, and devoting our WHOLE ATTENTION to the manufacture of THIS ONE ARTICLE, we are able to produce a perfect and reliable Governor at a low price.

We do not publish any letters of recommendations, but can give references to upwards of 5,000 PARTIES THROUGHOUT THE UNITED STATES, who are using the Gardner Governor.

We would especially invite the attention of steam Engine Builders to this Governor, feeling assured that they can purchase for less than they can make an inferior article, and thereby increase the value and sales of their Engines.

We respectfully refer to the following parties using the GARDNER GOVERNOR, and can speak understandingly of its merits: Oakland Cotton Mills, the Selby Lead and Silver Smelting Works, L. & E. Emanuel, Vulcan Iron Works, Fulton Foundry, Levison Bros., Cal. Jewelry Co., Pioneer Woolen Factory, D. A. McDonald & Co., and others in San Francisco; Ophir Co., Lady Bryan, and Sacramento and Meredith Mills, John McCone, Virginia, Nev.; Globe Iron Works, Stockton; A. F. Chury, Albany, Oregon, and many others.

☞ WE WARRANT these Governors to give perfect regulation of speed under all circumstances; and if there is one within one thousand miles of San Francisco, that is not giving perfect satisfaction, it may be returned to us at our expense, and we will exchange it for any other Governor in the country, or refund its price.

☞ When ordering please state whether THROTTLE-VALVE is wanted or not; and whether BLOCK or FINISHED Governor is desired. **THE RATE OF SPEED FOR GOVERNOR IS FULLY STAMPED ON THE REVOLVING HEAD OF EVERY GOVERNOR. Send for circular and price list to

TREADWELL & CO.,

Agents for Pacific States, San Francisco.

COPARTNERSHIP NOTICE.

We have this day admitted Mr. William R. Eckart as a member of our firm, the business of which will be hereafter conducted under the firm name of Prescott, Scheidel & Co. PRESCOTT & SCHEIDEL.

Marysville, Jan. 8, 1872.

MARYSVILLE FOUNDRY.

Referring to the above, we respectfully solicit the patronage which has for the past twenty years been enjoyed by our predeceseors, pledging our best attention to the wants of all who may so favor us.

Quartz and Amalgamating Machinery,

SAW AND GRIST MILLS,
STEAM ENGINES,
HYDRAULIC MACHINES,
HOUSE FRONTS, ETC.

Repairs upon all kinds of machinery promptly made and at moderate chargee. Having unrivalled facilities, we are prepared to make to order, at short notice, everything required in our line.

Specimens of our work may bo seen in all the mining regions on this coast.

5v24-3m PRESCOTT, SCHEIDEL & CO.

THE RISDON
Iron and Locomotive Works.

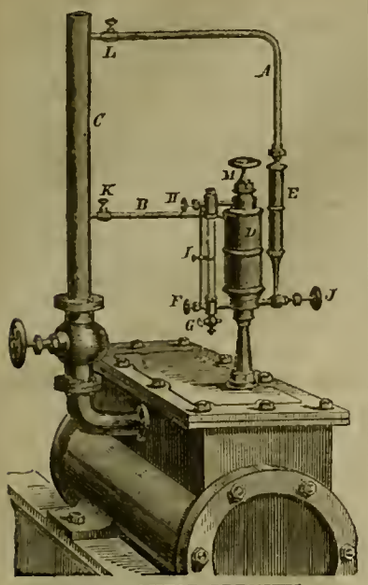
J. H. WEED V. KINGWELL.

N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

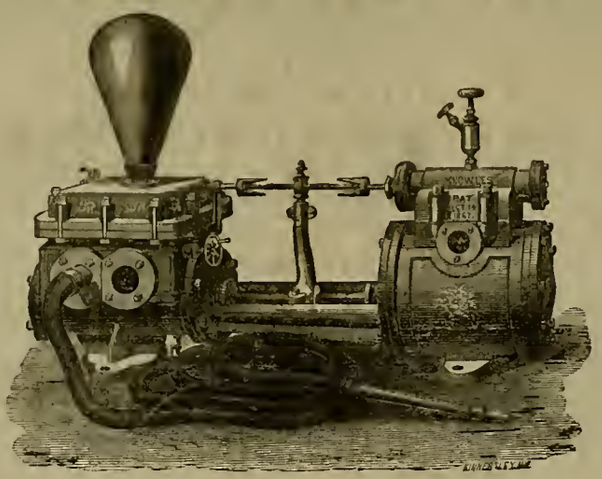
KNOWLES' PATENT STEAM PUMP.

Received the Highest Award---A Diploma---

Over all Steam Pump Competitors, at Mechanics' Institute Fair of San Francisco, 1871; also Special Medal and Diploma at State Fair.



It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.

The trial of Steam Pumps at the Eighth Industrial Fair in San Francisco, by a Committee of Five of the most thoroughly practical mechanics on this coast, showed the Knowles Pump to lose but 11½ per cent., while others lost as high as 40 per cent., showing great difference in economy.

CENTRAL PACIFIC R. R., OFFICE OF THE GEN'L MASTER MECHANIC,
SACRAMENTO, Cal., April 14, 1871.

A. L. FISH, Esq., Agent of the Knowles' Steam Pump, San Francisco—Dear Sir: In reply to your inquiry as to the merits of the Knowles' Steam Pump, in use upon this road, I will say that we have nineteen of them in use on this road as fire engines, and pumping water for shop and station use. I consider the Knowles Steam Pump the best in use, and prefer it to any other. Yours truly, A. J. STEVENS, General Master Mechanic.

WE BUILD AND HAVE CONSTANTLY ON HAND

THE LARGEST STOCK OF PUMPS IN THE WORLD,

And for Every Conceivable Purpose.

A. L. FISH, Agent.

Black Oxide Manganese, Sodium and Sodium Amalgam, Sulphate of Copper, Quicksilver, and all Chemicals and Reagents required by Assayers and Milling Co.'s.

☞ Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in Grains and Grammes, will be sent upon application.

24v23-tf JOHN TAYLOR & CO.

The Scientific Press is the Oldest and Largest Practical Mining Journal in America.

Established in 1860, this weekly has steadily advanced in size, ability and interest. Its chief editors and publishers have had over fifteen years successful experience in conducting this and other journals in California.

Its editorials are carefully prepared with an honesty and accuracy that maintains its reputation as the best authority on mining matters in the country.

It is published in the best location in the world for furnishing the largest amount of valuable information to the gold and silver miners and metallurgists everywhere.

Its correspondents and subscribers are to be found in nearly all the mining districts of CALIFORNIA, NEVADA, IDAHO, MONTANA, UTAH, ARIZONA, COLORADO, and in MEXICO and other foreign countries.

Over 10,000,000 Dollars!

Have doubtless been saved to the miners of the Pacific Coast by reading this journal, each issue of which contains some two pages of MINING SUMMARY from the most important districts in the U. S.; from one to two pages concerning NEW INCORPORATIONS, SHARE MARKET, MINING CORRESPONDENCE, COMMUNICATIONS, etc., and from two to three pages of EDITORIALS (with illustrations) of NEW MACHINERY, NEW DISCOVERIES, PROCESSES, and operations in MINING, MILLING, ROASTING of ORES, ASSAYING, etc.

One feature of our journal consists in presenting in each issue a POPULAR VARIETY of highly interesting matter, useful and instructive for all intelligent readers, systematically arranged in departments under headings entitled Mechanical Progress; Scientific Progress; Mechanical Hints; Home Industry; New Discoveries; Good Health; Domestic Economy, etc., rendering its reading pleasant and profitable at the OFFICE, SHOP AND FIRESIDE.

Yearly subscription $4 per annum. Single copies 10 cents. Four sample copies (of recent dates) furnished for 25 cents. List of California mining books sent free. DEWEY & CO., Publishers, Patent Agents and Engravers, No. 338 Montgomery street, San Francisco.

THE PAUL PROCESS.

WONDERFUL RESULTS
—BY—
Practical Working.

OVER $1,000 DIFFERENCE IN TWENTY-TWO TONS OF ORE.

The Tailings of 20 Tons of Ore, Worked in Pans, and Netting $8.14 per Ton, Yielded by this Process $293.27!

BASE ORES WORKED, AND BULLION FROM 960 TO 999-1000 FINE.

OTHER MILLS ORDERED.

A Revolution in Milling Ores.

READ THE FOLLOWING STATEMENTS:

DUN GLEN, March, 1872.

MR. ALMARIN B. PAUL—SIR:—Yours asking for statement of tests made at Sprague & Co.'s new mill at this place is received, and we here cheerfully oomply as follows: We reduced 22 tons of ore from the Anburn mine, owned hy Messrs. Wright & Wentworth, containing besides Gold and Silver, Magnetic Iron, Carbonate Oxide, and Sulphuret of Lead. The 22 tons worked by your process, paid $107 per ton. Eleven tons of same ore worked in pans, paid $53 per ton. The hullion from your process runs as high as 989–1000 fine.

We also worked the tailings of a lot of 20 tons of ore from the Monroe Mine, which ore in the first instance was reduced hy battery and pan process, at Essex Mill, and paid $8.14 per ton. The tailings from this lot yielded by your process, $293.27. The hullion per battery and pan working, was 584 fine; by your process as per certificates of San Francisco Assaying and Refining Works, was 960 fine. The loss of mercury was less than half a pound per ton.

We also made a test on a small lot of Iron Sulphurets from Monroe Mine, very closely concentrated, and which had been previously worked by battery and pan amalgamation, and which had been salted, oxidized, and worked several times previously—each time yielding some low grade bullion. This lot was treated hy your process, and to our astonishment ohtained more metal in value, than we had gained hy all the several previous working, though very carefully done. The bullion hy last working, as per certificate of California Assay office, was 999–1000 fine.

We have now commenced on the "Lang Syne" ore, from a mine belonging to the "Great Central Mining Co. of San Francisco," the results of which speak more for your process, and the great revolution the system is likely to inaugurate, and of its inestimable value, than any tests we can give you. That you may fully understand this we must particularize.

In 1863–4–5, the Lang Syne mine was worked, and in 1864 a mill erected for reduction of its ores, and over $100,000.00 expended and lost. The ore could not be made to pay.

The operation was pronounced a failnre, and the mill removed. Tests of ten and twenty tons were also worked at the Essex Mill, having all the then modern improvements, with like unsatisfactory results. The mill just erected for the working of your Process is built upon the same spot where the old mill stood. We have now worked a number of tons of a class of ore of which there are hundreds of tons in sight, with the result of $30 per ton, and bullion 966 fine—heing more than double the result ohtained in other mills.

The same renewed life which this locality has received through the introduction of your radically improved system, we are certain can be extended to others similarly situated, hy the introdnction of your mills.

We will add that we have no difficulty in saving the mercury, and assert that the loss on all ores can be hrought within that of pan amalgamation, and ordinarily very considerahly less. Under all circumstances, it is hright, active and pure, and is used over and over again without any cleansing or retorting.

Your self-feeding and self-discharging Pulverizing Barrel is, without exception, one of the most complete reducers that we have ever seen. Its capacity is fully equal to your estimates of it, receiving ore from No. 14 wire cloth.

The pulverizing of ore hy quartz, instead of iron, is not only cheaper but mnch better.

If desirable, we will, at any time, give results of our working.

Yours, SPRAGUE & CO.

CHAS. D. SMYTH,
Sup't. of Sprague & Co's. Mill, also Great Central M. Co's. Mines.

As corroborative testimony, the following from the owners of the Auburn Mine speaks for itself.

DUN GLEN, Humboldt Co., Nevada.

MR. ALMARIN B. PAUL—Dear Sir:—As we have completed the working at Sprague & Co's. Mill of the ore from our mine, by your Electro-Chemical Dry Amalgamating Process, we are prepared to give its comparative merits with our old system of working in pans. We had eleven tons of ore worked at the Essex Mill hy Pan Process. The returns were $53 per ton, with bullion heavily charged with base metals. The quantity worked hy yonr Process was twenty-two tons, and the returns $107 per ton, with bullion as high as 989–1000 fine U. S. Mint assay. All the ore was from the same mine, and the first extracted. It contained, with the precious metals, Sulphuret, Carbonate and Oxide of lead, some zinc.

Your Process we regard as cheap, simple and practical, and are satisfied it can work ore to a much higher percentage than pans, and produce fine hnllion; in fact, we believe it to be one of the greatest improvements in Quartz Mining of the age.

Respectfully yours,
JOHN WENTWORTH
JOHN WRIGHT.

We, the undersigned, Quartz Mill Builders of Humboldt County, Nevada, having examined the mechanical construction of the machinery which make np the "Paul Process," at Sprague & Co's. new mill, Dun Glen, give it as our opinion, that the same is mechanical in design, simple in construction, and practical in operation.

JAS. G. HUTTON.
J. S. O'DONNELL.
P. W. CUNNINGHAM.

This Process GATHERS THE FLOUR GOLD as easily as the coarser, and will WORK SILVER ORES to a higher percentage than any system of raw amalgamation. It is cheap, and requires no scientific labor to work it. Pamphlets forwarded free of expense on receipt of address. For further particulars apply to

SCIENTIFIC PRESS.

AN ILLUSTRATED JOURNAL OF SCIENTIFIC AND INDUSTRIAL PROGRESS,

Mining, Mechanic Arts and Inventions.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, MARCH 23, 1872.

VOLUME XXIV. Number 12.

Pelton's Improved Horse-Power.

Our illustration represents an improved horse-power which combines strength, compactness, a large wearing surface and consequent durability. It consists of two sets of triple gears, one arranged above the other, both of them driven by the same master-wheel. A case or boxing of novel construction and application covers the gearing or moving parts, which protects the power from dust and foreign bodies and men from danger of accident.

A represents the bed-frame upon which the horse-power is secured. The annular metal base plate is properly secured upon the frame *A*, and has a raised outer rim or vertical flange, *C*, which is formed into alternate raises and depressions, making the lower half or section of a circular box. The double set of triple gears are arranged inside of this section of the box, the two sets being arranged in alternation, and each of the six-toothed wheels engaging with the centre pinion which is made with a sufficent face to admit the engagement of both sets of triple gears. The horizontal bevel wheel is driven by the centre pinion being socured to the lower end of the same shaft, and it in turn drives the tumbling-rod. *N* is the upper half of the circular case, inside of which the train of gears is placed, and it is arranged with a downward projecting flange, *O*, which is also provided with alternate raises and depressions corresponding to those on the lower half, so that when the two flanges are placed together the projections will interlock and form a snugly-fitting side to the case, so as to resist the torsion conseqnent on the application of the power. The upper section of the box, *N*, is also annular, and recesses are made in the proper position around its inner edge, through which the pinions pass, so as to stand above the upper face of the upper section, *N*.

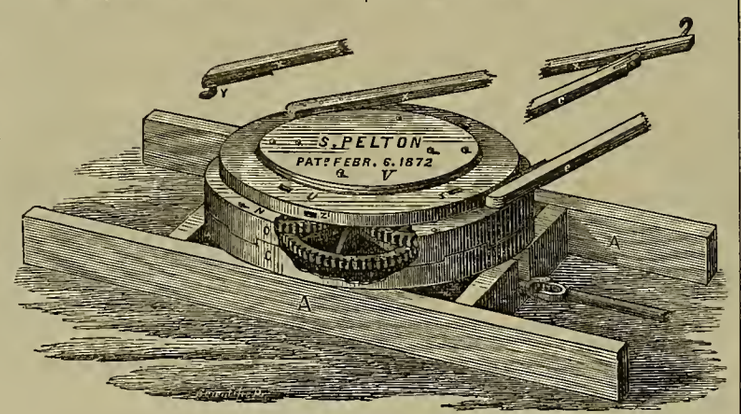
A raised ring is secured around the inner edge and above the circular opening in the upper section, *N*, being secured to it by flanges which project downward so as to leave sufficient space above the recess to allow the master-pinions to project above the case or box. The journals on the upper end of the vertical shafts which carry the double set of triple gears, hear and are supported in the holes in this ring, while the journal of the shaft which carries the center pinion hears in the cross bar below. The master-wheel, *U*, is an annular one with internal gears. In order to protect the gearing inside of the box, a cap or cover, *V*, is secured upon the raised ring, thus entirely concealing the operating parts, and preventing the master-wheel from being lifted or displaced hy any means.

The four levers, *x*, to which the horses are attached, are secured to the master-wheel by means of a hook or curved bar, *Y*, which is secured to the end of each lever so that the hook shall extend beyond the end and in a line with the lever. Holes or slots, *z*, are made through the upper face of the master-wheel, parallel with its rim, and the hooks, *Y*, inserted hy elevating the outer end of the lever until the end of the hook enters the slot, *z*. The lever when depressed will then he supported upon the master-wheel hy the binding of the hooks upon the under side of the wheel. The braces, *e*, are provided at one end with a similar hook which is inserted into the slots, *z'*, in the vertical rim of the annular master-wheel in the same manner as that of the levers. The outer extremity of the braces, *e*, are secured to the levers near their outer ends hy a loose joint.

By this manner of arranging and applying the triple gears, a large amount of wearing surface is secured, and the strain is distributed more evenly, thus insuring durability and strength, while the entire machine is at the same time in a compact and convenient form.

The arrangement of the box or inclosing case is at once economical and convenient. While it not only protects the gearing itself from injury, it completely obviates any liability of accident to life or limb, which the ordinary open horse-power is apt to occasion. It also excludes dust and dirt from the machinery, so that it will not be necessary to be continually cleaning the journals from the accumulation of gummy or other matter, thus saving oil and time, while the machine will run much easier on account of its keeping clean.

The device for attaching the levers and braces is especially useful, as it will allow of all neccessary changes in the elevation of the outer extremities of the levers, without in any way affecting the attachment; while it at the same time provides a strong, simple and convenient means of attaching these pieces to the horse-power. Owing to the extended surface of the journals the power only needs oiling once a day. The construction of this power is such that, as will be evident to any one familiar with this class of machines, from 25 to 50 per cent. more power can be gained with the same steam than any other horse-power will furnish, and it will take at least 30 days' use in driving a threshing machine to get the master piston cogs bright and smooth, owing to the great extent of hearing surface. This invention was patented through the SCIENTIFIC PRESS Agency hy Samuel Pelton, of Marysville, Cal., who may be addressed at that place for further information.



PELTON'S IMPROVED HORSE-POWER.

The Mining Incorporation Bill.

The "Mining Corporation Bill," one of the most important that has come before the Legislature this session, passed the Senate after a determined opposition, on the 19th inst. It provides that one-half of the stockholders of a company may call a general meeting at any time, and that two-thirds of all the stock may remove trustees and appoint new ones in their stead. One-third of the stockholders may call for a statement of the affairs of the company. The provisions of the bill will do much to secure persons of small means in holding mining stocks, but would have been still better if a simple majority of the stockholders had the power to remove trustees when desirable. Heretofore the trustees of mining companies have been elected for one year, and having complete control, did pretty much as they pleased without regard to the wishes of the stockholders.

There has long been a necessity of a law of this kind, and many a man who has been fleeced of hard earnings by the manipulations of stock by trustees will be glad to know that people are now to have some protection. Mines have been run in the interest of trustees and not for the benefit of the parties who pay the assessments and furnish the money. The stocks are "bulled and beared" by parties on the "inside" without any apparent relation to the actual value of the mines themselves. A mine may run up, according to the value of its stock from $100,000 to $3,000,000 during a year, and yet he actually worth no more at the end than at the beginning. Another great evil has been that the trustees have frequently used the funds of the company at different times for the purpose of manipulating the stock of the very mines whose interests they were supposed to uphold.

As the means of carrying on the business of mining is most conveniently done hy means of incorporated companies, that great interest should be as properly protected as possible, and in no way can it be done better than hy restraining the acts of unreliable trustees, and allowing the *real* owners of mines a voice in the affairs of the company they support. The bill as passed will prove of great value to all who are interested in mining operations and cause a reform in many practices which have heretofore been indulged in to the detriment of parties buying mining stock as a legitimate investment.

State Geological Survey.

The bill providing for the continuance of the State Geological Survey and appropriating $2,000 per month to defray expenses, has been signed by the Governor, and that necessary and highly useful work will now go on towards completion. The leading papers of the State have advocated the cause of the Survey strenuously, and although considerable opposition has been manifested by a few non-progressive members of the community and those who have no desire to promote the cause of science, we are pleased to see that the members of the Legislature and the Governor have been fully awake to the interests of the State in taking the neccessary steps to ensure its successful operation. We have already given a description of the work that has been accomplished by Prof. Whitney and his able corps of assistants, and that which it proposes to do. If the maps and books that have been, and will be, issued by the Survey were in such places as to be convenient to the miners throughout the State, for reference, that particular class of men, who represent a large and growing interest, would be materially benefitted. But not only to them, but to the farmers, and in fact all classes of our community will the advantage of the work accomplished, accrue. The *Bulletin* puts forth a very good suggestion that the Geologist ought to be authorized to forward copies of the books to learned societies in America and Europe, and to the leading libraries in this State and elsewhere. This would not only bring credit upon the people of this Coast as an enlightened and progressive community, but the exchanges we would he likely to receive would be of great use to us. We hope shortly to hear of the completion of the maps which are in hand at the office of the Survey, and congratulate not only Professor Whitney, but the people of the State of California, that this most necessary measure is now sure of completion.

THE COMMERCE OF THE WORLD.—The aggregate international commerce of the world, at the present time, is estimated at $9,237,000,000 in value. Of this large amount Great Britain, mainly through her subsidized steamship lines, is able to control within a fraction of $3,000,000,000—or nearly one-third of the entire world's commerce. It behoves the United States to be actively in earnest, in reconstructing her commercial marine.

CORRESPONDENCE.

Notes of Travel in Yuba and Nevada Counties.

[By our Traveling Correspondent.]

Timbuctoo,

Situated on tho South Yuha river, about 17 miles east of Marysville, is not a very prepossessing place, although locatcd adjacent to some of the richest deep channel mining in the State. It contains at present only ahout 100 inhahitants; its present dilapidated condition may he attrihuted to its close proximity to two other mining camps, each striving for the mastery to furnish goods and amusement for the laboring miner.

The Babb Claim

Consists of a portion of the celebrated "Blue Lead," and is situated ½ mile east of Timhuctoo. The works consist of a 10-stamp mill, run by water power, for crushing cement; not at present in operation hecause they are engaged in stripping. preparatory to taking out cement. The mill will he running again ahout the 25th inst. James O'Brien is Supt., and John Boyer is Foreman; at present working 8 men; the amount of bullion realized from this claim is satisfying its owners, and in times past, has paid fabulously.. Giant powder is used in this claim to a considerahle extent and gives general satisfaction.

Sucker Flat

Is a stirring little mining camp 2 miles N. E. of Timbuctoo, and consists of ahout 350 inhabitants. Two quite large mercantile establishments are carried on here hy D. Doherty and R. L. Crary; the latter has lately erected at this place a fine skating rink, completed, I helieve, in Nov. last. The huilding is 50x123 feet, the main hall 50x70, with a stage 30x50 feet, with dressing rooms complete; this structure has 65,000 feet of lumber in it, and cost $5,000. The different mining companies in this section, of which you have said more or less of late, are all running their usual complement of men, and the dividend paying companies are taking out the usual amount of bullion.

Smartsville.

This camp is situated 3 miles east of Timhuctoo, and about one mile south of Sucker Flat. It contains about 400 inhabitants, hut at preseut is quite dull. C. C. Duhain and J. McAllis & Co. are the merchants of this place, the latter attend to the postal affairs. There is also a hotel here, and I neglected to say that Timhuctoo and Sucker Flat were similarly provided for, hut if one good first-class hotel was to start in the vicinity of these three camps it would do the husiness of all.

Rough & Ready, Nevada County,

Is located 4 miles west of Grass Valley. It contains about 150 inhahitants, and at the present writing is the dullest camp in the State. One redeeming feature here is that the accommodations at its hotel are equal to the hest average of the interior.

Rich Placer Deposit.

Rees & Depew, owners of a (heretofore ordinary) placer claim, located one mile east of Rough & Ready, and three miles west of Grass Valley, had the good luck to run across a very rich deposit of gold, in a strata of decayed quartz. A specimen shown your correspondent weighiug ahout $40, looked to contain ahout 10 to 12 per cent. of iron; these gentlemen own 300 feet of this lead running northeast and southwest, and friends of the ahove have taken up extensions in either direction for a half mile. The amount taken from this claim since this rich deposit was fouud, will not exceed $500, hut 15 ounces of that was taken out in one afternoon, the probahility is that it is of considerahle extent. In reaching this deposit, soft granite is passed through, then a combination of iron pyrites, then a piuk colored quartz; hetween the two latter formations the gold is found, some of the nuggets, show distinctly two different deposits or formations in the same piece of gold; the upper portion heing not over 780, while the lower is at least 900 fine.

Union Gravel M. Co.,

Is an incorporation of 8,000 shares, with a capital Stock of $800,000, one half of which is owned hy the North-Bloomfield Gravel M. Co., the remainder hy A. E. Davis, C. J. Brenham, A. H. Barker and W. W. Nichols. The latter mentioned, acting as general Supt. This claim is situated upon the celebrated deep-channel "Blue Lead," midway hetween North Columhia and Lake City; and ahout 9 miles north of Nevada. City; principal husiuess office 420 California street, San Francisco. This Company own 1¼ miles in length, on the channel of the lead, which at this point is ahout one-half mile wide. There is no prohahility that the next generation will see it worked out. This claim has been worked for 3 years past, hut hydraulic washing has heen done but about 6 months of that time. At present they are working two of

The Hydraulic Chief,

Fisher's Patent, of Nevada City, which give general satisfaction. This company's improvements cousist in part of 2,000 ft. of flume, 40 inches wide by 20 inches deep, with 10 inches grade to every 14 ft., all blocked with 20 inch square blocks, 6 inches thick; 2,175 ft. of 15 inch pipe, and 800 ft. of 18 inch pipe—also a reservoir built last year at a cost of $5,200, situated one mile from the present workings. This reservoir has a capacity of supplying 500 inches of water for 48 hours, when full, without receiving a drop. At present, 400 inches of water run into their reservoir night aud day, equal to 1,050 inches of water for 10 hours run—which amount, they are using at the present writing. To get a lower grade of 152 ft. helow the present working, this company are engaged in running a

Large Tunnel,

Which, when completed, will he 1,500 feet in length, 6 feet 4 inches high, hy 6 feet wide, with a grade of 6 inches to every 12 feet. This tunnel was commenced Aug. 18th, 1870, and has heen worked with from two to three shifts per day to within the last 7 or 8 weeks, hy hand drilling, hut the rock was of such a character that it would have discouraged the most persistent set of men in the State. So slow was their progress that the distance made in the face of the tunnel for a month could be reached with a ten-foot pole. After due deliheration, counting the cost and time, for adding more improved machinery, the Company finally adopted one of Messrs. Severance & Holt's

Celebrated Diamond Drills,

At a cost of $4,000. After many delays of an unavoidable nature, such as bad roads, caused by the inclemancy of the weather, this drill was put in successful operation. To say that it gives satisfaction, would not in this case suffice, for they are overjoyed at its success; they are now making from 2½ to 4 feet per day, with three shifts of 8 hours each, in the same kind of rock above mentioned. Mr. W. W. Nichols, the gentlemanly superintendent of this mine, speaks in the highest praise of this drill, and adds in so many words, it is a great success, doing more work in one day, with the number of men above quoted, than twice as many could do in the same tunnel in a week. This drill is run hy a Hurdy-Gurdy wheel, placed on the rear of the drill carriage, which is driven hy

Hydraulic Pressure,

The water for which is conducted 3,000 ft. through an 11 inch pipe, to the mouth of the tunnel under a 274 ft. pressure; from the mouth of the tunnel to the drill at its present position, 925 feet in, hy a 7 inch pipe; there it is thrown into the hurdy-gurdy wheel 4 ft. in diameter, through a ⅞ inch nozzle which runs the drills, 2 in number. The hlasting agent used, is

Giant Powder.

The Supt. and men employed to work it, acknowledged to me that it was certainly the safest and most powerful explosive in use; further, that from 25 to 30 minutes is all they require to clear the tunnel of all bad odors after a hlast. The exploding is done by a "Fields Electric Battery," at the mouth of the tunnel, conducted hy an insulated wire the whole length of the tunnel. Eleven men are at present employed in this mine, and with that force including the running of the tunnel, I foresee a clean-up this fall of from $50,000 to 75,000. This claim never looked hetter since it was opened. L. P. MC.

Mines at Phillipsburg, M. T.

EDITORS PRESS:—We have found out a new way of developing quartz mines, and also how to make big money on them in the future. First, go to work and take out all the ore and sell the hole, he sure and leave a hig hole in the ground with a number of levels, so that you can get all the ore out and then sell the mine and work the quartz yourself; original, isn't it? You hear that there is not a developed mine in Phillipsburg, from some of those smarties that have their experience only with a hlow-pipe in St. Louis or New York, hut we have mines here with shafts over 100 feet deep and two levels running a distauce of from 68 to 90 feet from the main shaft, and also a mine that is opened 1,000 feet in length with a tunnel run in on the ledge 144 feet, with 4 shafts sunk a depth of from 30 to 75 feet on this same ground, showing a good quality of milling ore the entire distance. Would you not call these developed mines? they would he called so in a mining country, hut perhaps not among those would-he experts. Plaistead & Co. are taking out a fine lot of ore from the Eastern Camanche and also from the Cordova lode; they intend starting the St. Louis mill in a few days. The Captain is an experienced mill-man and is confident of making a good run, being well pleased with the ore in sight.

Dr. J. M. Merrell has a set of men at work on the Western Camanche lode, and Estell & Co. are taking out quartz from the Emma mine that averages over $200 per ton by assay. Professor McArdle has a number of men at work on the Hope mine, developing it for the St. Louis Co. He is getting some very fair prospects and has great confidence in his enterprise.

The Imperial Silver Mining Co. is hard at work; their five-stamp battery with wood stems is pounding away. They are crushing dry and keep 25 men employed at the Trout mine and mill. All the Co. wants is a good 10-stamp mill and their fortune is in sight. They have several thousaud tons of ore in sight that will work $150 per ton hy roasting process. Things look more favorahle in this place than ever before. "OLD MICHIGAN."

Phillipsburg, M. T., Feh. 29.

PROGRESS OF SILVER MINING IN MONTANA.—The new smelting works at Helena, Montana, are reported to he a decided success. Since this has become generally known in the Territory, a great deal of prospecting for lead and silver ledges has taken place, especially in the vicinity of Helena and Jefferson. The discovery of several fine ledges is said to be the result. Most of them are already vigorously worked. A very large vein of argentiferous galena has heen discovered two miles from the Gregory, in the Jefferson mines, but on the Boulder slope. It has the extraordinary width of 21 feet, but assays only from $45 to $100 in silver per ton. But as the lead ores are reported to occur so solid that they may he at once used at the furnace, the discovery is an important one.

EMMA.—Prof. Silliman, writing to a friend in England, says that since his report was written, and up to the present time, he is advised hy those at the mine that the reserves are in the greater part intact, the daily supply of ores (ahout 50 tons) being drawn chiefly from new and virgin ground, opened in course of explorations advised hy Prof. Silliman. It is understood to be the policy of the new management to follow the advice of Prof. Silliman—to hold intact the great body of their reserves and push on new explorations in virgin ground—a policy which has already richly rewarded them, and is the only safe policy in any mine. So far as the mine is concerned, it is truly surprising in its productiveness.

A RIVAL TO TEA AND COFFEE.—Tea and coffe are threatened with a Brazilian rival, called guarana. Guarana consists of the seeds of a tree known to hotanists as the *paulinas sorbitis* which is very abundant. The tree produces a fruit about the size of a walnut, containing five or six seeds. The seeds are roasted mixed with water and dried. Before being used they require grindiug when they fall into a kind of powder. The active principle is an alkaloid identical with that found in tea or coffee, but there is twice as much of it in guarana as there is in tea. The effects are similar to those of tea and coffe.

THE Grass Valley *Republican* of the 6th says: We understand that a party at Truckee have a contract for making one million bushels of charcoal. A large portion of the work is to he doue hy Chinamen. One million bushels of charcoal will weigh ahout two hundred thousand tons, and would require eighty trains of cars to remove it, allowing two hundred and fifty tons for each train. We suppose this large amount of coal is required by the Union Pacific and Central Pacific Railroads for their various machine shops. Truckee is the most accessible point for timher on the entire line of the continental railway.

An Apocryphal Comet.

A report has obtained circulation, probably without foundation, that a Geneva Professor has discovered an immense comet, which from its direction must collide with the earth on the 12th of August next. It is also stated that many weak minded people, both in this country and Europe, are very much alarmed at the announcement. So far from such an event heing unwelcome to scientific men, nothing could be more acceptable to thom than to have a large comet approach near enough to the earth to switch its tail in the face of mankind, for no such body (save Enck's, a very small and distant one) has made its appearance in the heavens since the great value of the spectroscope in the determination of the constitution of such wandering hodies, was fully understood. The next comet which does approach very near the earth will he closely scanned, and will enable science to determine, with great precision, in regard to its physical characteristics.

As to any harm heing apprehended from auy such source, there is little need for fear. It has been quite fully determined that the most of them at least are comparatively harmless bodies—nothing in fact hut huge "gas-hags" scarcely more tangible than the streak of light sent out into space hy a lantern on a dark, foggy evening. Thore is little doubt but that the earth has passed through the tails of at least two comets within the last forty years, without knowing it at the time—the phenomena attending the passage having, in both cases, been attributed, at the time of the passage to some peculiar atmospheric phenomena. The first one, about 1837, is well remembered hy the writer. The atmosphere over nearly, or all this continent was aglow with a red lurid light, which caused alarms of fire in various parts of the country—the atmosphere having the appearance given hy the reflection of a fire at a great distance on a slightly foggy night. The continuance of the phenomena was observed for several hours.

FENCING.—The fence is a costly structnre. Illinois is said to have ten times as much fence as Germany, and Duchess county, New York, more than all France. A narrow path divides farms in France, Germany and Holland. In South Carolina the improved land is estimated to he worth $20,000,000; tho fences have cost $16,000,000. The annual repair is a tenth of this. A recent calculation places the cost of fences in the United States at $1,300,000,000. Nicholas Biddle, thirty years ago, said the Pennsylvania fences had cost $100,000,000. In Ohio they are put at $115,000,000, and in New York at $144,900,000. Some day fences will probably disappear, and houndaries will be marked with fruit trees or neat hedgerows.

A PYRITES GROOM.—California will appreciate the following from an Eastern Exchange: A verdant-looking Vermonter appeared at the office of a chemist with a large bundle in a yellow bandauna, and opening it, exclamed: "There, doctor, look at that." "Well" said the doctor, "I see it." "What do you call that, doctor?" "I call it iron pyrites." "What, isn't that gold?" "No," said tho doctor, and putting some over the fire it evaporated up the chimney. "Well," said the poor fellow, with a woehegone look, "there's a widder woman up in our town has a whole hill of that, and I've been aud married her!"

IRON-PAPER.—German journals complain that this article, which is simply commou paper mixed while in the pulp with iron filings, so as to increase the weight, is "shamelessly advertised in all English aud American papers," and is particularly recommended to shop-keepers for wrapping up their wares. As the papers in which groceries are put up are generally weighed along with the article, there can be no doubt that the use of such paper is fraudulent. But we must demur to the assertion that it is advertised in all English papers.

MINING IN PORTUGAL.—The operations at the Chans silver lead mines are heing prosecuted with all practicahle speed, the indications presented from lodes already discovered, far exceed the expectations held out by the promoters, and there is every reason to justify the prediction that this will prove one of the great prizes of 1872.

BRAZIL, Ind., claims to produce its iron at a cost of $25.50 per ton, with coal, two tons at $2.50, and ore, one and five-eights tons at $8.00.

Mechanical Progress.

Utilizing the Rivers of France.—London *Engineering* gives an account of a grand scheme for utilizing the French rivers, proposed to the French government several times by T. de Gamond, and now brought up again. It is proposed to suppress the natural profile of the large water-courses which are imperfect, and to substitute for them a series of regular planes in successive slopes, or, in other words, to change the inclined planes of rivers into hydraulic staircases. By means of dams, reservoirs, etc., the amount of water in the river channels would be regulated, and therefore the irrigation of land, motive power, navigation, etc. Floods, washing away of land, filling up of river beds, etc., would be avoided. By means of dams the level of the outfall of oceanic rivers is to be raised, sensibly, say two feet.

A table, prepared by M. de Gamond, gives the total mean volume of daily discharge of the rivers into the sea as 6,348,958 millions of cubic feet. This would irrigate 45,000,000 acres, at the rate of 140,000 cubic feet to the acre; or would furnish by its fall 12,000,000 horse power. In addition to the benefits (mentioned above) to accrue from the scheme, industrial establishments could spread themselves over the whole face of the country under the most favorable circumstances, the use of steam would be reduced to very narrow limits, and the exhaustion of the coal supplies would become a very remote question. The access to the great sea-ports would be improved for ships of heavy tonnage, and the great river harbors would be opened for navigation by transforming the sea-channels into vast lakes of fresh water, independent of the sea. The ebb and flow of the tide would be suppressed. Internal navigation would be greatly improved, and great lines of water communication could also be completed. Fish culture could be introduced on a grand scale, etc. Finally the enterprise would be exceedingly profitable to the parties undertaking it. Notwithstanding the brilliancy of the scheme the project will hardly be carried out just at present.

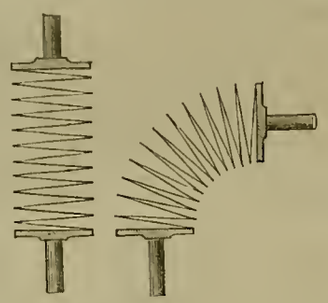
Improved Axle-Boxes.—*Engineer* of Feb. 9th calls attention to an improved axle-box, designed for railroad cars, which promises to effect an important saving in the working expenses of railroads, and a greater immunity from danger from a certain class of accidents. Lubrication at the sides is one of the principles involved, and capillary attraction the condition under which the oil is applied to the journal is another. Springs are also introduced to keep the pads in position. One of these boxes was lately exhibited, according to *Engineer*, which had run 19,000 miles with the consumption of only half a pint of oil. It is also claimed that a box filled with oil in the repair shop, will not again need refilling until in ordinary wear it is time for it to go again into the repair shop for general overhauling. Moreover, the oil in the box cannot be readily tampered with. They are known as the Beuther axle-boxes, and have already been introduced upon 26 railroads on the continent of Europe, aside from their very general introduction into use in England.

Effective Work of Steam Engines.—The *Deutsche Ind. Ztg.* lately contained an article on indicators and Brake Dynamometers and on the method of ascertaining the amount of useful or effective work of steam engines. This can generally be found by three methods:—By calculation; by means of a brake dynamometer; or by the indicator-diagram which gives the indicator horse-power from which the actual or effective brake power can be derived. The third method is the simplest. From a large number of experiments upon engines of different dimensions, it would appear that no smaller ratio than 0.70 between brake and indicator is impossible, and that not more than 0.90 is attainable.

Artesian Well at Boston.—A well was commenced last March and work has since been steadily going on at a rate of 1 to 15 feet daily. It is now down 1,000 feet and has cost $15,000. The diameter of the bore is 5 inches; the drill is 4 inches across; the drill and iron shafting which connects it weighs now 1,200 lbs., and the rope 900 lbs. A 16-horse-power engine is employed, with a walking beam of 36-inch stroke making 30 strokes per minute.—*Am. Railway Times.*

New Mode of Transmitting Rotary Motion at Angles.

This ingenious invention is shown in the engraving. It is a spiral formed of a plane iron, or rather steel, band which is attached at its opposite ends to the two shafts to be connected. The diameter will necessarily, in order to secure sufficient strength, be considerably larger than that of the shaft; and the attachment may be made by means of a cast iron cap, having on one side a socket for the shaft and on the other a flat surface to receive the spiral. The breadth of the iron band or ribbon which forms the spiral is about an inch and a half, and its thickness a little more than a quarter of an inch. The total diameter of the spiral is about one foot. For a joint of transmission forming a right angle, about fifteen turns of the spiral will suffice. The entire spiral may be



made of a single ribbon, or it may be made up, as it has been in some cases, of a number of parts connected together by tongue and groove.

Experience has proved that this mode of transmission performs perfectly, without being liable to get out of order or to give way. Its strength is very considerable, but cannot be indefinitely increased, since a thickness exceeding that which is adopted would bring too great a cross strain on the metal. A number of these joints have been in operation without accident for several years. It is the invention of Mr. Thirion, of Belgium.—*Scientific American.*

Diamond-Toothed Saw.—A diamond-toothed saw for stone quarries has been invented in Vermont, and after three years experimenting, is said to have been perfected so far as to work very satisfactorily. The Boston *Advertiser* says of one of the machines on exhibition in Boston: The main feature consist of a straight saw armed with diamond points moving back and forth through the stone, with drills working vertically to free the ends of the kerf. The diamonds employed are of the black variety, on a half-inch width, and with a six-horse-power engine can be sunk in the solid quarry from six to twenty-four inches per hour, according to the hardness of the material operated upon. The instrument is very compact, and one of the power displayed can be operated by two men, whose services, together with the fuel consumed, will amount to less than ten dollars a day, effecting an estimated saving of the labor of fifty men, and reducing the cost of solid building material one-half.

Improved Iron Rails.—The demand for steel rails is so great that steel-rail makers are said to be nearly all full with orders for two years to come. At this juncture an English firm has patented a new rail pile which is said to give an improved iron rail, and which is favorably noticed by the *Engineer*. The usual rail pile is built upon the slab of crystalline iron which forms the head of the rail and must be placed in the heating furnace in the same position, viz., the slab on the bottom or coolest part of the furnace and the fibrous iron uppermost and exposed to the most intense heat. The result is in many cases that the fibre of the flange is destroyed while the head is imperfectly welded, and there is produced a brittle rail with a laminated head. In the patent the fibrous iron is below, the crystalline above, giving superior rails.

Asphalt Roads in Paris.—It is stated that the authorities of Paris are about to give up the asphalt paving and return to the old-fashioned stones, in consequence of the great expense of keeping up the former.

Glycerine for Paper.—Small quantities of glycerine are sometimes added to paper stock to give the paper flexibility, but especially to give copying paper the quality of taking up color readily.

Scientific Progress.

New Method of Nickel Plating.—A simple and cheap method of nickel plating, which is open to the use of all, has been invented by Prof. F. Stolba. The process is, in brief, as follows: Into a vessel of porcelain or metal, preferably copper, is poured a concentrated solution of chloride of zinc, made by dissolving commercial zinc in common hydrochloric acid. From once to twice the volume of water is added, the solution heated to boiling and hydrochloric acid added drop by drop until the precipitate (formed on diluting the chloride of zinc with water) is redissolved. As much zinc powder as will cover the point of a knife is now added, whereby the metal of the vessel becomes zinc plated. Enough nickel salt (the chloride or sulphate or the double sulphate of nickel and potassium) is introduced to color the liquid distinctly green, after which the articles to be plated, with surfaces perfectly free from fat and rust, and with them some small cuttings of zinc, are put in and the liquid again boiled. The work is finished in about 15 minutes. If any part of the articles is not plated, the boiling is continued, fresh pieces of zinc and, if necessary, fresh nickel salt being added. It is important, if the coating of nickel is to be brilliant, the liquid on boiling shall not be cloudy from basic zinc salt, or acid from free hydrochloric acid. The plated articles are well washed with water and cleaned with polishing chalk. The same liquid may be used repeatedly for plating. The nickle salt need not be chemically pure, but must contain no metals precipitated by zinc.

Phosphorescence of Animals.—Prof. Panceri, of Naplee, who has been studying the phosphorescence of marine animals, finds that in all cases examined this is due to matter cast off by the animals—it is a property of dead, separated matter, not of living tissue. In all cases (except *Noctiluca*) this matter is secreted by *glands*, possibly special for this purpose, but probably the phosphorescence is a secondary property of this secretion. Further, this secretion contains epithelial cells in a state of fatty degeneration, and it is these cells and the fat therefrom which give rise to the phosphorescence. This brings the phosphorescence of marine animals and that of decaying bones, etc., under the same category. In one species, this property was made the means of studying the rate of transmission of an irritation. For when one extremity of a *Pennatula* is irritated, a stream of light runs along the whole length of the polyp-colony, indicating the rate at which irritation is transmitted. This rate can be accurately measured. In these studies the spectroscope was used.—*Nature.*

Primordial Fauna in Nevada.—An interesting discovery has been made, carrying the primordial fauna much further west than ever before found. The most western locality of potsdam sandstone fossils previously described is in the Big Horn Mts., at the head of Powder river, in long. 107°; but Mr. J. E. Clayton has discovered fossils of the same period near the 116th meridian. These he sent to Prof. Whitney, of the California Geological Survey, who has an article thereon in the February *American Journal of Science*. The fossils occurring in limestone, belong to the characteristic potsdam families of the *Lingulidæ* and the *Paradoxidæ*. The specimens contain many individuals but few species. *Agraulos Ceurni* is the most abundant species, with fragments of (apparently) *Concoryphe* and the genera *Linguiepis* and *Obolella*. Other specimens found by Mr. Clayton on Shell Creek, is mottled buff and gray limestone, also demonstrate the existence of primordial fauna, but the fragments are very imperfect.

Masses of Meteoric Iron, the largest said to weigh 25 tons, were found last year in Greenland, lying loose on the shore, but immediately resting upon basaltic rocks (probably miocene) in which they appear to have been imbedded originally. They contain nearly 5 per cent. of nickel, with 1 to 2 per cent. of carbon and are chemically identical with many aerolites of known meteoric origin. Notwithstanding the place they were found, on removal they speedily fell into powder, possibly from the absorbence of chlorine and the formation of ferreous chloride.—*Chemical News.*

Mastodon in Massachusetts.—The first mastodon remains ever found in Massachusetts consist of a tooth, discovered last fall in Colerain, a northern border town.

Fortieth Parallel Survey Report.—The Report on Botany, by S. Watson, aided by Prof. D. C. Eaton, has appeared. It is illustrated by a map and 40 plates and is excellent in its matter and appearance. A general Report forms an introduction to the Catalogue which makes up the principal bulk of the volume. This "Catalogue" is not a mere list of names, but a systematic account of the plants collected. The geographical and meteorological notes and those on the general character of the vegetation are well written and most interesting.

Agricultural Resources of the Great Basin.—A few pages at the close (we use the remarks of the *American Journal of Science*) are devoted to the consideration of the agricultural resources of the basin, the limit to which is fixed by the deficiency of water. The most fertile localities lie at the base of the Sierrae; but, as a rule, there is an apparent absence everywhere of a true soil or mould resulting from the decomposition of vegetable matter. A moderate amount of alkali in the soil appears not to be detrimental to culture. The soil which produces sage brush seems to be always cultivable when it can be irrigated. With the present supply of water, most economically used, it is thought that only 1,000 out of 34,000 sq. miles of Northern Nevada could be cultivated; of the southerly portion and of western Utah, much less. Eastern Utah, with more water from the Wasatch and Uintah, Mts. is much more favorably situated. The absence of graminivorous animals, except rabbits in the valleys and a few mountain sheep and antelopes in the higher ranges, shows that the country is ill adapted for grazing. *Eurotia lanata* and a few other chenopdiaceous plants are eaten by sheep as a substitute for grass. The question is raised whether the existing plants, or some substitute, may not be turned to profitable account, and whether some forms of orchard, vineyard or tree culture may be made to thrive here. The present plants on the whole are not lacking in expansion of foliage or succulence, from 55 to 80 per cent. of foliage—and evaporate daily an amount equal to three-eights of the weight of their available material. This loss is made good, not from the atmosphere, but from the soil, dry as it is; yet water is rarely to be had under a depth of 100 to 300 feet, often not even at that depth. The porous soil must allow of the free upward diffusion of moisture, also of deep penetration of roots.

Diamonds in Xanthophyllite.—P. Von Jeremejew has found minute diamonds irregularly distributed through the plates of the Xanthophyllite of the Schischimekian Mts., near Slatoust. The green plates of this mineral nearest the rounded masses of talcose slate and serpentine enclose very large numbers of the crystals which are generally colorless and transparent, sometimes with a pale brown tint; the diamonds are also found in the two rocks mentioned.

Remarkable Fossil Bird.—One of the treasures secured last year by Prof. Marsh's expedition was the greater part of the skeleton of a large fossil bird, at least 5 feet high, found in the Upper Cretaceous of western Kansas. Although a true bird, it differs widely from any known recent or extinct form, and affords a fine example of a comprehensive type. The proposed name is *Hesperornis regalis.*

Microscopic Forms in the Atmosphere. According to a late communication by Ehrenberg to the Academy of Sciences at Berlin, he has succeeded in determining the existence of 548 species of organic forms, absolutely invisible to the naked eye, and yet held in suspension in the atmosphere.

Phosphorescence of Eggs of the Glow-Worm.—M. Joesuet has noticed that the eggs of the common glow-worm are phosphorescent after laying and remain so, at least for a considerable time. If one of the eggs is crushed in the dark the liquid therefrom is luminous until quite dry.

Plants of Oregon.—Mr. E. Hall last year made extensive collections of dried plants in Oregon, which are distributed in sets and sold at $8 per hundred. Full sets contain 500 to 600 species and may be obtained of Mr. C. Wright, Harvard University Herbarium, Cambridge, Mass.

Deep Sea Life.—The sea has living microscopic creatures three miles below the surface. How can they live with such a heavy pressure of water upon them?

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE COUNTY.

I X L.—Silver Mt. *Chronicle*, March 9: The richest ore ever seen in this county was taken from this mine last Saturday.

LEVIATHAN.—This mine is being opened and developed by contract, and high grade ore is being taken from No. 7 drift. Several thousand tons of low grade ore, assaying from 10 to 20 per cent. copper, are in sight and on the dump. Some 20 ft. of sandstone, saturated with over 25 per cent. of pure sulphur, have recently been passed through in sinking the incline, immediately below the large copper deposit.

TARSHISH.—On Monday last a large body of first class ore was struck, extending across the whole face of the 105-ft level, north, in the direction of the Michigan claim. Rich ore is also being taken from the 150-ft. lovel, in the same direction, as well as from the slope recently started in the lower tunnel. All the men in the mine are taking out ore in the northern drifts in the ordinary course of opening up the ground, none of the rich reserves being worked.

MONITOR MILL.—Monitor *Miner*, March 9: The mill has been running 3 days since the change in plan of roasting, and will clean up on Monday next and determine whether the plan works satisfactorily.

RED MOUNT is the name of a series of claims taken up and located this week on the northern slope of Red Mt., in this Dist. This new location consists of 5 claims of 1,000 ft. each, and covers the north extension of the old Mountain lode.

GOOD ORE.—From upper and lower levels of the Monitor No. 3 and Silver Glance, and from several parts in the Schenectady, good ore is coming out.

CALAVERAS COUNTY.

HUDSON LEDGE, CENTRAL HILL.—San Andreas *Citizen*, March 9: They are sinking on it night and day, Mr. Davis having taken a contract to sink 50 ft. deeper. The shaft is 60 ft. deep, the vein 9 ft. wide, abounding with sulphurets. Mr. Davis will commence operations in his quartz claim in Mudgett's ranch, as soon as the weather will permit.

ITEMS.—Good rock has been struck in the Petticoat mine at Railroad Flat.

The Prussian Hill Mine, near Railroad Flat, is taking out rock which appears to be very rich. A rich quartz ledge has been struck near West Point, the ledge paying on the top at the rate of $250 per ton. The Zacetara has a ledge of 3¼ ft. at the bottom of the shaft. The rock taken out is very rich. The Brackett & Co. claim in Chili gulch, is a perfect success. The Russian Hill mine has struck good rock.

WHISKY HILL.—Cor. San Joaquin *Republican*, March 12: Three hydraulic Cos. are busy at work sluicing down the gravel deposits, the Bunker Hill working night and day with 400 inches of water. The excitement in reference to these mines is increasing daily, and should the clean-up of the Bunker Hill be favorable, there will be an excitement such as this section of country never before saw.

INYO COUNTY.

BULLION.—Inyo *Independent*, March 9: On the 29th of Feb. there were shipped from Lida Dist., ore from the mill of Hiskey & Walker, Deep Springs, one bar of bullion, 255 ozs., valued at $265. Also, on the 4th of March, there were shipped 5 bars, 1,755 ozs., valued at $2,050.

SPECIMEN.—Mr. Hiskey presented us a piece of chloride ore, from one of the mines in Lida Valley, which will yield at the rate of not less than $800 per ton.

MONO COUNTY.

MILLS.—Cor. Inyo *Independent*, March 7: Mono county contains 5 mills, as follows: The "Pioneer," at Montgomery; an arastra, harrel and lavadero roasting furnace now being added. Run by water power. Worked last summer 125 tons of ore, assaying from $100 to $700 per ton, average $247 per ton. Extracted about 85 per cent. of assay, and paid well. Also worked over about 100 tons of tailings. Riley's mill, also in Montgomery; small stamps and pans; run by water power, formerly profitable, idle and dilapidated now. A small mill at Hot Springs owned by J. Partz; 4 small stamps; barrel, and separators, water power, process same as Pioneer mill, working about a ton a day and fairly profitable. Jennings' mill near Whisky Flat, a very small affair, abandoned several years. W. J. Williams & Co.'s mill built last year, steam power, 10 stamps, 2 pans, 2 separators and a White's furnace, was running a couple of months, off and on, last year, worked about 20 tons of ore, has been idle about two months.

NEVADA COUNTY.

MOUNT AUBURN. — Nevada *Transcript*, March 13: The mine is near the Newtown road, adjoining the Soggs's location, and running 3,000 ft. to Ragan Flat. Last summer a new shaft was sunk, and a north and south drift run. Rock was taken out which yielded $22.80 per ton, the quartz being taken from top to bottom. The ledge averages 4 ft. in thickness. In the south drift they did not cross the chimney of rock which was found, and when they left off work the ledge was widening and the rock showed free gold and rich sulphurets.

LOCATIONS.—The Birds Eye Cañon Co. have located a water privilege of 2,000 in., in Steep Hollow Creek, Little York township. The Big Deer Creek and Green Mountain Placer Co. have located 500 ft. of ground north of Murchie ground, and fronting on Big Deer creek Nevada township. The Big Cañon Placer Co. have located 400 ft. on Big Deer creek and running back to the centre of the hill. The Spring Ravine Co. has located 500 ft. of the bed and banks of Spring ravine, in Nevada township, for gravel mining. Joaquin M. Pavea & Co. have located 300 ft. of ground for gravel mining, on the hill between Sailor and Picket ravine on the north side of Rush creek in Nevada Township.

EUREKA.—The Black & Young mine at Rocky Glen, near Eureka, is being worked with splendid prospects this season. The last run of 30 days resulted in a clean up of between $4,000 and $5,000 though the work was done under the greatest disadvantages.

BRICKS.—Grass Valley *Union*, March 13: We saw yesterday at Findley & Co.'s Bank a pair of gold bricks worth $14,000 the result of the crushing of the first two weeks of this month at the Idaho mine.

WATER.—The North Star is not quite able to control the water. In the 800 ft. level it is slowly gaining.

FRENCH CORRAL. — Several extensive gravel claims at French Corral have been consolidated, and the owners are about to run a tunnel from the South Yuba river, so as to drain the French Corral mines. The tunnel will be about 2,500 ft. long and will be through very hard rock.

Extensive tunneling is also to be commenced and carried on from Sweetland creek so as to drain the Manzanita and other claims adjoining. This will require only some 400 or 500 ft. of tunnel.

RANDOLPH HILL STRIKE.—The strike continues to pan out. Reese & Depew took out about 50 ozs. of gold yesterday in a few hours.

SAN DIEGO COUNTY.

BULLION.—San Diego *Union*, March 7: The bullion shipment to S. F. yesterday, was $550. A clean up of several of the Julian and Banner mills will take place tomorrow.

JULIAN AND BANNER.—DeFree and Co's. mill has just cleaned up a small lot of ore from the Butler lead which yielded $53 per ton. A few days ago the same mill finished crushing a lot of Hayden rock which went $25 per ton. They are now engaged upon a lot from the Van Wert mine, about 30 tons, which will be cleaned up about Saturday. After they have finished crushing the Van Wert rock they will commence on another lot of Owens ore. Water has been struck in the shaft of the latter mine, at the depth of 200 ft. The ledge at this depth looks splendidly. Wilson & Co's. mill is working on ore from the Helvetia mine, and will probably clean up to-morrow. Reynolds & Co's. mill has resumed work and is engaged upon a lot of ore from the Andy Johnson mine. Active operations have commenced on the Excelsior lead from which some good ore is being taken. The Ready Relief mill is crushing rock from the mine of that name at the rate of 2 tone per day. The rock it is expected will go about $40 per ton. The Redman mill is also working on Ready Relief ore, and the Co. are at the same time actively engaged in developing their own lead. The Antelope mill is receiving plenty of ore for crushing. The mill is engaged upon rock from the City of Richmond. The props. of the lead of the same name are busy at work taking out rock and will soon have sufficient quantity in readiness to crush, which will keep the stamps employed for some time. Nearly all the ledges in the Banner dist. are being actively worked.

STONEWALL MINE.—Their steam pump is working admirably. It has reduced the water in the shaft considerably. The mill has commenced to run.

SAN LUIS OBISPO COUNTY.

CAMBRIA MINES.—San Luis Obispo *Tribune*, March 9: We hear glowing accounts in relation to the silver and quicksilver mines of Camhria. The excitement there is intense. Mining feet change hands rapidly.

SIERRA COUNTY.

PAYING.—Mountain *Messenger*, March 9: The pans at the Butte Mine, for working tailings, are paying exceedingly well. Several more will be put in this summer.

At the Orleans claims at Little Grizzly, 42 ozs. of gold were taken out recently in a week's work. This claim has paid well all winter.

MORRISTOWN.—Cor. same: The American Co. has had a full supply of water in their ditches, and doing considerable work, in running off pipe-clay. Perkins, Williams and Co. have made a nice clean-up, but I am not informed as to the amount. Their claims look well.

TRINITY COUNTY.

GOING IT.—Uniouville *Journal*, March 7: Charley Tourot has had no water in his ditch this winter for fear of injuring it. This week, however, he turned the water in and is rushing the dirt off double-quick.

DUTTON'S CREEK.—Dixon, Hurst & Co. have half of their big blast run off.

QUARTZ.—James Morris and Jonathan Smith have found a quartz ledge in the diggings discovered back of Corhus' store, on Indian Creek.

Nevada.

EUREKA DISTRICT.

RICH ROCK.—Eureka *Sentinel*, March 8: Some rich rock has been struck near the toll house, on the Eureka road. Several claims have been staked off in that vicinity lately.

STRIKE.—A belt of ore 80 ft. wide and of indefinite depth was struck in the Eureka Con. yesterday.

LOOKING WELL.—The Adams Hill mines are looking splendid. A large amount of ore is coming to the surface, and all the workings are improving at the bottom. There are several hundred tons of first-class ore on the dumps, which will probably be milled before long.

TO START UP.—Preparations are being made to resume work on several mines in the dist. that have been idle during the winter.

MCGARRY.—We were informed that considerable well-directed labor is being expended on the different mines of the dist.

STARTED UP.—The Consolidated has started another furnace—making 4 in successful operation.

RICHMOND.—The Richmond smelting works are to be supplied with new hoilers and engine of the largest pattern.

GEN. LEE.—A body of ore 3 ft. wide, was struck in the mine yesterday. The ore was found at a depth of 200 ft. in the main shaft, and a considerable body was also found in the tunnel.

ELY DISTRICT.

BULLION.—Ely *Record*, March, 7: W. F. & Co. shipped to-day bullion valued at $44,875.27.

REESE RIVER.

MORE ORE.—Reese River *Reveille*, March 9: Preparations are being made for working several mines on Lander, Central and Union hills as soon as the spring opens.

WASHOE.

RESUMED.—Virginia *Enterprise*, March 10: The Vivian mill, Carson river, started up day before yesterday.

THE Petaluma mill now being thoroughly overhauled, will start up in a few days.

SUTRO TUNNEL.—The Sutro tunnel was yesterday in 2,775 ft., with hard ground at the face. At shaft No. 1 they are hailing and putting in a steam pump. No. 2 is down 230 ft.; ground good and but little water coming in. At shaft No. 4 the machinery is all in, and they will get the steam pump to running to-day.

OPHIR.—The drift from the 1,300 ft. level of the Ophir will probably reach the lead by next Saturday. The drift south on the 1,100-ft. level is being pushed vigorously. When it has reached the intended length 4 or 5 cross-cuts will be simultaneously made.

THE Sierra Nevada mine is looking well. A raise to the hight of 4 or 5 sets of timbers has been made in the new vein.

NEW MILL.—A Mr. Soderlinge, day before yesterday started up at American Flat a neat little 2-stamp mill.

BIG DAYS WORK.—Gold Hill *News*, Mar. 9: From the mines of Comstock ledge, yesterday, there were shipped to the mills on the Carson river, 110 car loads of ore, an aggregate of 880 tons in all. On the 10th (same paper 11 inst.) 105 car loads were transported.

IN OPERATION.— The second of the 2 new hoisting engines at the Crown Point works were started up on Friday, and both are in full operation, running smoothly and well, and hoisting about 500 tons of ore per day.

WHITE PINE.

NORTH AURORA.—White Pine *News*, Mar. 9: The Risdale chamber has improved greatly since last report. A force of men is breasting in the northeast end of the chamber. The shaft, a continuation of the original Risdale shaft, is down 73 ft., and the showing of ore in the bottom is of a higher grade than any (not excepting the Eberhardt) ever extracted from the English Co'e. mines. The ore commences 57 ft. below the top of the shaft and, as far as bottomed, shows a body of ore 16 ft. thick. The shaft will be sunk deeper. The ore is of a regular grade, requires but little sorting, and averages $80 per ton. There are 2 shifts of 12 men in the northeast chamber, and the number will be increased as soon as the opening can be made. About 50 tons of ore are hoisted per day, by the whim. The ore in the new chamber south of the Lady's chamber has increased in body and richness; the workings are in 75 ft. A contract has been let to run a drift from the Lady's chamber to the south chamber.

MAMMOTH.—This mine is on the north slope of Treasure hill, toward Hamilton. Mr. Paul, the present foreman, commenced work on the center of the location, and discovered a fine body of ore. An open cut was started, and a tunnel is in 100 ft. on ore. Back of the open cut a shaft is down 51 ft. A drift from the shaft shows a ledge 12 ft. wide; 49¼ tons of ore were worked at the Swansea mill in Nov., which yielded $41 to the ton.

SAN JUAN DEL RIO.—The shaft is down about 30 ft., in a good body of ore.

GEN. LEE.—The drift from the shaft is in 40 ft., showing ore the whole way. The last 5 ft. run shows an improvement in the ore-body in grade. Piling on the dumps.

EAST SHEBOYGAN.—The force prospecting has developed good prospects since last report. The Exchange incline is going down in spar by contract. The indications show well for ore.

EBERHARDT.—A force of men will be put on in the different workings to-day, and should the weather be favorable work will continue as usual in the mine.

COPPER GLANCE.—The West drift goes ahead as usual Running in black spar and quartz mixed.

NOONDAY.—Work going ahead as usual, and no change in the grade of ore.

Arizona.

ITEMS.—Prescott *Miner*, March 2: The latest from the Tiger is to the effect that the tunnel was in 180 ft. from the bottom of the 100 ft. shaft; that rich ore was getting plentier. Mr. Burger's mill near Ehrenberg, is almost finished, and work upon the mine is progressing favorably. At Castle Dome, a short distance above Arizona City, miners are taking out a great deal of ore, containing silver and lead, which they are shipping to San Francisco.

A letter from Florence, has the following: The last heard from the Silver Queen they were down 18 ft. on the ledge. The ore is rich in gold, silver and copper. It is rumored in town, during the week, that Mr. Simmons had found a rich mine somewhere west of town. Col. Cany has recently received some big assays from rock which he forwarded to San Francisco. A recent run of 3 days with 4 stamps at the Del Pasco mill netted the owners about 50 ounces of gold, worth $17 per ounce.

Colorado.

ITEMS.—Georgetown *Miner*, March 7: Baily & Nott has shipped during the past week 35½ tons, on account of owners, of rich smelting ore.

Another crusher will soon be in position in the mill of the Silver Plume Co. at Silver Plume. This mill will soon have a crushing capacity of 26 tons per diem.

About 1,160 ft. from the mouth, and about 600 ft. from the surface, the Marshall tunnel has cut a vein of mineral, valuable for silver as well as lead.

SHIPMENTS.—The last shipment of ore, 21,515 lbs. of the Marshall S. M. Co., contains 6,949 ozs. of silver and 35 per cent. of lead. The coin value of the silver in this lot of ore is, $8,984.35. The lead contained in the ore, 7,630¼ lbs., at 5 cts. per lb., in coin, would be worth $381.51. Total coin value of silver and lead in the ore $9,365.-87. The amount of ore shipped out of the county during Feb., foots up to more than 240 tons. The average value of the ore, in coin, will amount to $400 per ton, or $96,-000 per month.

HIDDEN TREASURE.—This lode is on

Leavenworth, a short distance above the Equator and Compass & Squaro lodes. Tho discovery is being worked by Clark & Co. and McCoy & Co. East of tho discovery, Stowol, Cox & Co., Hurd & Co., Chipman & Co., Mahancy & Fellows, and a Co. of Swedes are working ground in tho order named. West from the discovery Mairs, Shea & Co., Ingrnm & Co., Papin & Co. and J. Gunow & Co. are working gronnd in the order named. Nearly every Co. have struck good pay. The valuo in coin, of the oro yield of the mino is at the rate of $1,000 per diem.

Gold Hill.—Central *Register*, March 6: A private letter informs us that Cort & Day expect to havo their shaft and engine house on the Horsofall lode completed by the 15th or 20th of March, when they will commence hoisting water. As soon as the water is out of the mino, a large force of men will be put in the mino to work night and day.

Wm. Tennis has leased the Teller property, on the Adelino lode, also the adjoining claims to the west, on tho Gunnel hill. He takes possession to-morrow, and will push the work with energy.

Shipments of bullion from the Caribou mill are becoming regular and freqnent.

S. B. Andrews, of Carihou, placed some ores on our table, from the following lodes, viz: "Seven-thirty," "Caribou," "Wabash," and "Potosi." Of these lodes, he says, the first carries a pay-streak 18 inches in thickness, and the drifts are being run east and west on the vein. The main shaft on the "Caribou" 250 ft. deep. The first-class oro in this shaft is one ft. thick. The east shaft is down 140 ft., and shows a 4 ft. vein of oro. The "Wabash" is 60 ft. deop, and has 15 inches of good ore. On tho "Potosi," the main shaft is 75 ft. deep. A drift has been commenced at a depth of 50 ft. The ore is 2 ft. thick, and assays $150 per ton. Eight tons of ore have just hcen shipped from this mine, to the Middle Boulder mill.

Idaho.

Local Record.—Silver City *Avalanche*, March 9: Under the guidance of J. Jewell, foreman of the Mahogany, we went through the various levels, drifts and stopes of that mine on Wednesday. The main shaft is down 437 ft. from the surface. Four ft. from tho hottom of the shaft a tank has been put in to receive the water from the 5th level after tho vein shall have been tapped. Tho cross-cut from the hottom of the shaft is in ahout 8 ft., and Mr. Jewell expects to rnn from 8 to 10 ft. further heforo striking tho ledge. Tho shaft will shortly be put down to the 6th level. The 4th level is at a depth of 328 ft. The length of the cross-cut from tho shaft to the ledge at this point was 12 ft. Drifts have been rnn hoth north and south on the vein in the 4th level. The South drift has been extended 95 ft., and stopes taken off from cross-cut for 61 ft. in length with an average hight of 25 ft. The north drift is in 79 ft. with the hacks taken away for 65 ft. in length, and at an average hight of 33 ft. There is yet 35 ft. more to rnn before reaching the South Chariot line; so that there is a fine vein of stopes, 126 ft. in length and still getting longer by extending south. Throughout the 4th level the ore is better than was ever before found in the mine. The pay streak is about a foot in width, and will pay over $100 per ton. Free gold and pure silver in abundance can he seen in almost any of the quartz, and also in the granite casings. They have shipped ahout 250 tons of ore to the mill and have 50 tons on hand in the ore house. Forty-three men, all told, are employed in the mine at present, and they are takiug out from 12 to 15 tons of ore every 24 hours.

The South Chariot 4th level drift is in 228 ft., showing a 15-inch ledge, and looking hetter than over before since it was started.

The 2d lovel drift of the Minnesota is in 140 ft. north from the shaft and 130 south. The ledge is from 6 to 15 inches in width, of ore that will pay ahout $60 per ton.

South Mountain. — Boise *Statesman*, Mar. 9: Twenty-eight mon have beou wintering in South Mt. Tho country has heen prospected in a limited manner for ahout 5 miles square. About 150 ledges have heen located. The Bay State, Yreka, Independent, Mammoth, Original and Monitor are the ones that are boing prospected, and may he considered as fairly tested. The Bay State is nearly solid galena; 5 tons sent to S. F. yielded $105 to the ton in silver, and 45 per cent. lead. The work is down 16 ft.; it shows an average of 4 ft. in width. The Golconda is down 40 ft.—300 tons taken out. The lead opens 60 ft. wide. The ore is half carhonate and half galena. The Yreka is down 20 ft.; shows a large lead but the width is not known. Some of the ore has been sent to S. F., and works $100 to the ton; 50 to 100 tons havo hcen taken out. The Independent is down 18 ft.; shows 15 ft. wide; 200 tons of ore have been takon out, and the ore is the same character and valuo as the Yroka, only a little more galena. The Mammoth shows on the surface 40 ft. wide. Only 3 days work havo been done on this lead. The oro assays $303 to the ton. The Original shows 125 ft. wide on the surfaco. They havo run a cut 45 ft. across, and 25 ft. deep in the deepest placo. Tho average assay is $42 in silver and 27 por cent. lead. The Miami is down 45 ft.; shows 6 ft. wido; assays $120 to tho ton. Tho Monitor is down 25 ft., or rather they have run a tunnel on the lead 60 ft., and are in 25 ft. below the surface; shows 20 to 30 ft. wido.

Throo furnaces are to he pnt up in running order by the 1st of July.

The Outlook.—Idaho *World*, Mar. 2: Most all the miners around Idaho City aro making preparations to commence work, and soveral of tho short ditches will he shoveled out during the coming week. Tho Chinese Cos. who are working ground opposito town, under contract with the Buena Vista Bar Co., have been groundsluicing for tho past week, and have about 110 hands at work. Keller & Bidwell and West & Ralston will have their claims running in Bear Run in a few days, and the Buena Vista Bar Co. also have men at work on their bar claims on the west side of Elk creek, putting things in shape to start thoir hydranlics. The Buena Vista ditch was cleaned out, and the wator has been running throngh it for ahont 10 days, and tho old Dunn ditch will he shoveled out and water put through it in tho course of a week. The Alderson ditch, the Big ditch, and More Creek ditch, helonging to the Buena Vista Bar Co., also, will probahly not be cleaned out for a couple of weeks yet.

W. J. Hanks, foreman of the Empire, has that mine in splendid shape for working. Stopes are being driven north the entiro depth of the shaft, which is down 90 ft. from the surface. The ledgo averages a foot or more in width as far as it has yet heen worked, and the ore pays about $150 per ton. A new ledge, 1½ ft. in width, has just come into the hottom of the shaft from the west.

The Morning Star shaft will be down 220 ft. next week, from the hottom of which a drift will he run north 200 ft. to connect with the old works.

Lower California.

Machinery.—Ahout 2 tons, consisting principally of a railway track, were shipped to Ensenada yesterday. The material is intended for the mino and mill of Mr. McKean.

Montana.

Beartown.—Deer Lodge *New North West*, March 2: The residents of Beartown and vicinity are making preparations for an uncommonly prosperous season. The claims of Brady & Co. and Brennen & Co. immediately above town, have heen worked successfully all winter, and there is half a mile of the gulch above them yet to he worked. The gulch for 10 miles below the town is heing mined, with good results, and over a 100 cahins have busy occupants.

Silver Bow.—Deer Lodge *Independent*, March 2: Should the present warm weather continue, mining operations will ho resumed much earlier this season than common.

Clean Up.—Helona *Gazette*, March 7: From a new lode opened this winter in the Sultana dist. on the Park, at the head of Grizzly gulch, called the Choctaw, a run was made on the quartz this week, at Judge Turnley's mill, which yielded $44 to the ton. The crevice of paying quartz is about 1¼ ft. in width, and shows every indication of widening out.

Bullion.—Helena *Herald*, March 7: Tho Helena Reduction Works, 2 furnaces in blast, turned out in the 12 hours run last night, 38 hars of crude bullion of 50 lbs. each.

We saw to-day a specimen of silver ore from the Poor Man's lode, at Phillipsburg, which will assay $10,000 to the ton.

New Mexico.

Our Mines.—Santa Fé *Post*, March 2: We learn from Elizabethtown that prospects for the coming season are very hopeful. At the Corona del Pueblo silver mines in Socorro county and Silver City mines in Grant county great activity prevails.

Oregon.

Rich Mines.—Oregon *Sentinel*, March 9: The claims of O'Shea & Stevens, on Coyote Creek, are paying from 2 to 3 ozs. per day to the hand, for drifting.

Nugget.—Mr. Beekman, bought on Monday, a gold nugget of a Chinaman, supposed to have been found on Jackson creek, that weighed 2¼ lbs., and valued at $444.25.

Utah.

Bullion.—Salt Lake *Tribune*, March 13: Since tho 9th inst. W. F. & Co. has received from Raymond & Ely 40 bars valued at $62,010.22. On the 12th they forwarded to N. Y. 15 bars valued at 14,-084.46 from the Meadow Valley works. Last week Durant & Cutting received 86,-000 lbs. of ore from the South Star and Titus mines. N. P. Woods shipped yesterday 4 car loads of hullion from the Sultana works, American Fork.

Discovery.—A large amount of galona ore has been struck in the Winnomucca miue Bingham cañon, yielding several ozs. of silver per ton.

Star.—Specimens from the Mary Josephine, at a depth of 6 ft. assay $16,000; Yellow Jacket ore, from a depth of 20 ft., $5,000.

Ophir.—The owners of nearly all the smelting works aro preparing their furnaces to commence operations early in the spring. New arastras are going up and the Aiken furnace attached to the Pioncer quartz mill is completed.

Stockton.—Simon's smelters on Stockton Lake, are not running at present.

Pioneer Mills.—Tho furnace is chloriding up to 80 per cent. and the amalgamation working well.

S. F. Stock Exchange Board.

San Francisco, March 21, 1872.

The sales at the Board for the week ending Wednesday the 13th inst. amounted to $4,072,-300. The heaviest trausactions were in Meadow Valley, Washington & Creole, Excelsior and Eureka Consolidated. Last week 758 tons, assaying $37 per ton, were taken from the Chollar-Potosi mine. The shipment from the Raymond & Ely from the 1st to the 15th of March aggregate $160,000; total received for the month thus far $192,675. Nearly 800 tons of ore were taken from the Hale & Norcross mine last week; 2,950 from the Crown Point, valued at $142,000, and 1,200 tons from the Savage mine, assaying $30.50. The following Trustees of the Alps Mining Co. have been elected: J. D. Fry, C. W. Fox, A. Hayward, C. S. Hobbs and E. Skerrett. On Friday, stocks were moderately firm; Saturday a little more active; Monday and Tuesday still active; and Wednesday and to-day the market was rather weak; almost all kinds sold lower.

Consignment of Californian Pears.—We have often had to direct attention to the magnitude of the fruit trade of this city and the enormous distances from which in many cases the Glasgow market is supplied. A hetter illustration of this could not possibly he adduced than the fact that on Saturday Mr. Thomas Davis, of the Bazaar, received a consignment of pears grown in Sacramento, California. The pears are of the Easter Beurre kind, and arrived in very good condition. The Easter Beurre is a magnificent species of pear, being twice or three times the size of our Jargonelle, of excellent flavor, and so well adapted for keeping that, notwithstanding the lateness of the season and the distance over which it has travelled, the fruit looks as fresh as if it had just heen plucked from the tree.—*North British Daily Mail of Feb.* 3d.

Wastage of the Precious Metals—No. 4.

BY ALMARIN B. PAUL.

[Written for the PRESS—Concluded.]

We boast of our mechanical and scientific skill, our 22 years experience, our great discernment and independent action, and yet are bowed down by our grandfathers' ideas of working gold ores, and, on the average, do not extract 50 per cent. of the riches contained therein. Is there not a contradiction in our boasts, when compared with results?

Some will say, it is all well to talk about loss of metal, but how can we prove it, and where is the remedy?

I will tell you how to prove it, but each must work out his own remedy. For my part I have worked out the loss by what I consider the remedy—dry amalgamation—but our subject now is loss, not remedy. To awaken the mind for improvements, and he interested in a remedy, miners must first realize their loss. I contend there are several ways of working our gold ores better than the one now universally used in California. If you want to get a clear comprehension of your loss, take say 5 tons or more—not less. Reduce the ore *dry* through say No. 20 wire cloth screens; mix all thoroughly, then spread it out upon a floor about two inches thick. Lay it out in 12-inch squares, take a smaller quantity from each square, take samples thus obtained, and again mix them. Again spread out say one inch thick, laid out into 4-inch squares, taking a smaller portion from each. Reduce this sample to powder; if too much for average assays, sample again as before. Get 3 or 5 assays from reliable assayers, average the assays. Work your ore by your mill process; compare the results with assays; and in nine cases out of ten every one will find they possess more riches than they thought they had. Any other system of testing is unreliable. Pieces of rock can be had to assay more or less as you want. To get at the value of your mine, the testing of *tons* by this mode is the only safe one. It is troublesome, and these "old time" gold miners, who have got it all, don't want to be troubled. The less bigoted ones, however, may find time and take an interest in doing so, and receive, I doubt not, a pleasurable lesson. As I happen to be in the unfortunate position of trying to benefit the pursuit in which I take the most interest studying, I will receive it as a favor, if parties who should make any tests as the value of their ores in connection with the loss, will send me the results of any experiments. I said "unfortunate position," as I clearly realize the fact that it is unfortunate for any one to start out of the old beaten track, or to show the least enterprise, outside of "interest;" for by so doing he too often becomes the prey of those—

> "Whose hungry maws are only bent
> On the fine feast of cent. per cent."

The closer we investigate the question of loss of the precious metals, the more astounding are the facts disclosed, the millions upon millions that have been allowed to escape from our hands can only be estimated by the amount produced. That all the fault of loss may not be laid on gold miners, I will now present some facts connected with silver mining, taking a few of the prominent, and most efficient cases of working on the Comstock lode, as evidence of what the loss is in the best class of mills, working on the best ore. By this means the reader can form some idea of what the loss is likely to be in this poorer class of mills and on ores less easy to manipulate. From the statistical tables now before me of the Hale and Norcross Co., I find that in one year 28,000 tons were worked, producing $1,135,220, with a loss of $762,516, The product of 14 mills, all working for several months on Comstock ore, was $816,977, while the assay value was $1,288,132.

It will thus he seen hy the most unquestionable statistics that the best of the Comstock mills do not average over 65 per cent., though some claim, but have not kept statistics to prove it, that they have worked up to 75 per cent. The Comstock has produced (without entering minutely into a calculation), about $140,000,000, making a loss of over *fifty millions of dollars in less than twelve years*. As corroborative evidence of the loss hy mill working in general, is the fact that the working over of tailings has grown into quite a business, the product of which in a measure lessens the percentage of loss for amount worked, hut the quantity retained is small in proportion to the amount of ore reduced; so that a deduction of 5 per cent. on gross loss will probably give full credit for that which is produced hy re-working.

It is a very singular fact that in no portion of the State of Nevada, are the ores as pure as those of the Comstock lode, and as all are worked on the same plan as the Comstock, their percentage of value is much less—excepting in cases where furnaces are used and no expense spared to purify the metal. I am speaking only of mill ores. The reason of this low percentage, is that lead, copper or antimony, in all their various combinations as sulphurets, carbonates and chlorides, is more or less intermixed with the ores, vitiating the mercury, and thus rendering amalgamation difficult. In gaining percentage in silver working, the question of expense is more to be considered than gold. The ores of Nevada, in fact I may say silver ores everywhere occur in such a multiplicity of combinations that it requires more skill, science and experience to manipulate them, than gold, and yet the percentage on the whole, is above that of gold working in California, showing, as I assert, that our system of silver mining is ahead of our gold mining. In silver districts, about every locality has its own peculiar combination of base and precious metals, which combination exacts respectful consideration, or great loss is the result. To be just, we must admit, that while some mills working on very troublesome ore do not produce over 35 per cent., there are few mills, as before remarked, working regardless of expense on rich ores, which do produce on the average as large as 85 per cent.

There is one marked difference, too, in our gold and silver mining, and that is, a clearer knowledge of what the loss is—if only 30 per cent. is obtained, they know it and seek to better it. The system of sampling ores, and the careful assaying of the same, is carried on now in nearly all the Comstock mills to a commendable degree of exactness, which is not only highly important in a statistical point of view to those interested directly, in a pecuniary way, but is of general value. This is worthy of imitation in California, hut, at the same time, no such correctness can he expected in gold, as in silver; for the reason, that silver is more universally disseminated in the ores, while gold is less so, and as one portion may have a small particle more than another, its greater value when multiplied into tons, often render erroneous values. It is only hy great care with a number of assays, that correct values can be obtained in general working. Tests, such as given in my last, are more to be relied on. The silver mills of Nevada surpass the best gold mills of California in order, system, neatness, expansiveness and of course expense—hut that expense pays. There are mills there costing over one million of dollars and but few less than $25,000, while the average will reach as high as $80,000 possibly $100,000.

If a California gold miner, who has not had experience out of his own State, should visit the best works of Nevada, he might he much benefitted hy what he saw, and possibly become less conceited of the perfectness and vastness of California mining. At all events he would be satisfied that there was something yet to do at home. There is one thing in favor of Nevada, that for silver mining she has had full command of capitol, while gold mining has had to hold its own the best it could; but let more interest be manifested in gold and it will in every way come fully up to the standard. With this I will close, although I could write more on the same subject, with a multitude of facts, setting forth the loss daily taking place—wealth which we all would like to handle, and are much in need of in the present condition of business. It is to be hoped at least, that the facts concerning these losses will he more closely investigated, all of which will rebound not only to individuals, hut to the general good.

I will not say hy what system it can he remedied. The point is *save the metal*, our home necessities demand it. The National debt demands it, trade and commerce demand, and above all the sciences and spirit of the age, the onward march of civilization demands it. With a great influx of the precious metals, comes a corresponding activity in trade and commerce, with their buoyancy comes a higher standard of intelligence elegance, and refinement. Our wasteful system is lahor, without reward, a more careful one, is wealth for industry. Let us remedy the evil, by doing it we can build homes for the poor. Do it, and there need he no poor, where there is muscle. Do it. Then begins the Golden Era of America, the splendor of which, like the noon day's sun, will give warmth, activity and good cheer to all.

ALABAMA has six cotton factories, which work up 20,000 bales of cotton annually.

The Badger.

The badger is a clumsy animal, with short, thick legs, and is nearly related to the hear. It is of the genus *meles*, and is found in Europe, Asia and North America, and is sometimes called the ground-hog. It is indolent, solitary, sleepy, and generally considered a stupid animal, feeds mostly on vegetables, and hy night. With its powerful claws it excavates deep and commodious hurrows, in which it remains during the day time. He seldom leaves his retreat at all during the severe winters of the north.

The word hadger is from *bloda*, the Latin for corn. This animal was called *bladarius*, by the Latins, because he carried away the corn from the fields of the farmers. So in every land, one who buys corn in one place and carries it to another to sell is called a badger.

The traveler on the wide prairies of Nebraska, Iowa and Kansas, and along the great thoroughfares of the Rocky mountains, often meets the hurrows of this animal. He is also found occasionally on the Atlantic Coast as far north as Labrador, which has given its name to a species of this animal peculiar to that locality.

The badger sometimes leaves his retreat in the day time. A traveler on the west-

ern plains relates the following incident: "We once surprised as many as five in a single day—two of them in company, as if upon a journey. We kept them before us for more than three miles—whenever they attempted to escape, we would rush upon them—when they would turn and fight most savagely—retreating backwards and contesting every inch of the ground in the retreat; and often rush at horse, man and dog in so determined a manner—that we were obliged to fall back—as we did not wish to kill them. After more than three miles fighting and retreating, they seemed to he in the latitude of home—as they made a sharp turn to the left, and came near reaching their hurrow; hut were killed not a rod from its mouth. From this circumstance as well as many others under our observation, we are led to believe that the hadger is given to making visits to far distant friends, or is sometimes of a wandering disposition."

The hadger can live many days without food or water; and even at the end of a three weeks fast has been known to give a most determined fight to a dog. The one which we have chosen for our illustration is one of the varieties peculiar to this continent, and is known as the *melis Americana*.

LIGHTING STREETS.—Since her reconstruction, Paris—always a city of municipal elegancies—has introduced a new and improved method of lighting her streets. We quote from a letter to the Philadelphia *Press* the following: "One novelty since the war is the use of a new electric gas for lighting the streets. Nearly all the half-circle of the Boulevards, on the Louvre side of the Seine, is not merely lighted hut illuminated in this manner. I do not know how this gas is produced, but it has all the brilliancy of a Bude light, and the cost is inconsiderable. In a short time, no doubt, every street in Paris will he lighted in this manner, with very little expense. There cannot he an explosion, it is stated, and as for an escape of gas that does not matter, as this is inodorous. It would he worth while for the ruling powers to send a Commissioner or two over to Paris to inquire into this new system of street illuminations. For domestic use—that is, in dwelling houses—the intensity of the light may be objectionable. In the open air, however, this is an advantage.

American Wonders.

The greatest cataract in the world is the Falls of Niagara, where the water from the great upper lakes forms a river of three-quarters of a mile in width, and then, being suddenly contracted, plunges over the rocks in two columns, to the depth of one hundred and seventy feet.

The greatest cave in the world is the Mammoth Cave in Kentucky, where any one can make a voyage on the waters of a subterranean river, and catch fish without eyes.

The greatest river in the world is the Misssissippi, 4,100 miles long.

The largest valley in the world is the valley of the Mississippi. It contains 500,000 square miles, and is one of the most fertile and profitable regions of the globe.

The largest lake in the world is Lake Superior, which is truly an inland sea, being four hundred and thirty miles long and one thousand feet deep.

The longest railroad in the world is the Pacific Railroad, which is over three thousand miles in length.

The greatest natural bridge in the world is the natural bridge over Cedar Creek, in Virginia. It extends across a chasm eighty feet in width and two hundred an fifty feet deep, at the bottom of which the creek flows.

The greatest mass of solid iron in the world is the great iron mountain in Missouri. It is three hundred and fifty feet high and two miles in circuit.

The largest deposits of anthracite coal in the world are in Pennsylvania, the mines of which supply the market with millions of tons annually, and appear to be inexhaustible.

Iron.

Five years ago, Illinois did not produce a ton of pig metal. Last year she made 65,000 tons.

Last year Missouri mined 268,800 tons of iron ore, and Michigan 910,985 tons.

Nearly one-third of the pig metal produced in the United States, is made from Michigan ore.

Illinois, as a rail-producing State is second only to Pennsylvania.

About 3,500 tons of 'black ore' is mined in Clay county, Indiana, every day, part of which is sent to St. Louis.

One mill in Wisconsin, places that State fifth on the list of rail-producing States. It made 25,774 tons, last year.

Michigan made nearly 100,000 tons of pig metal, last year, against 900 tons in 1854.

The Missouri ore companies are prepared to put 500,000 tons of ore in the market, this year.

The manufacture of rails in this country, has just doubled in the last six years.

The year 1872 opens on a very small stock of iron throughout the world. In the United States the aggregate is lower than at this period for many years, and the product of the furnaces for 1872 is largely contracted for. In England prices have been steadily advancing for several months and the stocks of finished iron increasing, until the scarcity there equals that here. In both, and, in deed, all countries, the various branches of manufacture are fully employed. The completion of projected undertakings, and the prosecution of new ones, will demand greater supplies than the production of 1872 will meet, and we may, consequently, look for higher prices.—*Ex.*

THE WING OF THE LOCUST.—If the tip of the wing of the so-called "seventeen-year locust," is placed under a low magnifying power, there will be seen near the fancied letter W (which has been observed hy some with superstition) a beautiful branching, arborescent appearance, which is probably due to certain vessels which supply nutriment to the wing. The branches are transparent, and are based on one of the muscular hands of the wing. They appear to be filled with some granular material. Why they appear only at this one spot on the wing has not been explained.

LARGE ARMOR PLATES.—A firm in Sheffield, England, have just lately succeeded in rolling the largest armor plates ever made. The plates are intended to protect the turrets of the great war ship Devastation, which is being built at Portsmouth. Each plate weighs twenty-four tons and measures twenty feet in length, nine feet in breadth and eight inches in thickness.

Useful Information.

Oatmeal and the Intellect.

At the annual meeting of the American Association for the Advancement of Education, recently held in this city, Professor Haldeman advocated the use of high phosphorized food for teachers, they having much expenditure of brain. He said "the reason why the Scotch were so intellectually acute and active must be attributed to the use of oatmeal in their youth. Oats contain more phosphorus than any other vegetable." He also recommended eggs as excellent food for teachers, in order to increase their intellectual capacities. But the mental acuteness and general intellectual strength which characterize the people of the above-named country cannot be due to the phosphorus of their oatmeal, which is their common breakfast food, for it so happens that wheat contains more of it than oats. The quantity of soluble phosphates in wheat, according to Professor Johnston—himself a Scotchman—is more than one per cent. greater than in oats. In his work on Agricultural Chemistry, pages 503 and 510, the composition of wheat and oats is given in tables.

Oatmeal is, no doubt, very excellent food for man and beast, and so is Indian cornmeal, but neither of them will confer intellectual acuteness upon any man. Dull teachers or dull men cannot be made philosophers either by the use of eggs or oats. We must look to some other cause than oatmeal for the metaphysical mind of the North Britons. That cause is, no doubt, to be found in their education. Common schools have been in existence in that country for two centuries, and the strict family training of children by catechisms being similar to that which use to prevail in New England, and various other parts of our country. The Welsh, the Norwegians and Irish use oatmeal extensive for food.—*Sci. Am.*

Patent Lunacy.

The *Railroad Guide*, in a very sensible article says: There is no more melancholy sight than a man afflicted with this mania—which in many of its aspects closely resembles the passion for gambling—who is poor and dependent upon his daily exertions for the support of himself and family. He has constantly before him the vision of affluence, and with it the pangs of poverty. Experience teaches often in vain, and one failure only seems to gild the brighter the next vagary of invention. We know of men who for years have spent all the time and money they could control to develop and bring into use inventions which it was quite easy to demonstrate would be practically useless. These same men, if remonstrated with for thus following a constantly losing career, are always ready to justify themselves by citing the great inventors whose beginning were equally discouraging and whose ultimate success was nevertheless most brilliant. Alas! if those who reason thus would only study, among other things, logic, so that they might see that because some inventors were in the beginning poor and had a hard time generally, but succeeded in the end, it does not therefore follow that all who exercise the inventive faculties in the midst of penury will emerge ultimately into success and affluence.

The Mysteries of a Hair Brush.—A writer in the *American Journal of Microscopy* has been exploring the forests of bristles in a hair brush surreptitiously purloined from a lady's toilet stand, and though it contained nothing which we are accustomed to regard with unqualified horror, the results of his investigations prove that there are mysteries ordinarily undreamed of in simple appliances of the toilet. There are concealed in the damp lint of hair brushes, unless kept clean by the use of bicarbonate of potassa or carbonate of soda, many living things, too small for detection by the naked eye, some of which, we are told, are of more than suspicious character, being known as the originators of scaldhead and other diseases of the scalp. The author concludes his article by a caution against wetting the head, recommending dry brushing instead. He also recommends the use of a weak solution of carbonic acid or sulphate of soda as a cleaning material for hair brushes.

The telegraph cable from Java to Australia has been successfully laid.

Japanese Tea.

A Japanese handbill, which we have found in a package of tea, from Hewes & Richards, reads thus:

"They are both kinds; Yeesay and Sanging; it is the name of the mountain; there very much foggy cover the top of the mountain to the foot are constantly. There quality are superior and genuine. Any person who was feeling indisposed may try take a cup of it in a few morning, and will feel much better and good spirit. With expressly packed for Imperial. By Foohing & Co., Yokohama."

This handbill is evidently written by a Japanese and it gives us an idea of Japanese progress in learning our language. Evidently the scholar has confidence that he can make himself understood, and in this he is not mistaken. We learn something from it that may be useful to us. This tea is presented as a superfine article, and its superiority is attributed to the foggy mountain-side on which the tea plants are grown. This suggests that our coast range elevations may be adapted to tea culture.

California experience in tea planting has been so interrupted by untoward circumstances, that a fair trial has not been made. All we have proved is that the plant will thrive if it arrives here in good condition—better one year old than more; and that it must be irrigated in summer. The seed will also germinate, and it is preferable to transplanting. But the tea nut is very oily. The oil even gets rancid and the nut is useless. Be sure, therefore, of your seed before you plant it. We are not certain that palatable tea can be made here. Change of climate often changes properties. Herr Schuell's samples from El Dorado tea plants were not decisive on that point.—*Alta.*

Immunity of the Pig From Injury by Serpent Bites.—The impression is generally prevalent in the United States that the common domestic pig is an especial enemy of all kinds of serpents, and that it is capable of receiving the bite of the rattlesnake and copper-head without the slightest personal inconvenience or injury. This same immunity from harm would seem to exist in other countries, as a late writer in the London *Field* remarks upon the fondness of the pige in India for the cobra de capello, and states that he has repeatedly seen them in conflict, and has observed the pig to be bitten over and over again in the snout and about the face by the writhing reptile, and in no instance with the slightest ill results to the aggressor.

Blue Glass for Greenhouses.—We find that Robert Buist, Sr., indorses the use of blue glass in greenhouses and other structures for forcing plants, etc. In a communication to *Tilton's Journal of Horticulture* he says:

I applied a coating of Prussian-blue paint, six inches wide, up the center of each row of panes; the result was electric, and in a few days the plants assumed their beautiful green color, and the trusses of bloom came to maturity. The greenhouse had been used to grow geraniums for bedding purposes, but they had lost their color every year about the first of April. The plants were completely rejuvenated by the blue glass.

Colored Candle Light.—Wax candles are made of different colors, but they all emit a white light. Why may not candles be manufactured, by introducing certain chemicals into the material from which they are made, so as to show a variety of colors, such as blue, red, green, etc.? By arranging such candles in tasteful groups, beautiful effects may be produced in illuminating buildings. If some ingenious chemist will devise a way of embracing a cheap chemical with any of the material used for illuminating candles so as to render the light emitted from them of any desired color, he will make a fortune by his discovery.—*Commercial Bulletin.*

Guinea Gold. — The French *Journal Official* says that gold production is rapidly increasing in the French colony of Guiana, of South America. The annual product has enlarged from 25,974 francs in 1856 to 1,685,643 francs in 1871. The product between 1856 and 1869 amounted to over ten million of francs. Gold mining industry in Guiana pays an annual tax of about twenty cents per acre, and an export duty of four per cent. upon bullion. The industry promises to attract to these tropical regions a numerous and energetic population.

Good Health.

Poisonous Exhalations.

Poisonous exhalations from drains are a far greater source of mortality than is generally supposed. Prince Albert, consort of Queen Victoria, no doubt came to his end from such a cause, and the heir "apparent" has just been snatched from the jaws of death, to which extremity he was undoubtedly reduced by breathing the exhalations from a defective drain. If all the guards that are usually thrown about royalty, fail to secure immunity from such exposure, what are we to expect in humble life, when, from necessity exposure is often knowingly submitted to. Only two or three weeks since the English mail informed us that a large number of operatives in a factory in Preston, England, became suddenly ill, and had to cease work. Several had already died, and others were not expected to recover. An examination showed that they had been working over a defective drain. No doubt the list of mortality is largely swelled by such cause, operating in unknown ways and quarters in every large city in the world, to say nothing of less populous neighborhoods. It is time that the public was taught to have more regard to such dangerous exposures in less populous neighborhoods. It is time that the public was better informed with regard to the danger from such exposures, and that more attention was paid to the drainage system of our cities and houses by those have who immediate official authority in such matters. Defective drainage and impure milk, lead to more deaths than any other ten or a dozen causes combined.

The Cause of Whooping-Cough.

The germ-theory of disease, which some pathologists seek to extend so widely, has been applied by Dr. Letzerich to explain the extremely infectious disease, whooping-cough. He thinks he has discovered a form of fungoid growth which vegetates in the air-passages, and by its irritation causes the convulsive attacks of coughing. The expectorated mucous in patients suffering from this disease is said to contain masses of brownish red spores with occasional threads of mycelium, which in later stages of the disease become very abundant. The spores are colored blue by iodine and sulphuric acid. These observations were controlled first by cultivation of the spores on pieces of bread soaked in milk, and further, by introducing masses of the fungous growth thus obtained into the trachea, of young rabbits. This was effected by tracheotomy, but the animals rapidly recovered from the effects of the operation, and in a short time became affected with a cough of a very violent and noisy character; in fact, a genuine whooping-cough. The rabbits thus effected were killed, and their air-passages and lungs found to contain an enormous quantity of the same fungous as that met with in the sputa from human whooping-cough; and, in fact, the mucous expectorated by the rabbits showed precisely the same appearance.—*Miscroscopical Science.*

Care of the Feet.—Concerning this subject the *Scientific American* very truly says: "Many are careless in the keeping of the feet. If they wash them once a week they think they are doing well They do not consider that the largest pores are located in the bottom of the foot, and that the most offensive matter is discharged through the pores. They wear stockings from the beginning to the end of the week without change, which become perfectly saturated with offensive matter. Ill health is generated by such treatment of the feet. The pores are not repellant but absorbent, and this fetid matter, to a greater or less extent, is taken back into the system.

The feet should be washed every day with pure water only, as well as the armpits, from which an offensive odor is also emitted, unless daily ablution is practiced. Stockings should not be worn more than a day or two at a time. They may be worn one day, and then aired and sunned and worn another day, if necessary.

Ammonia as a Cure for Snake Bites.—As many as 8,000 persons die annually, in British India and Burmah, from the effects of snake bites. The Inspector of Police to the Bengal Government now reports that of 939 cases, in which ammonia was freely administered, 702 victims have recovered, and in the cured instances, the remedy was not administered till about 3¼ hours after the attack, on the average. In the fatal cases, the corresponding duration of time was 4¼ hours.

Physical Development.

T. W. Higginson has taken pains to compare the vital statistics of several generations of two old New England families, and he finds to the dismay of those who mourn the physical degeneracy of woman since the days of our great grandmothers that the stock has improved, if anything. He adds:

No man of middle age can look at a class of students from our older colleges without seeing them to be physically superior to the same number of college boys taken twenty-five years ago. The organization of the girls being far more delicate and complicated, the same reform reaches them less promptly, but it reaches them at last. The little girls of the present day eat better food, wear more healthful clothing and breath more fresh air than their mothers did. The introduction of India-rubber boots and water proof cloaks alone has given a fresh lease of life to multitudes of women who otherwise would have been kept housed whenever it so much as sprinkled. It is desirable, certainly, to venerate our grandmothers but I am inclined to think on the whole that their great-granddaughters will be the best.

Big Sunday Dinners.—A Sunday's dinner is made the most sumptuous meal of the week in a great many households, and the guests retire from the table more like gorged anacondas than intellectual human beings, with the result that during the whole afternoon there is such an amount of mental, physical and religious sleepiness, if not actual stupidity, that no duties whatever are performed with alacrity, efficiency, and acceptableness The Sunday dinner made of a cup of hot tea, some bread and butter, with a slice of cold meat, and absolutely nothing else, would be wiser and better for all; it would give the servants more leisure; the appetite would be as completely satisfied half an afterward, while body, brain and heart would be in a fitting condition to perform the duties of the Sabbath with pleasure to ourselves, with greater efficiency to others, and doubtless with larger acceptance to him toward whom all our service is due.—*Hall's Journal of Health.*

Exposed Arms.—A very distinguished Paris physician says: "I believe that, during the twenty years I have practised my profession, twenty thousand children have been carried to the cemeteries, a sacrifice to the absurd custom of exposing their arms. Put the bulb of a thermometer into a baby's mouth and the mercury rises to ninety degrees. Now carry the same to its little hand; if the arm be bare and even cool, the mercury will sink to fifty degrees. Of course, all the blood that flows through these arms must fall from ten to forty degrees below the temperature of the heart. Need I say, when these currents of the blood flow back to the chest, the child's vitality must be more or less compromised? And need I add that we ought not to be surprised at the frequently recurring affections of the tongue, throat, or stomach? I have seen more than one child, with habitual cough or hoarseness, entirely relieved by simply keeping the hands and arms warm."

Singular Death.—Mr. E. C. Chambers, the Park street station agent of the Medforth branch of the Boston & Maine railroad, met with his death in a very singular way, some days since. His little daughter was sick with the diptheria, and he put his hand on her mouth for some purpose or other, and the child seized upon his hand and bit it. The marks of the teeth were very slight, comparatively, but the skin was broken slightly, and the poison from the teeth was transmitted through Mr. Chambers' system, and after a week's illness, during which his body became much swollen, he died.

The prospects of medical education for women are brightening. The medical faculty of Moscow, Russia, it is stated, have not only decided that the privilege of acquiring a thorough medical knowledge would be of utility to women, but have "resolved to admit them to the educational courses and lectures of the University, and to the privilege of following all the labors of the Medico Chirurgical Academy."

Cundurango has had a fair trial at Bellevue Hospital, New York, and has proved a failure.

Cure for Diptheria.—A simple treatment of diptheria may be found in the use of lemon juice. Gargle the throat freely with it, at the same time swallowing a portion, so as to reach all the affected parts.

San Francisco:

Saturday Morning, Mar. 23, 1872.

Gold and Legal Tender Rates.

San Francisco, Wednesday, March 20, 1872.—Legal Tenders buying 91⅜; selling, 92. Gold in New York to-day, 109¾.

Table of Contents.

Editorials.—The Mining Incorporation Bill; State Geological Survey, 177. Increase of Taxation; Guano, 181. Notices of Recent Patents; Arizona Affairs; Recent Publications, 185.

Illustrations.—Pelton's Improved Horse-Power, 177. The Badger, 182. Table Mountain, 184. Residence of Col. Black, Bozeman, Montana, 185.

Correspondence.—Notes of Travel in Yuba and Nevada Counties; Mines at Phillipsburg, Montana, 178; Wastage of the Precious Metals—Concluded, 182.

Mining Summary.—Reports from Mines in various States, Counties and Districts; Stock Reports; Markets. Etc., 180-1.

Mechanical Progress.—New Mode of Transmitting Rotary Motion at Angles; Utilizing the Rivers of France; Improved Axle-boxes; Diamond Toothed Saw; Improved Iron Rails; Effective Work of Steam Engines, 179.

Scientific Progress.—New Method of Nickel Plating; Phosphorescence of Animals; Primordial Fauna in Nevada; Agricultural Resources of the Great Basin; Masses of Meteoric Iron, 179.

Useful Information.—Oatmeal and the Intellect; Patent Lunacy; The Mysteries of a Hair Brush; Japanese Tea; Blue Glass for Greenhouses; Colored Candle Light; Guinea Gold, 183.

Good Health.—Poisonous Exhalations; The Cause of Whooping Cough; Care of the Feet; Physical Development; Big Sunday Dinners; Exposed Arms; Singular Death, 183.

Domestic Economy.—Hints to Poor Housekeepers; A Good Way to Cook Meat; Cleaning Soiled Marble Slabs; Canary Birds; To Clean Lamp Chimneys; Substitute for Bed Blankets; Why Some are Poor; Potash vs. Rats.

Mechanical Hints—A New Metal; To Make Varnish that will Imitate Ground Glass; Brittleness of Drawn Wire; Impurities of Gold, 187.

Miscellaneous.—Progress of Silver Mining in Montana; Fauna; A Rival to Tea and Coffee; Iron Paper; Fencing, 178. Lighting Streets; American Wonders; Iron; The Wing of the Locust, 182.

Volcanic Specimens.—Among the late additions to the cabinet of Mr. H. G. Hanks, No. 649 Clay street, is a case of lavas, etc., from the Sandwich Islands and from other volcanic regions. The specimens comprise stalactites and stalagmites from the cave of Kilauea, sulphur crystals, lava with sulphur coating, and with gypsum coating, Peles hair, pumice, red and black scoriae, etc. The specimens from the Sandwich Islands were recently sent here. The volcano from which they came, Kilauea, on the Mauna Loa mountain, is the largest in the world, rising 9 miles in circumference, and 6,000 feet above the sea.

Giant Powder Strikes.—The "strikes" occasioned by the use of Giant powder in the Grass Valley mines have come to an end. A meeting of the Miners' Union was held on the 15th inst., and after some discussion on the subject the following resolution which appears in the *Union*, was passed:

The Miners' Union at an adjourned meeting held last evening, resolved that it no longer obliges its members to avoid the use of Giant powder."

W. E. Reed, President.

Wastage of the Precious Metals.—Mr. Paul requests us to state that if any of our subscribers desire the article on the above subject in pamphlet form, that they may have the same, free of expense, by forwarding address to A. B. Paul, 318 California street, in this city.

Fossil remains of great size have been found on Wagner Creek, Wagner County, Oregon.

Increase of Taxation.

The question of taxation has become one of serious import, and notwithstanding our plain and supposed economical habits, there is no country where this burthen is making greater inroads upon the general industry and earnings of the people than in these United States. In 1860 our National expenses, including interest on the public debt, were confined within the limits of $75,000,000. In 1871 they had advanced to $186,000,000, exclusive of all moneys paid out on account of national debt and interest. Including the latter class of payments, the total footed up $411,000,000—or $10.42 to each man woman and child in the Union. It will be seen from the above, that the ordinary expenses of the general government increased 148 per cent. in eleven years.

Contrasted with Great Britain.

The expenses of the English Government for 1851, including the interest on her immense national debt, were, in round numbers, $273,000,000. During the next two decades they had increased to $348,000,000—or only 27 per cent. in 20 years, against 148 per cent. by the U. S. government in 11 years. The percentage of increase noted in the expenses of the U. S. government is exclusive of payment on both interest and principal of our war debt; while the percentage of increase in the expenses of the English government includes the added cost of interest on the debt created by the Crimean war. The *per capita* expenses of the English government is $11.60; but when it is borne in mind that a large portion of this expense is employed in keeping up and protecting her immense colonial possessions, the population of which is not taken into account, but from which both the government and people receive indirect benefit, it will be seen that the *per capita* tax bears no proportion to the magnitude of that of the United States.

The local taxation of England and Wales for 1868—corresponding to our State and county taxes—including the poor rates, was $83,916,000, or $3.87 per capita, against $10 to $15 for the local taxation in several of the States of the Confederated United States.

State Taxes.

The State taxes for New York increased three fold during the decade from 1850 to 1860; and from $18,000,000 to $50,000,000 during the last decade. Massachusetts, which paid $7,600,000 of taxes in 1861, raised $21,900,000 in 1869—an increase of nearly 300 per cent. in about eight years, and a per capita of about $15.60. Of course our state taxes have been very much increased since the war, in consequence of annuities paid to disabled soldiers and for other extraordinary purposes growing out of the war of rebellion. They are moreover largely increased for school purposes, an item which does not enter into the element of English taxation. But still the facts of the terrible and increasing burthen of taxation remains to hinder our industry and general national prosperity. The increase of local taxation was generally about as great for the decade preceding the war as for the last decade, and is altogether out of proportion to the increase of population.

Municipal Taxation.

We give below the per capita rate of taxation for the cities mentioned:

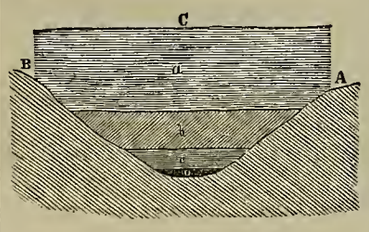
Boston, per capita.....	$36.10
New York " "	29.54
Chicago " "	21.65
London, including poor rates.....	5.85
Montreal, " " "	5.23

In the cities of London and Montreal, there is, of course no tax for education, which in those cities is made an individual expense. If this tax was added to the rates of those cities it would increase them about $3.00, or $8.85 and $8.23 respectively.

There are many other things besides the mere detail of dollars and cents in our system of taxation to which attention is being drawn. The conditions, irregularities and absurdities which characterize the various systems adopted by the different States and the United States for raising revenues, are utterly surprising and inconsistent with the reputation which the American people sustain for general intelligence and practical character. This matter is now being prominently placed before the country by a board of commissioners, appointed by the Governor of the State of New York, under authority of the Legislature. Their report has already been published, and the year has produced few public documents of half its importance or general interest, or one which has more astonished the reading and reflecting people throughout the commercial centers of our Atlantic sea coast. So much general interest has attached to the document that, as we have seen it stated, the Harper Brothers of New York have proposed a special edition of the report for extended circulation.

Table Mountain.

The Table Mountain of Tuolumne County is a flow of basaltic lava extending for a distance of nearly forty miles in a northeast and southwest direction from Murphy's, Calaveras County, to the foothills of the Sierra Nevadas on the borders of the San Joaquin valley, near Knights' Ferry, Stanislaus County. The greater portion of this remarkable landmark is situated within the limits of Tuolumne County. The mass of lava of which it is composed, naturally found a depression in which to flow and in doing so covered up the ancient river where the auriferous gravel is found. The denudation and erosion of the surrounding country has totally changed and reversed its topography. The former banks of the river have been washed away, leaving the lava stream standing in the position it occupied during the flow—its hight above the modern stream, the Stanislaus, being nearly 2,000 feet. When the existence of this river bed became known, the miners immediately went to work by tunnels, shafts and inclines and have been ever since extracting the precious metals from the gravel which lies under the deposit of lava. The Geological Survey have given a detailed description of the peculiar character of this mountain, which is very interesting as one of the striking features of the topography and geology of the State and also as showing the surprising changes which have taken place there, caused by volcanic overflows and remodelling of the surface of the country. The tendency of the channel has been to work to the east. May not this account for the existence of the rich placers on the limestone belt, on which are situated the towns of Jamestown, Sonora and Columbia.



Mr. W. A. Skidmore during a recent trip through our State collecting material for the Mining Commissioners' Report, took barometrical observations of the altitudes of several points, which may be interesting to our readers. An observation taken on Main street in Copperopolis, Calaveras Co., establishes the elevation at 998 feet above sea level. Chinese Camp, Tuolumne Co., 1,290 feet; Jamestown, same county, 1,382 feet; Sonora, 1,720 feet; Shaw's Flat, 2,148 feet; Columbia (estimated) 2,200; Summit of Quartz Mt., Tuolumne Co., 1,624.

The observations taken at Table Mt., near Jamestown, Tuolumne Co., are particularly interesting, for by the accompanying diagram it will be observed that this rim rock of the ancient river is 33 feet higher on the west side than on this east.

The observation taken at A was made at the hoisting works of the Table Mountain Co.'s claim, on the eastern side of Table Mt. (formerly known as the "Humbug" claim) 87 feet above this rim rock of this ancient river, covered by the lava flow known as Table Mt.: elevation 1,680 feet.

Observation B was made at the hoisting works of Hughes' mine, on the west side of the mountain (formerly known as the Maine Boys' Tunnel) 110 feet above the rim rock of the ancient channel: elevation, 1,736 feet. This claim is next adjoining and south of the Table Mt. Tunnel Co.'s ground.

Observation C was taken on the summit or plane of Table Mt. and at a point equidistant from observations A and B—elevation 1,882 feet.

The above diagram of a cross section of Table Mt. is a representation of the stratification at this point: *a* is the basaltic lava rising in precipitous cliffs from the surrounding country; *b* a strata of compacted sand nearly hard enough to be designated as sandstone; underneath this is a layer of gravel, represented by *c*; and *o* shows the position of the auriferous gravel.

The auriferous gravel is extracted by means of inclines running respectively from *A*, and *B*, to the bottom of the channel, a distance of 320 feet.

At the bottom of the inclines, drifts are run up and down stream and the channel "breasted" for a width of from 30 to 100 feet, and a hight of 4 to 6 feet; the best pay lies on the bottom. There are two channels—so called—underlying the mountain, the most easterly being the most recent—geologically speaking. The gravel at present taken out varies in yield from $2.50 to $5 per car load of 16 cubic feet. A run of several months at the latter figure would, however, be considered as exceptionally rich. The gravel is not cemented and is more readily treated than that of the northern counties. The method of treatment here is by use of the "Cox Pan." One of these pans will treat 40 car loads per day.

Guano.—What is it? It is only until lately that any question has arisen as to the character of guano. It has heretofore been universally supposed to be the excrement of birds and the remains of those which have died. But of late this same substance has been found on the bottom of the ocean, and at considerable depths. It has also been found under circumstances which tend to show that it is a *mineral*. Following up this hint, Dr. Hahel has been studying it by the aid of the microscope, and finds that so much of it as is insoluble in acids consists entirely of skeletons of diatomaceæ, sponges, etc., all of which are universally of marine origin, and none of which, in their present form, could ever have formed from or in the excreta of animals of any kind. Patches of these remains have been found exactly as they occur in Nature. From these and other facts there appears to be but little doubt that guano is an accumulation of the bodies of animals and plants—not their excreta—which, either by heat, by chemical action, or both combined, has had its organic matter converted into bitumen, while the mineral constituents have been preserved in those beautiful forms which make up the infusorial strata in various parts of the world.

Rewarded.—The Cresson medal of the Franklin Institute has been awarded to Mr. R. C. Tilghman for his discovery of the uses of the sand blast.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co's. Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

Safety Lamp.—Emil Boesch, San Francisco. This improvement relates to that class of argand burners in which the flame is regulated by turning the outer case of the burner, and it consists in a novel arrangement for regulating the flame by turning this case without raising or lowering the chimney, and by this means the relative position of the chimney and the flame which is so essential to excellence in these burners, is maintained unchanged. The lamp is also provided with one or more ducts or passages either of which may be used for conveying the gas which may be formed in the oil holder, to the central tube which feeds air to the flame, so that the gas and air will be mingled previous to their coming in contact with the flame, and by this means all danger of explosion from an excess of gas in the oil holder will be averted.

Dish Washing Machine.—Catharino Woodruff, Antioch, Cal. This invention relates to an improved machine for washing dishes and consists mainly in. the employment of wire racks for supporting the dishes and partitioned baskets of the same material for the different kinds of dishes. It also consists in the use of a revolving agitator which throws the water forcibly through the meshes of the racks and baskets, thus thoroughly cleansing the dishes in a short time.

Grain Thresher and Separator.—Joseph Esse, Rodwood City, Cal. The object of this invention is to provide an improved arrangement of devices for more thoroughly threshing and cleansing wheat and other grains, and it consists in the use of two or more thresbing cylinders and their concaves in succession. It also relates to an improvement in the straw-carrying devices, and finally to a novel shoe and screens for cleansing the grains after it is threshed.

Recent Publications.

We have received from Roman & Co., 11 Montgomery street, a very neatly bound volume of "Half-hours with Modern Scientists," containing a discourse on the Physical Basis of Life by Huxley; the Correlation of Vital and Physical Forces by Barker; as regards Protoplasm — Reply to Huxley, by Stirling; On the Hypothesis of Evolution, by Cope, and Scientific address, by Prof. Tyndall, on the method and tendencies of physical investigation; On Haze and Dust; and on the scientific use of the imagination. The work is neatly printed and the names given above are sufficient guarantee that the contents will be interesting to all who have a taste for scientific investigation.

A little volume containing two sermons, by President Woolsey of Yale College, on "Serving our Generation, and God's Guidance in Youth," comes with the compliments of the same publishers, as does also the "Elementary Music Reader," which consists of a progressive series of lessons which have been prepared expressly for use in the public schools by B. Jepson, instructor of vocal music in the New Haven public schools. The latter work is marked Book First and another one is to come. It is a revised series containing a number of songs set to music and is intended as an elementary guide to the study of vocal music.

We are also under obligations to Henry Carey Baird the Industrial Publisher, 406 Walnut street, Philadelphia, for a copy of "Guettiers' Metallic Alloys." It is a practical guide for the manufacture of metallic alloys; comprising their chemical and physical properties with their preparation, composition and uses. The work is translated from the French of A Guettier, engineer and director of foundries, and author of "La Fonderie en France," etc., by A. A. Fesquet, chemist and engineer. It contains general observations on the metals which are commonly used for alloys; physical and chemical properties of alloys; their preparation and composition; those most used in the arts; those of iron with copper, zinc, tin and lead; alloys of metals of secondary importance in the arts, of precious metals; of metals rarely used in the arts; bronzes of art; alloys for coinage; for pieces of ordnance, arms, projectiles, etc.; for rolling and wire drawing; for ship sheathings; for type, engraving plates, etc.; for bells and musical instruments; philosophical and optical instruments; for jewelry, gold and silver wares, Brittania wares, etc.; white alloys; fusible alloys; those for machinery, anti-friction metals, etc.; solder and miscellaneous alloys. The work is classified under different heads and will be found a useful and convenient reference for all matters concerning the subjects of which it treats.

Arizona Affairs.

The people on this coast have been naturally indignant at the manner in which the Government has acted with regard to Indian affairs in Arizona, and desire that some definite steps be taken to ensure safety for the lives and property of individuals in that Territory as well as in other parts of the United States. When General Crook went there he immediately started in upon a plan which his Indian-fighting experience suggested and one which was kindred to the feelings of the people he was protecting. His plans have been frustrated, however, by the policy of the Government in sending more "Peace Commissioners to do the business in some way, so that some official may make a little money out of the matter. These proceedings are obnoxious to the people of this Coast and we are glad to see that the Legislature of California has taken the matter in hand, passed a series of resolutions and sent them on to the President.

The preamble sets forth the facts that inhabitants of Arizona are now and have been for some years victims to the outrages of the Apaches, and that hundreds of them including women and children have been killed; that life and property are not safe there, and that the nation should enforce protection to its people living under its own flag as well as those in other lands. One clause reads thus:

"That for the murder of the fewest number of citizens who have been slain by these savages in Arizona in any two months during the last two years, the United States Government would have declared war against every power in Europe, had its citizens been so murdered there for want of proper protection from European powers."

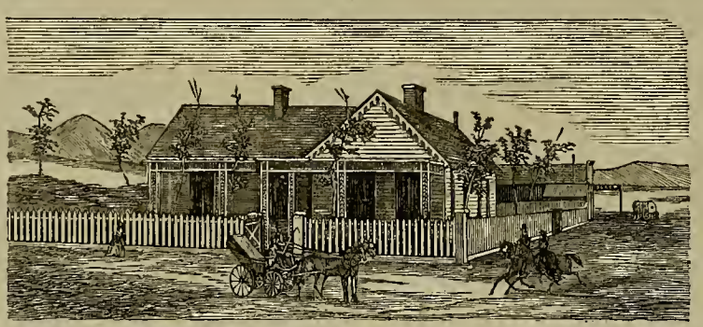
General Crook's course is commended, and it is believed that he will if let alone, in a short time give security to the people in the Territory. The resolutions state that all attempts to treat with or otherwise appease the Indians will be futile until they are made to feel the power of the Government; that the protection of the citizens can in no way be so promptly and efficiently extended as by furnishing General Crook with ample means and large discretion on the course to be pursued towards the savages. The President of the United States is urged to prevent further interference with the military affairs of General Crook, otherwise than by aiding his designs, until the Indians are subdued. The Senators and Representatives from our State are requested to urge upon the Government such action as the regulations indicate.

If proper cognizance is taken of the resolutions by the authorities at Washington we may at last hope the Indians will be made to sue for peace and that they will receive a wholesome lesson from the hands of General Crook, that they will be likely to remember. Business of all kinds has been retarded long enough by the Apaches, and it is high time that the whites had their turn in dictating terms of peace.

Settlement and Development of the Gallatin Valley.—Concluded.

[By our Travelling Correspondent.]

Col. Black saw that tenement accommodations in Bozeman City were insufficient—immediate expansion was evidently a necessity of the town. Other local capitalists hesitated to invest in buildings while they could get 3 per cent. a month on their money in other channels—the prevailing interest rate in Eastern Montana. They would prefer purchasing ground and letting it lie unimproved if they could not loan at that figure. Thus they would take from, without directly adding to the general wealth. No such a cramping, strangling policy as this found countenance from Colonel Black. Bozeman needed more house, and he at once bought a large tract of land lying contiguous to Main street, and began the work of building. All the carpenters in the country were put to work, and the sawmills were taxed to their utmost capacity. Now, Black street, Boze-



RESIDENCE OF COL. BLACK, BOZEMAN, MONTANA.

man, is one of the finest residence avenues of the frontiere, some of its structures being of a character that would be creditable to any city; and it gratifies me to be able to say, every finished house is occupied, and those unfinished are all engaged. Besides these improvements, Col. Black has caused the erection of and owns some fine buildings on Main street. His own residence, represented in our cut, is a neat and modest little cottage, situated on the street which bears his name. The house is in a pleasant location, and back of it is the warehouse where goods are stored for distribution to the Indians of the Yellowstone.

The enterprises of Col. Black is not confined to Bozeman—it embraces the whole of Eastern Montana. In the Yellowstone Valley—three years ago a forbidden region to white men—he has a large mercantile house, and another in the Musselshell Valley, further north. And he is now giving his attention to the opening of a wagon road from Bozeman City to the mouth of the latter stream, which it is thought will virtually give the metropolis of Eastern Montana control of the navigation of the Upper Missouri.

Fort Ellis.

Another powerful influence in inducing settlement and development in the Gallatin Valley was the establishment, in the fall of 1867, of the military garrison of Fort Ellis, at the mouth of Bozeman Pass, three miles southeast of Bozeman. And thus, too, was the General Government at last forced to acknowledge the necessity of having called into the field the Territorial militia, which, indeed, had been done by the express order of General Sherman. After the establishment of Fort Ellis the settlers pushed forward their enterprises with greater confidence, feeling that in the future they would enjoy the fruits of their industry in peace and security; and a steady tide of immigration again set in, stimulating all branches of industry. From that time forward the history of the Gallatin Valley, if we except an occasional Indian "scare" in the most exposed places, has been a career of uninterrupted prosperity. The garrison opened a new and nearer market for the products of the farm, and has had much to do with making Bozeman as it now is, and for the last four years has been, one of the best cash vegetable and dairy markets in the Territory; it seemed to open a demand for the surplusage over and above what was called for by the miners and trappers scattered along the Yellowstone, so that since then only flour, grain and bacon have been shipped in large quantities from the Gallatin Valley to the more distant mining camps.

Early next spring Fort Ellis is to be increased from a four-company to a twelve-company post—orders for more extensive barracks, with that object in view, having already been promulgated. The garrison, thus increased, will undoubtedly be permanent for several years, or until some time after the completion of the Northern Pacific Railroad, as it is the natural base for all military operations between eastern Montana and the Dakota border. And when, finally, the necessity of maintaining it shall have passed away, the Gallatin producer will have an inexhaustible market in the development of the contiguous mines of gold, silver, copper and iron.

The Pick and Plow.

The settlement and development of the Gallatin Valley was materially assisted by the establishment at Bozeman city in 1869, of the Montana *Pick and Plow*, a well printed journal, with H. N. Maguire, a journalist well and favorably known throughout the Territority, as editor. The *Avant Courier* as successor to the *Pick and Plow*, has a local patronage enjoyed by but few mountain journals. Capt. Joseph Wright, one of the best printers on the frontier, and a good writer is the conductor of the *Courier*, while Mr. Maguire, the projector of the *Pick and Plow*, finds a more congenial field for his energy in the real estate business.

A General View.

Now let us take a general view of the condition of affairs in the Gallatin Valley. Between five and six hundred farms are under as high state of improvement as could be expected, considering the time they have been cultivated, many of them boasting thriving young orchards and first-class barns and dwelling houses. Maguire's Bozeman Land Agency is crowded with applicants to make additional land entries. In the last year the property valuation of the county has almost doubled; in the last year and a half the population of Bozeman has nearly trebled; and permanent settlements are rapidly being made in the adjacent valley of the Yellowstone. I have frequently spoken through your columns of the general productiveness of those regions; no better quality or more bountiful yields of wheat, oats, barley and rye, or root crops, are produced anywhere in the temperate zone. That the great Northern Pacific Railroad will traverse the Yellowstone and Gallatin valleys within the next three years is no longer doubted.

Gallatin City

Is situated in the Gallatin Valley at the confluence of the Jefferson, Madison and Gallatin rivers, which form the headwaters of the great Missouri. It was first settled by a band of 60 men in 1864. The banks of the rivers are covered with the most luxuriant vegetation, furnishing an abundance of food for stock. Fair grounds are laid out adjoining the city. It is probable that the Northern Pacific Railroad will pass through the town and follow up the Jefferson river. A water power flour mill is situated in the town, owned by Geo. D. Thomas; it is run night and day, and during last fall turned out 7,000 sacks of flour. It is a great convenience to the farmers near by and does its work well. The average yield of wheat in this vicinity is 30 bushels per acre. Major J. B. Campbell is one of the oldest settlers in this country and owns some very fine stock. His daughter Fanny has had enterprise enough to locate 160 acres of land adjoining the town, and having complied with the requirements of the law now holds possession of it in her own name. This is a somewhat novel idea for the fair sex, but her example has already been followed by Miss Ray, who raised 60 acres of wheat last year on a place of her own.

Eastern Montana is to-day the objective point of colonies which are being organized in, Missouri, Illinois and other Western States and the increase of population the present year will undoubtedly be greater than that of the last two preceeding years. But there is little danger of the field being soon overcrowded. It is estimated that the main Gallatin Valley will alone support a farming population of fifteen thousand. There is still in Gallatin County, I am assured, over half a million acres of the best of farming lands, subject to entry under the homestead and pre-emption laws.

W. H. M.

The Overland for April contains articles of more than ordinary merit. The contents embrace Sea Studies; A Ride through Oregon; South Sea Bubbles; Three Days of Sanctuary; The Northern California Indians; Evelyn; Wants and Advantages of California; In the Shadow of St. Helena; Exhumed; Yosemite Valley in Flood; Juanita; Abigail Ray's Vision; Sam Rice's Romance, and Transition. The book notices and "Etc." are as usual, good.

The Michigan Southern R. R. Co. have ordered 131 locomotives, twenty of which are to be built at the Taunton works, twenty-three at Manchester, N. H., twenty-six at the Rhode Island works, and the others at New York and Paterson, N. J.

The Marysville Foundry is making six Little Giant nozzles for Dutch Flat; they are constructed so as to stand a pressure of 400 feet fall of water and weigh over 1,000 pounds each.

Domestic Economy.

Hints to Poor Housekeepers.

The duties of housekeeping do not occupy all the time of women who keep from one to a half dozen servants. Almost every housekeeper tells about heing drivon with care. Many complain that servants are the pest of their lives, the ourse of housekeeping.

In the faco of all this it is safe to holieve that a good mistress makes good servants, and to act upon that belief.

Those who fully understand how to systematize house-work, and to practice all the practical ecouomies of time, strength aud expense iu each department, have very little trouble with help.

The irregularities of a household do more to spoil a good servant than auything else.

Late to breakfast, lato to diuner, late to supper, each taking their own time, aud straggling in to eat alone, requires many more steps; and taxes the patience of dining-room girls. For there is grumhliug about bad coffe, cold toast and hard beefsteaks, when everythiug was palatable when first cooked.

Where such habits are permitted, the washing and ironing drag around all the week, keeping girls in the vapors and discouraged. It is all very well that you "hire a girl to do your work, no matter at what time of day it pleases you to have it done"—if you allow a family of six or eight to leave things topsy turvy, one or two girls cannot follow them to keep things in order, hesides doing justice to the other duties of housekeeping.

A great trouhle is that girls are compelled to be both mistress and maid through ignorance of their superior officers.

"Do you wish your clothes rubbed through two waters?"

"Do you use washiug fluid, Ma'am?',

"Shall I use flour or sale starch for dresses?"

"What shall I get for breakfast?"—and all such questions requiring a positivo and intelligent answer directing girls how things shall he done.

But many womon answer "Do the washing as you havo been accustomed to do it. Get what you please for breakfast, only let it be something good"—giving girls free sweep in the kitchen, to waste and cause twice the expense they should, if it happens to be their custom.

Some women call that housekeepiug.

One of Dickens' characters is a woman who has seasons of striking terror to tho hearts of her household hy putting ou gloves and tying her head up in a rag, to storm around and givo things a thorough going over and dusting up—ill temper being the invariahle accompaniment of such bursts of industry.

That character is the representative type of quite a class of housekeepers. It would be far hetter if their iudustry did uot come in streaks. If they would exercise a little of it every day, it would prove a benefit to themselves and those around them.

Kindness to servants and a disposition to help them along make things go smoothly.

Working people have hearts, and those who best appreciate that fact aro the ones who make most friends among them.—*Pomeroy's Democrat.*

A Good Way to Cook Meat—Is to seal it in a vessel hermetically tight. Cooked thus a long time in its own juices, it is rendered very tender, and has a peculiar appetizing flavor. Take an earthern jar that will stand heat, with a tight fitting cover. If beef is to be the dish for dinner cut in convenient pieces, lay them in the jar, rub each piece with salt and pepper and a little sugar, put in a little water; lay on a piece of thick buttered paper, and press down the cover. If you think it will allow any steam to escape, mix short or rye meal with water to a paste; press strips of this all round the edge of the cover. Bake iu a moderate oven four or five hours according to tenderness of meat. Chickens or turkeys, are excellent cooked in this way. The toughest old hen can be rendered toothsome by this process.

To Pickle Meat in One Day.—Get a tub nearly full of rain or river water and put two pieces of thin wood across it and put the beef on them, distant ahout au inch from the water. Heap as much salt as will staud on your beef and let it remain twouty-four hours; then take the meet off and boil it, and you will find it as salt as if it had beeu in pickle for six weoks, the water haviug drawn the salt completely through the beef.

Cleaning Soiled Marble Slabs.

Much annoyance is frequently experienced by the soiling of marble tahle tops or other marble objects, and a perfectly satisfactory method of removing such stains is a desideratum. It is said that if slacked lime be mixed with a strong solution of soap into a pasty mass aud spread over the spot in question, aud allowed to remain for twenty-four to thirty hours, then carefully washed off with soap aud water, and finally with pure water, tho stain will he almost entirely removed, especially if the application be repeated once or twico.

Another preparation consists in mixing an oxgall with a quarter of a pound of soap-boiler's lye, and an eighth of a pound of oil of turpentiue, aud adding enough pipe-clay earth to form a paste, which is then to be placed upon the marble for a time, aud afterward scraped off, the application to be repeated until the marble is perfectly clean. It is quite possihle that with all our endeavors a faint trace of the stains may be left; but it is said that this will be almost inappreciahle. Should the spots ho produced by oil, these are to be first treated with petroleum for the purpose of softening the hardened oil, and the ahove mentioned applications may be made subsequently.

Ink spots may be removed by first washing with pure water, and then with a weak solution of oxalic acid. Subsequent polishing, however, will be necessary, as the luster of the stone may become dimmed. This can he best secured by very finely powdered soft white marble, applied with a lineu cloth first dipped in water and then into the powder. If the place he suhsequeutly rubbed with a dry cloth the luster will be restored.—*Western Rural.*

Canary Birds.—Haug the cage always where drafts do not strike the bird. Give healthy birds canary and rape seed, plenty of fresh water, cuttle fish bone, and clean gravel ou the bottom of the cage often. Also, give the hirds fresh water to hathe in every day. After they have bathed remove the dish, which should be shallow. Never have the room overheated. At night, when the fire has gone down, if it is very cold, throw a thiu cloth over the cage. A little pepper occasionally regulates them. Do not give them cake or sugar. When moulting, feed them on rape seed slightly moisteued. Hard boilod egg and cracker grated are excellent. Bad seed will kill hirds. Cabhage and sweet apples are good for them, and now and then a fig. With moderate care the little songsters will ropay your attention with sweet notes of joy.—*Western Rural.*

To Clean Lamp Chimneys.—When you wish to clean a lamp chimney hold a liuen cloth against one end of the chimney and place the other end in your mouth, breathe iu it uutil it is covered inside with moisture, push the cloth iuto the ohimney with a smooth slender stick and rub it around until the moisture is absorbed, repeat tho process and breathe over the outer surface also, ruh this with a cloth until dry and you have a clean, bright chimney as the result. This method saves time, labor and patience, and gives a result highly satisfactory; soft newspaper will take the place of a liuen cloth—do not use cottou cloth on any glass-ware.

Substitute for Bed Blankets.—Here is a hint for housekeepers, and a very important one. Merely coveriug up a bed with blankets and counterpanes will no more protect it from dampness or keep it dry than a pane of glas will keep out light. The atmospheric moisture will penetrate all woven fabrics. Hence the importance of keeping the beds in spare rooms regularly aired. Many a dear friend or welcome visitor has been sent to an untimely grave, or afflicted for life with disease by being put into a bed which had been permitted to stand unoccupied. Keep the spare beds, when not in use, free from all covering but a light spread.

Plain Apple Pudding.—Pare, quarter and core apples to fill a small dish rather more than half, and pour in water two inches deep. Make a crust of one pint of flour, one-half teaspoonful of salt, and bakiug powder enough to make it light. Add a level teaspoonful of lard, and flour enough to make a wet dough, and roll it out quickly, put over tho pudding dish, and place ou a hot stovo. Cover tightly with a tin cover on which put a flat irou. The steam produced cooks the pudding quickly. Fifteen minutes will he found long enough. Serve hot with hard sauce made of butter and sugar.

Why Some are Poor.—Cream is allowed to mold aud spoil. Silver spoons are used to scrape kettles. The scruhhing hrush is left in the water. Nice-haudled kuives are thrown in hot water. Brooms are never hung up, and soou are spoiled. Dishcloths are thrown where mice cau destroy them. Tubs and harrels are left in tho sun to dry and fall apart. Clothes are left on the line to whip to pieces in the wind. Pie crust is left to sour iustead of making a fow tarts for tea. Dried fruit is not taken care of in season, and becomes wormy. Vegetables aro throwu away that would warm for breakfast. The cork is left out of the molasses jug, and the flies take possession. Bits of meat are thrown out that would mako hashed meat or hash. Coffee, tea, pepper and spices are left to stand opeu and lose their strength. Pork spoils for the want of salt, from floating on top of the brine, and because the hrine wants scalding.—*Ex.*

Potash vs. Rats.—A gentlemau of large experience, and claiming to he as humane as the rest of us, communicates to the *Agriculturist* tho fact that he rids his premises of rats by putting potash in their holes aud runs. The poor wretches get it over their feet and fur, theu thoy lick it, and dou't like the taste of it; it burns them somewhat, and the more thoy see of it the less they liko; and so they clear out almost as soon as the application is made. To get rid of mice, the same person uses tartar emetio, mingled with any favorite food; they take it, take sick, and tako their leave.

A Winter Evening Desert.—In the wiuter, when there has heeu a fall of light suow, tho following makes a delightful dish for desert and refreshmonts during the long winter evening (wheu the stove is hot): Take of the thickest sweet cream you cau get, oue pint; to it add ouc teacup full of white or light sugar, beat well togethor, then add euough cloan dry suow stirring well all the time, to mako it the consistency of ice cream; add flavoriug of lemon, vanilla, strawberry or raspberry syrup made for the purpose.

Puddings and Pies.—Dr. Hall says that puddings and pies aro considerod unhealthful, hocause, beiug eaten after we have made a full meal of other things, the stomach is oppressed by them, and, if the process is repeated, becomes eventually dyspeptic; that is, has not powor to work up the food, hecause it has been "worked to death" already. It would be quite as philosophical to say, he asserts, that if a mau has becomo very tired by plowiug all day, and afterwards by chopping wood had "worked himself out," it was very unhealthy to chop wood.

Mechanical Hints.

A New Metal, au alloy of which the composition is only known to the discoveror, has been compounded. This metal is said to resemble gold in color, ductility, and malleability. It does not tarnish nor is it affocted hy dampness. From its lesser cost aud superior qualities it is expected that it will to a great extent supercede brass.

To Make a Varnish that will Imitate Ground Glass.—Mr. J. Garratt has favored us with the following:—To make a varnish to imitate ground glass dissolve 90 graius of sandarac and 20 graius of mastic in two ounces of washed methylated ethor, and add, in small quantities, a sufficiency of benzine to make it dry, with a suitable grain—too little making the varnish too transpareut, and excess making it crapy. The quantity of heuzine required depends upon its quality—from an half ounce to an ounce and a half or even more; bnt the hest results are got with a medium quality. It is important to use washed ether, free from spirit.—*British Journal of Photography.*

The Brittleness of Drawn Wire may be ohviated in a short time by subjecting it to a glowing heat or it losses this at the ordinary temperature within two to four months.—*Oesterreich. Ztschr.*

In Order to prevent the ebullitiou of boiling liquids a small fragment of sodium amalgam or of sodium tin, is added, when the solution is acid. The efficacy of these depeuds on the evolution of a small amount of hydrogen during the process.—*Dingler's Polytech. Journal.*

Impurities in Gold.—Slight traces, even the 1-1900 of lead, antimony, bismuth or arsenic, render gold crystalline and hrittle; these impurities may be removed by chloriue. Silver from aucient graves iu the Island of Cyprus was fouud to he brittle in consequence of changes in its molecular conditiou in the course of centuries.—*Polytech. Central-Blatt.*

H & L AXLE GREASE.

The attention of Teamsters, Contractors and others, is called to the very superior AXLE GREASE manufactured by

HUCKS & LAMBERT.

The experience of over twenty years, specially devoted to the preparation of this article, has enabled the proprietors to effect a combination of lubricants calculated to reduce the friction on axles, and thus

Relieve the Draft of the Team,

Far beyond the reach of any who have hut recently gone into the hueiness; and as the H & L AXLE GREASE can ho obtained hy consumere at ae

LOW A RATE

As any of the inferior compounds now being forced upon tho market hy unprincipled imitators, who deceivo and defraud the coneumer.

HUCKS & LAMBERT

Invite all who desire a First-clues and Entirely Reliable Articlo, and which for Over 18 Yeare in this country hae given such General satisfaction, to ask for the H & L AXLE GREASE. See that the trade mark H & L ie on the red cover of the package, and take no other.

Phelps' Patent Animal Trap,

FOR GOPHERS, SQIRRELS, RATS, COYOTES, and other "Varmints."

Thie Trap, as may he eeen, is of simplo construction and not likely to get out of order, and very durahle.

It is Very Efficient

and can he used conveniently hy women or children. THE CHEAPEST AND BEST YET INVENTED. Price 50 cents. By mail, prepaid (to places where oxprese charges aro high), $1. A liheral discount to clubs or dealers who buy by the dozeu. Address the inventor aud manufacturer, D. N. PHELPS,

al-1y-awhp Sau Leandro, Alameda County, Cal.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating oree, they have no equal. No effort has been, or will he spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so ae to apply steam directly into the pulp, or with steam hottome, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the centor, where it is drawn down through the apporture and hetween the grinding eurfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as hefore. Thue it is constantly passing a regular flow hetween the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpahle powder, and the metal amalgamated.

Setlers made on the eame principlo excel all others They hring the pulp eo constantly and porfectly in contact with quicksilver, that the particles are rapidly and completely ahsorhed.

Mill-men are invited to examine theee pans and eetlere for themselvee, at the office, 229 Fremont Street, San Francieco.

AMBLER'S BLOWPIPE FURNACE,

For Roasting Rebellious Ores.

Thie new roasting furnaco ie the CHEAPEST AND BEST yet offered to the public. By furnishing an ample supply of oxygen to the ore while roasting, thorough oxydization of the sulphurete ie secured at a small cost.

It is Adapted to All Kinds of Ores.

A description and illustration of this Furnace was given in the Scientific Prese of November 25th.

For terms, circular, and further information, address the agent of the inventor,

MONROE THOMSON,

At 444 California street, San Francisco, until further notice. 5v23-3m

The California Powder Works
No. 314 CALIFORNIA STREET,
SAN FRANCISCO.
Manufacturers and have constantly on hand
SPORTING,
MINING,
And BLASTING
POWDER,
Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.
We have been awarded successively
Three Gold Medals
By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.
We also call attention to our
HERCULES POWDER,
Which combines all the force of other strong explosive now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other compound now in use.
A circular containing a full description of this Powder can be obtained on application to our Office.
16v20-3m JOHN F. LOHSE, Secretary.

Mineral Lands.

A euit in equity has heen instituted in the U. S. Circuit Court, hy Proeecuting Attorney Letimer, against J. F. Houghton and E. H. Miller, Jr., to eet aside letters patent for lande in Siskiyou county on the ground that they were mineral not agricultural lande. The complaint allegee that on the 14th of Dec. 1868, Jamee F. Houghton, not heing a eettler upon the lends hereinafter described, epplied to the Land Office of the United States for the Lend District of Humboldt, to make entry of and purchase at private sele of the following described parcels of pnhlic lande, sitneted in the county of Siskiyou: Southeast querter of eection 20, northeast qnarter of section 29, the northwest eection of quarter 28, and the southwest quarter of section 21, ell in townehip 47, north of renge 6, weet Mt. Diahlo hase and meridian, containing 640 acres. That the entry was allowed hy the Register and Receiver of the Land District, and the eaid entry and purchase wes made by Houghton.

On the 11th of Septemher, 1869, United States letters patent were issued to Houghton for the enid parcele of land. The hill states that theee lands were at the time Houghton applied to enter the seme, and ever since have heen and now are, mineral lande of the United Statee, containing veluehle gold deposits; that for more than twenty years the lands have heen eettled upon and occupied hy persons engaged in mining in and upon seid lands, that the mineral character of the lande has heen well known and notorioue during all the time it has heen settled upon and occupied; that as early as 1850 there was located and huilt npon the southeast quarter of section twenty the town of Cottonwood, which etill doee exist and etand upon the locality aforeseid, where trade and commerce are cerried on, and where many persone resided and still reeide, engaged in mining and mercantile pureuits; that in consequence of the minerel character of the lands they were wholly unfit for cultivation and agricultural purposee, and were not suhject to private entry or purchase.

The complaint further statee that Houghton knew at the time he applied for, entered, and attempted to purchase enid lende, that they were mineral lande and occnpied as euch, and wholly unfit for cultivetion and agricultural purposes; thet his applicetion to enter the seid lands was knowingly, falsely and fraudulently made, with the intention of securing the title to said lands; that the officers repreeenting the United Statee were deceived hy Houghton, and that their acte were done unadvisedly and through mistake.

It states further thet Houghton has refused to return the United States patent, and that he hae transferred the same to E. H. Miller, Jr., who has now the same in hie poseesion; that Miller knew when the transfer wee made, that the lands were cleesed ae mineral lands, and had notice of the fact thet they were not in the market. The bill prays that the letters petent he decaired to he null end void and for euch other relief as the Court may seem proper to grant.

New Incorporations.

The following have filed certificates with the County Clerk, San Francisco.

American Tobacco Co.—March 12. Object, to cultivate and deal in tohacco in its various forms and to purchase, hold and deal in patents and licenses. Capital stock, $250,000 in 25,000 shares. Trustees: Joseph W. Stow, Joseph Brandenstein, J. A. Drinkhouse, J, D. Culp, Wm. L. Hoover; place of business, San Fransisco.

Ohio Con. G. M. Co.—March 12. Location: West Point District, Calaveras county. Capital stock $2,500,000, in 25,000 shares. Trustees: W. G. Wayman, A. Bateman, Ben. Dore, Geo. O. Ecker and Joseph Fulton.

Schell Creek M. Co.—March 18. Location: Schell Creek Mining District, White Pine county, Nevada. Capital stock, $5,000,000, in 50,000 shares. Trnstees—Wm. T. O'Neal, E. M. Hall, W. T. Robinson, F. Vassault, J. B. Overton. Place of bnsiness, San Francisco.

Ivanhoe S. M. Co.—March 18. Location: Ely District, Nevada. Capital stock, $3,000,000, in 30,000 shares. Trustees—Wm. Norris, George D. Roberts, George C. Shreve, R. A. Swain, Tyler Curtis. Place of bnsiness, San Francisco.

Vincent M. Co.—March 19. Location: Camp Floyd District, Utah. Capital stock, $2,500,000, in 50,000 shares. Trustees—W. B. Payne, E. Vassault, S. H. Howard, P. M. Van Winkle and H. L. Lightner.

Condor S. M. Co.—March 19. Location: Ely District, Lincoln county, Nevada. Capital stock, $2,500.000, in shares of $100 each. Trustees—J. D. Fry, Jesse S. Wall, George A. Treadwell, Wm. H. Sears and William Cline.

Maggie M. Co—March 20. Location: Lincoln county, Nevada. Capital stock, $2,500,000, in 2,500 shares. Trnstess—George A. Treadwell, William Blanding, John W. Shaw, J. B. E. Cavalier and William L. Ryckman.

Tobacco Culture.—The tohacco crop of Connecticut has come to he one of the first importence. It is raised in almost all parts of the Conneoticut valley. Hertford county alone is said to have produced $4,000,000 worth last year. One mau realized over $12,000 from the product of only seveu acres. The tobacco raised in thet region now commands a much hetter price then it did two or three years ago—in moet ceses nearly or quite twice as much. The value of the article raised there is now freely acknowledged hy manufacturers and it is bought in large quantities to go out of the State for manufacture.

Farmers are generally increesing their crops hy plenting more land, and many that never hefore engeged in the busiuese are now planting largely. The tobacco produced there is not only a superior article, hut the yield is also very large. Both of these facts are the result of careful tillage and thorough dressing of the soil. Stahle manure has been found by experience to be the heet fertilizer.

The ahove facts should operate as a stimulue to Californians. The few experiments that have been made in this State have heeu very euccessful, hoth in quelity and amount of yield, end we are pleased to etate thet the indications now are that tohacco will soon become au important item of farm product in Celifornia. We notice that 1,000 acres near Gilroy is to he planted with tobacco this season, and that large areas are to he planted in many other sections of the State.

Agricultural Enucation. — An esteemed correspondent deprecates the indifference manifested hy our State Legislators and hy the people generally in the matter of egricultural education. We fully agree with him in the necessity for more interest in this matter, but fail to see how it can he brought ahout by estahlishing an egricultural school in every county until we cen get eomething like a fair attendance and interest in the *one* echool already established in the very heert of one of the best agricultural counties in the Stete. Something of the plan he suggests has been put in practice iu the most densely populated portions of Germany, and may eventually he made practical in some portion of this coutinent; but not until the country is filled up with manufacturing enterprisee which will furnish so good a home market for our agricultural productions that an individnal can make it more profitahle to devote his entire time to the cultivation of five acres, than to epread himself out over a hundred or more. Our correspondent's suggestion that agricultural text books should be prepared and introduced into our common schools is a good one. The general principles of agriculture should be made as much a regular hranch of etudy in our schools as natural philosophy, astronomy or English grammar even.

PACIFIC RURAL PRESS
EDITED BY
DEWEY & Co
PUBLISHERS SAN FRANCISCO
A FIRST CLASS
Agricultural Home Journal

It is one of the Largest, best Illustrated and most Original and Enterprising Agricultural Journals in America, and has no rival on the western side of the Continent. Its circulation is Rapidly Increasing, and it is Very Popular with its Patrons.

A NEW HUSBANDRY,

as it were, is required on the Pacific Coast, on account of its peculiar seasons, soil, climate and topography. The new discoveries, ideas, and useful hints evolved in its rapid progress, are to be observed with interest, and read, as reported in the Pacific Rural, with profit by practical and progressive agriculturists everywhere. Sample copies of the Press, post paid, 10 cts. Subscription, $4 a year.

DEWEY & CO., Publishers,
No. 338 Montgomery St., San Francisco, Cal. Nov., 1871

Change of Form.—With the commencement of the New Year, Crofutt's Western World was enlarged to 16 page—64 columns—of the same size and shape as Harper's Weekly, of N. Y., or the Scientific Press, of San Francisco. This change is demanded by the pressure of important information constantly collecting in our hands. Its advantages for the better arrangement of reading matter will be obvious at a glance to our subscribers.—*Publisher of the Western World.*

The above $1 monthly is being advanced with the enterprise and originality characteristic with the publisher of the most interesting guide hook ever printed in America. Its office is at 138 Nassau street, New York.

Our Printed Mail List.

Subscribers will notice that the figures found on the right of the pasted slips, represent the date to which they have paid. For instance, 21sp70 shows that our patron has paid his subscription up to the 21st of September, 1870; 4j72, that he has paid to the 4th of January, 1872; 4j73, to the 4th of July, 1873. The inverted letters (¼ ½, etc.,) occasionally used are marks of reference, simply for the convenience of the publishers.

If errors in the names or accounts of subscribers occur at any time an early notice will secure their immediate correction. Please notify us if you are not properly credited within two weeks after paying.

☞ *Postmasters, please send corrections also.*

Our Agents.

Our Friends can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Wm. F. Spencer—California.
W. H. Murray—General Traveling Agent.

Designing and Engraving

By the Best of Artists, At this Office.

HINTS FOR INVENTORS. We will send on receipt of stamp for postage, FREE, our 52-page Circular, containing 112 Illustrated Mechanical Movements; a digest of PATENT LAWS; information how to obtain patents, and about the rights and privileges of inventors and patentees; list of Government fees, practical hints, etc., etc. Address DEWEY & CO., Publishers and Patent Agents, San Francisco.

Longshore's Combination Tool.

This device is just what its name indicates. As a Kitchen Tool it is indispensable. It will fit and lift with perfect safety, any Stove Lid, Frying Pan, Pie Pan, Pot, Kettle, or any other vessel or dish used about a stove. It is a complete tool for stretching carpets, driving tacks, pulling tacks, &c., &c. It answers the double purpose of hammer and pincers, and is also a good Nut Cracker. It is made of the best malleable iron, and the Hammer, Pincers and tack puller, are all hardened so as to stand the roughest usage. An Agent is wanted in every town on the Pacific Coast to sell this valuable little implement. Retail price fifty cents.

THE CALIFORNIA
Safety Gas Lamp.

This New Gas Lamp takes the place of the Candle, the Coal Oil Lamp and Coal Gas, and costs only

One-Half Cent per Hour.

Any person who will take the trouble to examine this Lamp carefully, will see that it will not explode.

The flame is as white and brilliant as coal gas, and produces neither Smoke nor Smell. No Chimney is Required.

It makes its own gas as fast as it is required, and when the light is blown out the gas ceases to be generated.

One Burner is Equal to Six Candles.

This Lamp burns Refined Petroleum, Gasoline, Danforth's Oil or Taylor's Safety Fluid. Oil expressly prepared for the Lamp furnished by the undersigned in quantities to suit. WIESTER & CO.,
17 New Montgomery street, Grand Hotel, S. F.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the Scientific Press we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Shareholders' Meeting — Office of the Eagle Quicksilver Mining Company.

In accordance with a resolution adopted at a meeting of the Trustees of the Eagle Quicksilver Mining Company, duly held on the 15th day of March, 1872, a special meeting of the stockholders of said company is hereby called, to be held at the office of the company, Room No. 5, No. 30 Montgomery street, San Francisco, California, on Monday, the 25th day of March, 1872, at the hour of 4 o'clock P.M. of said day, to elect two Trustees to fill vacancies in the Board, and for the transaction of such other business as may lawfully come before it. WM. H. WATSON, Secretary.

San Francisco, March 16th, 1872. mar16-2t

Kincaid Flat Mining Company—Location of works, Tuolumne County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 14th day of February, 1872, an assessment of three dollars per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Sec'y, at his office, No. 220 Clay street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 18th day of March, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 8th day of April, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Trustees.

R. G. CORNELL, Secretary.

Office, 220 Clay street, San Francisco. fe24-td

Marcelina Silver Mining Company.—Location of Works: Eureka District, Lander County, Nevada.

Notice is hereby given that at a meeting of the Board of Trustees of said company held on the eighth day of March, 1872, an assessment of ten cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, Room 21, Hayward's Building, 419 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the fifteenth day of April, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the seventh day of May, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

CHAS. E. ELLIOTT, Secretary.

Office, Room 21, Hayward's Building, 419 California street, San Francisco, California. mar19-3w

Nuestra Senora de Guadelupe Silver Mining Company.—Location of Works: Tayoltita, San Dimas District, Durango, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twelfth day of May, 1869, an assessment of two dollars per share was levied upon the assessable capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, A. Blumelmann, No. 637 Washington street, San Francisco, to settle the indebtedness of the said Company.

And whereas there has been an error in the course of proceedings for the collection of said Assessment, by reason of which, as provided by law, all previous proceedings, except the levying of the Assessment, are void, and publication required to be begun anew. NOW, therefore, by order of the Board of Trustees of said Company, at a meeting of said Trustees, held on the eighth day of March, 1872, said Assessment is hereby re-published, and notice thereof given as follows, to wit:

Nuestra Senora de Guadelupe Silver Mining Company.—Location of Works: Tayoltita, San Dimas District, Durango, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twelfth day of May, 1869, an assessment of two dollars per share was levied upon the assessable capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, E. J. Pfeiffer, No. 210 Post street, or to the Treasurer, A. Blumenmann, No. 637 Washington street, San Francisco, to settle the indebtedness of the said Company.

Any stock upon which said assessment shall remain unpaid on the fifteenth day of April, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the eighth day of May, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

E. J. PFEIFFER, Secretary.

Office, No. 210 Post street, San Francisco, California.

Piermont Milling and Mining Company—Location of works, Piermont District, White Pine county, Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 25th day of January, 1872, the several amounts set opposite the names of the respective shareholders, as follows:

Namee.	No. Certificate.	No. Sharos.	Am't.
Brigge, Chae A.	15	5833½	$466 67
Brigge, Chae A.	47	111	88 80

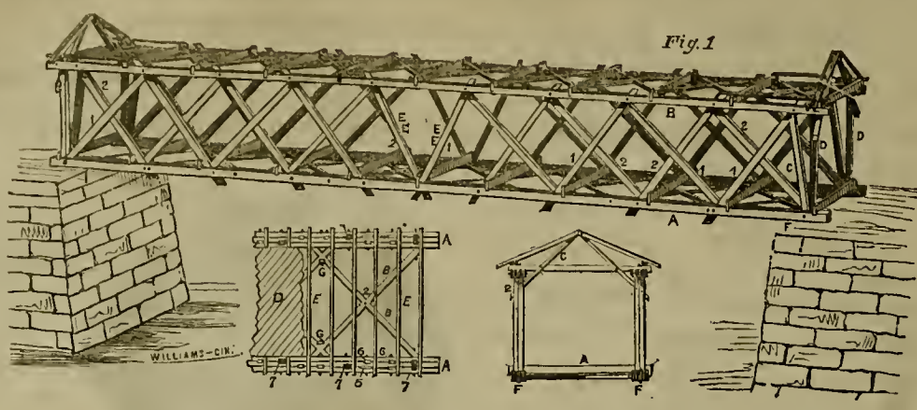
PACIFIC BRIDGE COMPANY,



OAKLAND, CAL.,

ARE PREPARED TO BUILD ALL KINDS OF WOODEN BRIDGES ON

Smith's Patent Truss Plan.

These Bridges have been thoroughly tested in the East for Three Years, and wherever tried have proved superior to any other Bridge in the following points:

Being built of wood entirely, they are not affected by change of temperature.

The timber used is placed so directly in the line of strain, that less material is required to support the same load.

It is not perceptibly affected by shrinkage. It is the most Economical Bridge built. It is adapted to any practicable LENOTH OF SPAN.

Plans, Specifications and Terms will be sent to any County, Township or Person wishing to build a Bridge, and no charge made unless the Plan is used. For all Public Bridges the Plan will always be open to competition.

Smith's celebrated CAST IRON PIER, economical, and adapted to heavy currents, built at low rates.

C. H. GORRILL, Secretary. **W. H. GORRILL, President.**

P. DAVIS' WIRE AND PICKET FENCE.

Although about two hundred different stylee of fences have been invented and patented in the United States within the past ten years, yet this Fence, for GENERAL FARM USE, etands at the head of the list. This is a Virginia invention, and the actual cost of the Fence complete in that State is lessthan fifty cents per rod. Three men can put up six hundred yards per day. Price of territory, and circular with full description of fence, sent on application.

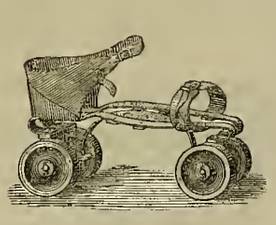
The C-Spring Roller Skate.

PATENTED 1871.



Rights and Skates for Sale.

This emperior Skate is now beginning to attract the attention of Rink Owners, it being the only Cramping Skate now before the public (except the Plympton Skate) that can run without infringing a former patent.

This Skate is Positively no Infringement

Of anybody's patent. It is made in the most substantial and workmanlike manner, and possesses the following points of merit: Beauty, Elasticity, Ease of Movement, Strength, Lightness, and does not injure the skating floor as much as the ordinary skate.

Every pair Warranted to be just what it is represented. Parties intending to

START A RINK,

Should examine and test this Skate. Sample pairs sent C. O. D. on application.

In ordering samples state the number of hoot or shoo worn, and whether for lady or gentleman.

☞ For City, County or Rink Rights, call on or address WIESTER & CO.,

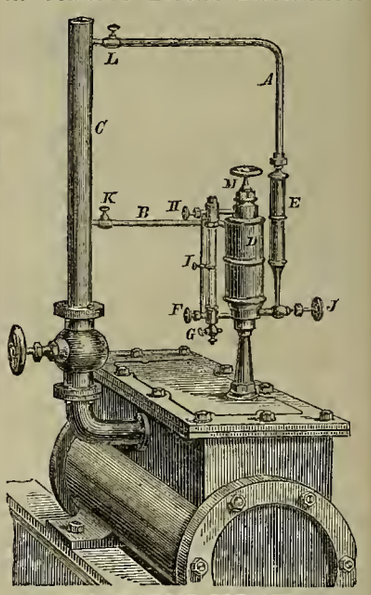
N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; L, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 2v23tf

BLAKE'S PATENT STEAM PUMPS.

WHAT IS SAID BY THOSE WHO USE THEM.

SALEM, Oregon, January 16th, 1872.

MESSRS. BERRY & PLACE, San Francisco—Gentlemen: In answer to your query regarding the working of the large Blake Steam Pump, our company purchased of you, we would say in all sincerity that the pump *has exceeded our expectation*. It has been in use since the 27th of September, 1871, and has thus far given the most perfect satisfaction. It does its work with ease, does not get out of order, and requires but little or no attention to run it. It is SIMPLE, DURABLE, and PERFECT in its construction. We have found it entirely satisfactory and just the pump *in every respect* needed for our work.

Yours, respectfully, W. F. BOOTHY, Pres't Salem Water Works.

PHŒNIX MINE, Napa County, January 16th, 1872.

MESSRS. BERRY & PLACE, San Francisco—Gentlemen: The No. 8, Blake Steam Pump we bought of you last fall is doing good service. We are having a large amount of water to contend with during this stormy weather; but the pump throws it all out of the main shaft (165 feet deep) with perfect ease, and is only working from 60 to 80 strokes a minute. It is a complete pump and no mistake. We are well satisfied with its working, and if you wish to use the name of our company, as a reference, you are at liberty to do so. Very resp'tly, GEO. FELLOWS, Supt. Phœnix Quicksilver M. Co.

OFFICE STARR MILLS, VALLEJO, Cal., January 13th, 1872.

MESSRS. BERRY & PLACE, San Francisco—Gentlemen: We are pleased to state that the No. 3 Blake Pump purchased of you, has constantly supplied our three boilers for the past year, with water heat to above boiling point with one of Armstrong's Patent Heaters. It has given us no trouble nor expense, and has in fact fully come up to your recommendations.

Yours, Etc., STARR BROS. & CAMPBELL.

OFFICE S. J. WOOLEN CO., SAN JOSE, January 29th, 1872.

MESSRS. BERRY & PLACE, San Francisco—Gentlemen: We have used a No. 6 Blake Steam Pump now for about two years, both as a Tank Pump and as a Fire Pump in case of need, and it has given excellent satisfaction. *It suits us in every respect.*

Very respectfully, R. F. PECKHAM, Pres't San Jose Woolen Co.

BELMONT, Cal., February 6th, 1872.

MESSRS. TREADWELL & CO.—Gentlemen: In reply to your inquiry concerning the large Blake Steam Pump, purchased of Berry & Place, by Mr. Ralston, I will say, that it gives ENTIRE *satisfaction*, even working as it now is, where no other Pump could; for it has *pressed six feet under water*, yet it does its work PERFECTLY.

Yours, Etc., J. E. BUTLER, Supt. Water Works and Engineer at W. C. Ralston's.

BLAKE'S PATENT STEAM PUMP.

These Pumps have been tested, and found to be indisputably without an equal wherever tried. They have been sold in the Pacific States now for nearly three years, and we are willing every one in use may be referred to; every Pump will speak for itself. They are constructed in the most simple style, and built in the most thorough manner—especially calculated for simplicity, durability and power. Some of the advantages of the Blake Pump may be summed up as follows: It is positive under any pressure. May be run slow or fast as may be desired. Will discharge more water than any others of the same dimensions. Has no leaky joints, the steam part being cast in one entire piece. The steam valve is perfectly balanced, is cushioned at each end, and slides with the greatest facility *having no cranes, our complex rotary arrangements to get out of order.* Will start at any point of the stroke, and will discharge all the water of condensation. The Pump has no crank or fly-wheel, thereby saving a considerable item of expense to the purchaser. Having *no dead points*, it therefore needs no watching, and is consequently ready to start without using a starting bar or any hand work whatever. The Blake Pump is extensively used on Railroads and Steamboats, in Hotels; for Mining and Fire purposes; in Breweries, Tanneries, Sugar Houses, Factories, Mills, Laundries, and as Boiler Feeders, wherever steam is employed. In fact, wherever water or other liquids are desired to be raised in large or small quantities, or against heavy or light pressure, it is the cheapest and best Pump that can be used. It is offered to the public as the most perfect independent steam Pump ever invented. Forty different sizes are made, capable of throwing from 1,000 to 200,000 gallons an hour, and adapted to any class of work that may be required. Every pump will be warranted to perform the work required of it by the purchaser, or it may be returned and the money will be cheerfully refunded. The Blake Pump was awarded a silver Medal at the exhibition of the Mechanics' Institute, San Francisco, and State Fair at Sacramento, as being the best Steam Pump on exhibition. The agents have recently imported several of the largest-sized Mining Pumps for water works, and deep mines, and will be pleased to refer parties to them; we claim for it, that it is the most simple and durable, and consequently the best Steam Pump ever built. For sale by TREADWELL & CO., Machinery Depot, old stand, corner of Market and Fremont streets, San Francisco, who will be pleased to send circulars to any address, or show its advantages to parties calling on them.

It has no Cams or Rotary Complex Valves. It has stood the test wherever tested.

IT IS SIMPLE, COMPACT, DURABLE, AND POWERFUL.

☞ Manufactured by Geo. F. Blake & Co., Boston, who build and have on hand a larger variety of Steam Pumps than any other concern in the country, embracing *forty* different sizes, and capable of throwing from 1,000 to 200,000 gallons an hour, and adapted to every description of work required. ☞ Send for circular and prices.

The largest stock in the country at the Machinery Warehouse of

TREADWELL & CO.,

Manufacturers' Agents, corner Market and Front Streets, San Francisco.

☞ Machinery Depot for Miners, Millmen, and Engineers' Supplies. Iron and Wood Machinery; Portable Engines; Mills; Machinists' and Mechanics', Miners' and Farmers' Tools; Sturtevant's Blowers, Turbine Waterwheels, Etc., Etc.

UNITED STATES INTERNAL REVENUE, DEPUTY COLLECTOR'S OFFICE, 4TH DISTRICT, CALIFORNIA.—NEVADA, March 10, 1872.—Messrs. DEWEY & Co.—Gents: Your letter, together with our patent, was duly received; and for the successful prosecution of our claims at the Patent Office, and prompt attention to the business, please accept our hearty thanks.
Truly yours, ROLFE & ROGERS.

The Scientific Press is the Oldest and Largest Practical Mining Journal in America.

Established in 1860, this weekly has steadily advanced in size, ability and interest. Its chief editors and publishers have had over fifteen years successful experience in conducting this and other journals in California.

Its editorials are carefully prepared with an honesty and accuracy that maintains its reputation as the best authority on mining matters in the country.

It is published in the best location in the world for furnishing the largest amount of valuable information to the gold and silver miners and metallurgists everywhere.

Its correspondents and subscribers are to be found in nearly all the mining districts of CALIFORNIA, NEVADA, IDAHO, MONTANA, UTAH, ARIZONA, COLORADO, and in MEXICO and other foreign countries.

Over 10,000,000 Dollars!

Have doubtless been saved to the miners of the Pacific Coast by reading this journal, each issue of which contains some two pages of MINING SUMMARY from the most important districts in the U. S.; from one to two pages concerning NEW INCORPORATIONS, SHARE MARKET, MINING CORRESPONDENCE, COMMUNICATIONS, etc., and from two to three pages of EDITORIALS (with illustrations) of NEW MACHINERY, NEW DISCOVERIES, PROCESSES, and operations in MINING, MILLING, ROASTING of ORES, ASSAYING, etc.

One feature of our journal consists in presenting in each issue a POPULAR VARIETY of highly interesting matter, useful and instructive for all intelligent readers, systematically arranged in departments under headings entitled Mechanical Progress; Scientific Progress; Mechanical Hints; Home Industry; New Discoveries; Good Health; Domestic Economy, etc., rendering its reading pleasant and profitable at the OFFICE, SHOP AND FIRESIDE.

Yearly subscription $4 per annum. Single copies 10 cents. Four sample copies (of recent dates) furnished for 25 cents. List of California mining books sent free. DEWEY & CO., Publishers, Patent Agents and Engravers, No. 338 Montgomery street, San Francisco.

DEWEY & CO.,

SCIENTIFIC PRESS

U. S. AND FOREIGN

PATENT AGENCY.

The principal Agency on this side of the continent. Established in 1860. Inventors can rely upon the surety and dispatch of all important and confidential business intrusted in our hands. Long familiarity with Mining, Farming, and all other classes of inventions on this coast, enables us to give the most intelligent advice to PACIFIC COAST INVENTORS of any Agency in the Union, and oftentimes save unnecessary delay and expense. Every branch of the patent soliciting business attended to. All WORTHY INVENTIONS patented by us will be liberally noticed, free, at the most desirable time for the patentee, in both the SCIENTIFIC PRESS and the PACIFIC RURAL PRESS.

Send for our 52-page illustrated PATENT CIRCULAR, mailed free on receipt of stamp. Also the U. S. Patent Law of 1870.

DEWEY & CO.,

No. 338 Montgomery st., S. E. cor. California st., diagonally across from Wells, Fargo & Co., S. F.

COMPLETE VOLUMES

Of the SCIENTIFIC PRESS can be had from January 1, 1864, to date, at $3 per single vol. or $6 a year. They afford the cheapest and best information on mining and the industry of this coast of any work published.

THE GIANT POWDER COMPANY

Are now manufacturing besides the famous regular

GIANT POWDER, A NO. 2 GIANT POWDER,

Somewhat slower in its Explosion, which we recommend for

BANK BLASTING, COAL MINES,

AND FOR ALL SUCH WORK WHERE THE ROCK IS NOT VERY HARD

It is fully as safe as the other and evolves neither smoke nor noxious fumes when exploded.

Price. 50 Cents per Pound.

The sales of both grades increase very fast, which is the best proof of their superiority over other explosives.

Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy.

Containing 640 Pages and 81 Engravings.

BY J. S. PHILLIPS, M. E.,

Of San Francisco, a Practical Operator for Thirty-four Years; Explorer, and Resident in the Pacific States and Territories for the past Six Years.

PRICE, bound in cloth, $10 (in coin or its equivalent). In leather, $12. Postage, 50 cents extra. Address all orders (wholesale or retail) to

DEWEY & CO.,

Scientific Press, 338 Montgomery atreet, San Francisco.

Opinions of the Press.

PRACTICAL MINING LITERATURE.—The want of sound scientific knowledge has been much felt by the miners employed in developing the vast mineral resources of the western regions of the United States, and for this want the work of Mr. J. S. Phillips, M. E., of San Francisco, will prove an excellent remedy. The book is written expressly for the miners in the districts mentioned. * * * It is not intended as a scientific work, but to facilitate practical operations upon scientific principles. This object the book is well calculated to obtain, and its value is much enhanced by the principle which Mr. Phillips has adopted of including only those processes which can easily be carried out by practical men unused to the delicate manipulation necessary in the laboratory of the practised chemist. The work will undoubtedly obtain a large number of readers.—[London Mining Journal.

THE most practical and comprehensive work on mining subjects extant.—[Scientific Press.

BESIDES so many new facts and the large amount of useful knowledge derived through these official sources (Geological Surveys), the mining public are likely to find in the recently published work of J. S. Phillips, a valuable teacher and assistant. This book, which treats in an intelligent and practical way on almost every topic connected with mining pursuits, should be in the hands of every millman, metallurgist, prospector and miner on the Pacific Coast. Even the capitalist, and, in fact, every person already engaged in, or likely to become interested in the business of mining, will find in this comprehensive work an amount of information that they cannot afford to dispense with.—[S. F. Commercial Herald.

* * He has rendered to the leading industry of the Coast a valuable service—has furnished the millman and miner a safe and much needed practical guide—having earned for himself, all things considered, the credit of producing one of the most useful works ever issued from the press of San Francisco.—[Overland Monthly.

A PROSPECTOR'S MANUAL.— * * * Each branch is treated with clear style and full information. There are no words without ideas, and no ideas without practical value. Prospectors may imagine that they do not need to study books like this; but we tell them that those who prefer to remain ignorant will, in the course of a few years, be superceded by others who will learn a few fundamental principles. The book is free from trash, and solid throughout; all its matter is intelligible to men of ordinary education, and all of it is valuable to miners.—S. F. Daily Alta, Dec. 24th.

A VALUABLE WORK.— * * We know of no work on these subjects in the English language at once so comprehensive, practical and intelligible.—[S.F. Golden Era.

PRACTICAL MINING AND METALLURGY.— * * In the several sections the work is eminently practical. * * The work is very comprehensive, and contains a great deal of useful information which cannot be obtained from the previous books that have been written on these subjects.—[S. F. Daily Examiner.

* * It appears to be an excellent work, and must prove of great use.—[S. F. Daily Call.

* * Besides that, there is much actual knowledge to be gained from a perusal of this volume, and in this respect alone it will be a valuable assistant to those engaged actively in mining.[—S. F. Chronicle.

* * It is a plain, but comprehensive digest of mining matters generally. It affords a vast quantity of information as to the appearance and value of different ores.—[S. F. News Letter.

SAN FRANCISCO, SATURDAY, MARCH 30, 1872.

VOLUME XXIV. Number 13.

The Dank's Rotary Puddling Furnace.

It will doubtless be interesting to most of our readers to learn the progress which is being made in introducing this important invention into practical nse. Nine of these furnaces are in operation at the Cincinnati Railway Iron Works, and the tenth is now about ready to go into operation. No other puddling furnaces are now used at these works. There aro also nine at work at the Roano Iron Works, Chattanoooga, Tenn. Four furnaces have been completed at the Indianopolis Rolling Mills, Indiana, and six others are in process of erection. A single furnace is at work near Louisville, Ky. This makes the number already erected, thirty-nine. There are may others in operations, of which we have seen no notice.

The general opinion of practical men in this country, is that the machine is a decided success. Thus far, however, no other class of finished work has beeu turned out from iron puddled by this furnance, except railroad iron; and of courso the doubt exists that possibly iron puddled in the Dank's rotary may not be sufficiently pure for general purposes. Bnt in answer to this we have the report of experiments made by the Enghsh commission, at the Cincinnati works, where the English and Welsh specimens of iron, (several tons) brought over for the purpose, were pnddled and rolled into various small sections, plates and sheets, as sample tests of the purity of the production. These experiments were pronunced by the commission as perfectly satisfactory.

The royalty paid per ton for the use of the furnace in this country is said to be one dollar per ton for puddled bar. But the English commission in their report, state that they arranged with Mr. Danks that the royalty to be paid in Great Britain shall not exceed fifty cents. If such is the case it is probable that the inventor will reduce his American to a similar figure.

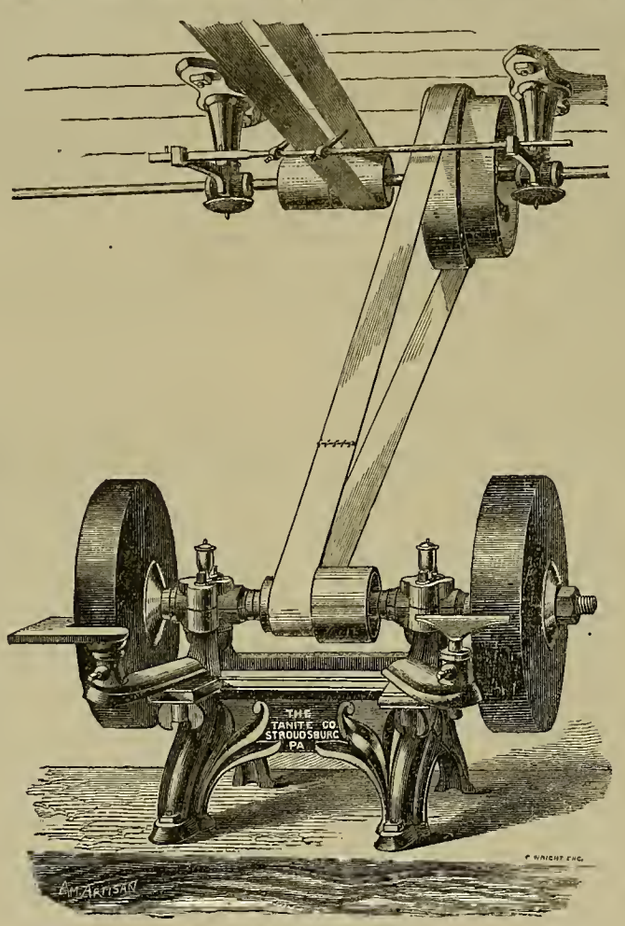
A New Blasting Powder.

A new blasting agent, called the Miners' Patent Safety Powder, is just coming into notice. It is said to be very effective and, at the same time, to possess the merit of heing cheap. One great advantage claimed for it, lies in the fact that it is free from any nnpleasant odor. A series of experiments have lately been made to test its efficiency, and, according to the Nevada *Transcript*, 100 tons of rock was blasted out at an expense of $2.70. Another blast threw out 60 tons at a cost of $2.60, a second quality of powder being nsed. A hole 11 inches deep was drilled in the bottom of a tunnel ahove the Dartmouth mine, aud a 3-ounce cartridge used. The rock was penetrated by the explosion 12 inches below the bottom of the hole made by the drill. The powder is made of different grades, numbering from 1 to 6. The experiments made are said to have been successful, and the absence of any disagreeahle or unhealthy odor, without taking into account superiority of power, will do much towards introducing it into general use.

PROFESSOR SILLIMAN delivered a highly interesting lecture on the "Scientific man," last week, hefore the members of the City College.

Solid Emery Wheels.

Among the specialties of manufacture which have hardly as yet found their way to the Pacific Coast, is that of solid emery wheels and emery grinding machiuery. In this specialty none have done so much to develop the new industry, and to bring it before the pnhlic as the Tanite Company of Stroudsburg, Monroe Co. Pa. This company having taken up the manufacture of solid emery wheels, spent some years



EMERY WHEELS.

in bringing their manufacture to perfection. They are the originators and inventors of Tanite, and the only company in the world which employs for auy object the processes which they have by years of patient application, and by the employment of the greatest mechanical and chemical skill, at last fully developed.

Recently they have erected a machine shop; and giving np the contract system, under which they had, for some years, been putting emery grinding machinery of their own designing and patenting in the market, they have began the direct manufacture of their own celebrated goods. Dealing directly, as they do, with all the principal manufacturers of every kind in the country, and makiug the application of solid wheels and the incidental machinery a careful study, they are able in every case to send just snch goods as are suited to the work on hand. In the steel plow factories of Illinois and the West; the stove fouudries of Albany, Troy, Peekskill, Pittsburgh, Detroit, Philadelphia and Scranton—among the agricultural implement makers all over the United States —and in a largo number of the sawmill and wood-working shops of the country, these goods are justly celebrated, and included among the indispensahles of the business.

The solid emery wheel is to the file what the circular saw is to the hand saw. It is a rotary file, whose points, which never grow dull, aro as hard as adamant. Whilo the file, with slow motion, moves with rasping cut on the metal, say 60 feet per minute at the most, the Tanite Emery Wheel is moving 5,500 feet per minute, and every touch cuts!

Every Tanite wheel is tested before it leaves the factory, at a speed about double that at which it should he run. Every wheel is of uniform density, and perfectly centered and true. These Tanite wheels are entirely devoid of any offensive smell —they generate less heat than some other wheels, and they contain no ingredients which are calculated to affect the health by the inhalation of noxious or poisonous dust. We helieve that these, and other facts, which we have no room to state, show clearly the great superiority of these goods, and entitle them to be ranked among the great labor-saviug tools of the day

The illustration herewith presented represents two of these wheels, in position for use. They are made of varions faces —square, beveled, round, etc., according to the work for which they are desired.

The cutting qualities of the Tanite wheels are said to he so great they will do more work in a given time than any other wheel. The grain of emery in these wheels are not surrounded with a *gummy* suhtance, as in the vulcauite wheels; nor are they emhedded in a stony mass, as in the wheels made by the various processes in which soluble glass—the silicates of soda and potash, etc., etc.—are used; but they are so blended with the Tanite that the two substanoes wear off evenly together, and a constant succession of fresh cutting surface is exposed.

GEOLOGICAL REPORT.—A bill has been introduced in the Assembly by Mr. Pendegast providing that 100 copies of the Geological Report be placed in the Secretary of State's office, subject to order of the Governor, to be distributed to the libraries, colleges, and institues of learning in the United States, and 100 copies to be sent to similar institutions in Europe. It also provides that one copy of the work shall be kept by each county clerk throughout the State, so as to be accessible to any citizen. We hope that this measure will pass, as now it is rather difficult for persons not having access to a public library, or means to buy, to examine the report. The report should be placed where it may be subject to the inspection of all, so as to assist in disseminating a knowledge of the resources our State to those most interested in her welfare.

UTAH MINING BUREAU.—An association has been lately incorporated, known as the "American Bureau of Mining Information for Utah." The organization is intended to foster legitimate and discountenance fraudulent mining enterprises. The objects are to gather reliable information and statistics relating to mineral locations and mining property throughout Utah, their extent, development, value, etc.; keep a record of leading mines; furnish information; advance legitimate enterprises, etc. Mines aro to be registered and bulletins distributed at business centers in this country and Europe. E. M. Barnum, of Salt Lake City, is Secretary.

EDUCATION OF MINERS.—At a recent council meeting of the Miners' Association of Cornwall, it was announced that eleven classes were now in active operation in as many mining centers, teaching chemistry, mineralogy aud geology to upwards of a hundred miners. Of this measure we cannot speak too highly.

CORRESPONDENCE.

Quartz in Tuolumne County.

EDITORS PRESS:—Tho Mount Jefferson mine is owned by San Francisco capitalists, and is being worked on a large scale. A few years since a large amount of geld was taken from the mino with horso power, but at reaching water level, the expense was found to he teo heavy; work was stopped until recently, when a fine steam hoisting works was erected, a shaft sunk 170 feet and two levels run with winzes for air and stoping facilities. All about the premises havo the air ef activity and thrift. Connected with the property is a 10-stamp steam mill and chlorination works in operation; the mill reducing about 500 tons of ore per month, while the sulphurets are saved, exceedingly clean and cheaply by a riffle invented by the euperiutendent, Mr. Lewis, who is a part owner in the property. The

Rutherford Mine

On the same lode or vein is being opened, and ore shipped two miles to mill for reductien. This vein extends a loug distauce as shown hy develepment on and near the eurface, and at the depth of 170 feet, with over 1,000 feet of drifts as seen in the Mt. Jefferson claim, gives evidenco of one of tbe largest deposits of ore in the State, the vein being from 4 feot to 22 feet wide.

Farmiug interests in the county were never hetter tban now; large tracts of land heing cultured; grain looking well, so far as up, with prospect of fine crops.

L. L.

Utah Ores.

BY PROF. B. SILLIMAN.

The ores of the mines thus far openod in the Wahsatch Mountains are largely composed of species resulting from the oxidation of sulphides, especially galenite and antimonial galena, with some ealts of zinc and copper, all containing silver and rarely a little gold. Iron and maganese ochers occur in considerahle quautity in some of them; but the process of oxidation has prevailed very extensively, so that the ochraceous character of the ores is the striking feature of most of the mines in this range.

The great chamber of the Emma Mine, which is an ovoidal cavity measuring, so far as explored, about 110 feet vertical hy about 80 by 110 feet transverse, was found to be filled almost exclusively with epigene species, the product of oxidation of sulpbides, and capahle of removal without tbe aid of gunpowder for the most part. Tbe study of this mass reveals the interesting fact that it is very largely composed of metallic oxides, with but comparatively small proportions of carhonates and sulphates. Fortunately I am ahle to present an analysis of an av(rage sample of about 82 tons of first-class ore from tho Emma Mine, made by James P. Merry of Swansea, April, 1871 which is as follows, viz.

Silica	40.90	Silver	0.48
Lead	34.14	Alumina	0.35
Sulphur	2.37	Magnesia	0.25
Antimony	2.28	Lime	0.72
Copper	0.83	Carbonic Acid	1.50
Zinc	2.92		
Manganese	0.15		90.42
Iron	3.54	Oxygen and water by diff'c.,	9.58
			100.00

The quantity of silver ohtained from this lot of ore was 156 troy ounces to tho gross ton of 2,240 pounds.

This analysis sheds important light on the chemical history of this remarkahle metallic deposit, and will aid us iu the etudy of the paragenesis of the derivcd species. It is pretty certain that all the heavy metals bave existed originally as sulphides, and we may, therefore, state the analysis thus, allowing 8.52 sulphur to convert the heavy metals to this state.

Silica	40.90
Metallic sulphides	52.60
Al .35, Mg .25, Ca .72, Mn², Mn .20	1.52
	95.02
Water, carbonic acid and loss	4.95

This calculation assumes that the sulphides are as follows, viz:

Galenite	38.69
Stibnite	3.30
Bornite	1 03
Sphalerite (blende)	3.62
Pyrite	5 42
Argentite	0.54=52.60

This statement excludes the presence of any other ganguo than silica, aud considering that the ores exist in limestone, the almost tetal ahsenco of lime iu the composition of the average mass is certaiuly remarkable. The amonut of silica found is uoticeable, since quartz is not soeu as such iu this great oro chamber, nor se far as I could fiud, in other parts of the mine. The silica can have existed in chemical comhinatien only in the most inconsiderahle quantity, since the hases with which it could have comhined are present to the extent of less than 1½ per cent, nor do we find in the mine any noticeahle quantity of kaolin or litbomarge, resulting from the decomposition of silicates, nor are there any feldspathic minerals. It is most probable that the silica existed in a state of minute suhdivisiou diffused in the sulphides as I havo seen it in some of the unchanged silver ores of Liou Hill in the Oquirrh range.

The ahsence of chlorino and of phosphoric acid iu the analysis corresponds well with ahsence of the species *cerargyrite* and *pyromorphite*, of which no trace could be found by the most careful search among the contents of the mine. The miners speak of the "chlorides," and the unscientific ohservers have repeated the statement that silver cbloride is found in the Emma Mine, but the ores indicated to me as such are chiefly antimonic ochers.*

The general (perhaps tetal) absence of the phosphates of lead iu the Wahsatch and Oquirrh Mountains, so far as explored, is a strikiug peculiarity of the mineralogy of these ranges. On the other haud, the absence of chlorino in the mines of the two Cettonwoods and the American Fork is in striking coutrast with the constaut occurreuce of cerargyrite (horn silver) iu the Oquirrh and also in the southern extension of the Wahsatch. I have sought in vain for a trace of this species in the dietricts of the Wahsatch just named, and the occurrence of pyromorphite is extremely douhtful.

Molybdic acid, however, exists pretty uniformly disseminated in the mines of the Wahsatch; in the form of *wulfenite*. Although it occurs iu minute quantity, it is rarely ahsent, and may ho regarded as a mineralogical cbaracteristic of the districts of the two Cottonwoods and of the American Fork. For this reason a few particulars will he iu place hero.

Wulfenito is found associated with calamine, (Smithsonite), cerusite, malachite, azurite and more rarely alone in little cavities in the ochraceous ores. In the "Emma Mine," vugs, or geodes, are occasionally found lined with hotryoidal, apple-green calamine, rarely crystallized, often brownish and sometimes colorless, but invariahly associated with wulfenite. Thc calamine encloses and covers the crystals of wulfenite, which form a liniug of considerable thickness. The wulfenite is in thin tuhular crystals of a yellow color, resemhliug the Cariuthian variety of thie species. The crystals aro very brilliant and perfect, but quite minute, rarely two or three millimoters in width, and not over 1mm. in thickness, often less. They are quite ahuudant in this association, no piece of the calamine which I have seen being without them. They sometimes, but rarely, penetrate througb the globules of the calamine so as to show themselves on the upper surface of that species. But the calamine has obviously formed hotryoidal masses around the wulfenite, a crystal of this epecies heing often seen forming the nucleus of the calamine globules.

These facts are of interest in the paragenesis of these epigene species. The oder of production has ohviously heen, first tbe cerusite resting on ochraceous iron, manganese, and other metallic oxides; next, tbe wulfenite crystale were deposited upon and among the crystals of cerusite, and lastly came the calamine, crystalline at first, and as it accumulated becoming fibrous and amorphous, completely enclosing and capping the other species.

Wulfenite occure also in this minc, as likewise in the "Flagstaff," the "Savage," and "Rohert Emmet," without the calamine, hut never, as far as observed, without cerusite and other carhonates. In the "Savage," masses of cerusite with various oxides are interpenetrated hy the tahular crystals of wulfenite.

Although wulfenite forms a very minute factor of the entire ore mass in these mines, by the law of minoral association it may he considered as the characteristic species of the ores of these districts, occuriug in the magnesian limestones. So far as I am informed, or have observed, wulfenite hae not been hitherto found in any of the other mining districts of Utah; but by the same law, it may be reasonahly looked for whenever deposits of epigene minerals are explored in the same geological and mineralogical relations in the Wahsatch rauge of mountains.

The oxiding and desulphurizing agency which has acted upon the great ore mass ef the Emma mine, whatever it was, has performed its work with remarkable thoroughuess. A carefnl study of its action discloses some other facts of interest in the paragenesis of species. From the appearance of numerous large blocks of ore forming solid houlders in the general mass, a concentrio arrangement is easily recognized. On hreaking these masses across, the fresh fractures disclose a dark center which consists almost entirely of decomposed sulphides, composed chiefly of cerusite blackened by argentite and metallic silver in pulvcrulent form. This dark center, chiefly of corusite, is often pseudomorph of galenite in its fracture. Next is usually a zoue of yellowish and orange yellow antimeuial ochre, cervantite, ofteu quite pulverulent, at times only stainiug the cerusite; theu follows a narrow zene of green and hlue copper salts, malachite, azurite, cupreeus anglesite, witb, rarely, wulfenite; then follows cerusite, sometimes etained with antimony ochre, and not unfrequently associated with wulfenite; outside all are the irou and manganese ochres. This concentric arrangement I havé ohserved in a great number of cases; and the ahove order of species, while not invariable, is believed to reflect accurately the general arrangement. Well crystallized species, as mineralogical specimens, are rare in this great mass, hut tbe following may he recognized as its chief components.

Galenite, sphalerite, pyrito, jamesonite (?), argentite, stephauite, boulangorite(?), *antimonial*, *galenite*, *cervantite*, mimetite(?) limonite, wad, kaolin, lithomarge, *cerusite*, anglesite, linarite, *wulfenite*, *azurite*, *malachite*, *smithsinite*. Those most ahundant or hest crystallized are in italics. This list can no doubt he extended as opportunity occurs for the more careful study of the ores, the great mass of which, amounting to many thousand tons, have gone into commerce without passing under any mineralogical eye.

In a subsequent paper will he presented some remarks upou the Oquirrh range and some of its ores, and noticos of minerals from other districts of Utah.

New Haven, January, 1872.

The Gold of the Black Hills.

The reported discovery of gold in the Black Hills is attracting much attention throughout the West, and if the statements in regard to the matter prove to be as well founded as they seem, the discovery will he one of great national importance. For several months past the Indians and whites connected with Spotted Tail's trihe of Sioux have showu rich specimens of gold-bearing quartz, but until a very recent date they have persistently refused to make known the exact locality wbere it was ohtained. At different times adventurous frontiersmen have penetrated this almost wholly uuknown region, and have brought hack specimens of gold tbat certainly left no douht of the existence of the precious metals in paying quantities. In J. Ross Browne's Report it is stated that the explorations of Lieut. G. K. Warren, in 1847, aud of Capt. W. F. Reynolds, in 1859-60, under direction of tbe United States Topographical Office, satisfactorily established tbe fact that the Black Hills of Dakota Territory, were rich in gold and silver, as well as coal, iron, copper, and pine forests. The report further says: "The area occnpied by the Black Hills, as delineated on a map which accompanied Lieut. Warren's report, is 6,000 square miles, or ahout the surface of Connecticut. Tbeir hases are elevated from 2,500 to 3,500 feet, and the highest peaks are about 6,700 feet above the ocean level. The whole geological range of rocks, from tho granite and metamorphosed azoie to the cretaceous formatious of the surrounding plains, aro developed hy the upbeaval of the mountain mass. Thus at the junction of the silurian rocks, gold becomcs accessihle, while the carboniferous strata brings coal measures within reach." "With the pacification of the Sioux Indians, and the establishment of cmigraut roads, this district of Dakota would doubtless he tbe ecene of great mining excitement, as the gold-fields of the Black Hills are accessible at a distance of 120 miles from the Missouri Rivor."

As far hack as 1867, the people of Dakota wore firm iu tho helief that the Black Hills were rich in gold and other minerals. In the year uamed, an expedition was organized hy B. M. Smith, for the purpose of exploring that region, hut the Government, inetead of furnishing an escort of cavalry, as was expected, ordered it to disband. In 1868, Capt. P. B. Davey of Minnesota etarted a similar echeme, hut the Government again refused to allow an expedition of that kind to euter the Indian country.

Last season a party of men, having the same object in view, proposed to explore the Big Horn River, hut were compelled to disbaud for the samo reasou. About a year ago Spotted Tail, the nominal head of a trihe of peaceful Sioux, was prevailed upon to ask for the removal of his agency from the Missouri River hack into the interior about 200 miles. The movement was considered a very strange one at tbe time, and it has since come to light that money and presents were freely used, the prime object sought for being tbe opening of this region for mining purposes. Spotted tail soon found tbat he bad heen deceived, and, taking a large portion of his followers, moved into tho Platte Valley, where he hae since remained, leaving tbe reservation in possession of a large party of white and half breed adventurers. It is now generally believed that the Government will throw no further obstacles in the way of any expedition exploring thie region, and unless scientific explorations, dating hack for yeare, and present indications are wholly at fault, gold fields of extraordinary richness would reward such an enterprise.—*N. Y. Tribune.*

Lead.

The production of pig lead on this coast has been considerahle during the past year or two, and ie likely to he steadily increased. Tbe imports of foreign pig lead at New York for 1871 were 516,900 pigs or ahout the same average for the two previous years. It is well known that important lead mines exist in Wisconsin, Iowa, Illinois and other Western States. The deconnial shipments from the Upper Mississippi mines since January 1, 1821, have heen as follows:

	Pigs.	Tons.
From 1821 to 1831	664,118	23,244
From 1831 to 1841	1,591,950	55,718
From 1841 to 1851	6,170,857	215,979
From 1851 to 1861	4,609,553	161,334
From 1861 to 1871	2,419,985	84,700

The increase for the first 30 years was immense. Since 1851 tbere has heen a steady decrease. The diminished production, we are assured, has not been the result of an exbausted condition of the mines, but is due to the refusal of owners to have them worked. It is estimated that our importations of foreign lead last year cost us $4,000,000. During the past 22 years there was imported at New York alone upwards of 77,000,000 pigs lead, equal to 350,000 pigs per annum. It is eaid tbat a pig of foreign lead is fully equal to two pigs of American. With the immense quantity of lead in tbis conntry it is eingular tbat we ehould send from $3,000,000 to $4,000,000 gold coin every year out of the country to pay for foreign lead. We are not only able to supply the home demand, but ought to be large exporters. We are glad to know that the manufacture of pig lead is attracting increased attention in this city and tbrougbout this coaet.

NEW DISCOVERIES.—The excitement regarding the new discoveries made in the north part of White Pine mining district, and about one mile from tbe city limits, is unabated. Rich specimens of ore are on exhihition from the Silver Plate mine, showing as rich as any ore ever found in the district. This mine ie in a formation of slate and limestone, with well-defined foot and hanging walls, showing a ledge 4½ to 6 feet wide. In every foot made ahead tbe ore improves. The mine has been self-sustaiuing since operatione first commencod. The ore at first was of a low grade, and from several crushings made of ore obtained in einking, the owners realized ahout $2 por day—hardly enough to pay the expensee of provisions and tools. A few days ago the ore-body changed in character and gradually increased in grade, now ehowing a hody of ore that will work $150 per tou at the mill. Six men are employed at present, and ahont 10 tons of ore are extracted daily. There are three owners in the location. Adjoining tbis location ie the Silver Owl Company. The location is 600 feet in length—owned by Wm. N. Osborne and others. The company ie sinking a shaft on the ledge in ore of the same character as the Silver Plate worked in at the same depth. Tbe prospects for finding rich ore at a greater depth are good. Next adjoining ie the Silver Central, recently located. The owners are sanguino of finding a deposit of ore equal to the Silver Plate. A force of men will be put on immediately.—*White Pine News.*

MECHANICS, write for your paper.

*There exists generally among the mining population of the central territories of the United States a distinction between *horn silver* and *chloride of silver*, an error arising, as I am persuaded, from supposing the ochraceous ores to be chlorides not so perfectly developed as to be sectile.

MECHANICAL PROGRESS.

Metal for Bearings.

The following alloy has been found to give highly satisfactory results for plummer blocks, axles, brasses, etc. To 30 parts of melted copper are added 70 parts of antimony; the mixture is melted and run out into thin plates. These are then re-melted with tin in the proportion of 90 parts of tin to 10 parts of the copper and antimony, and run out again into thin plates. When used it is re-melted, and run into the form required. M. Volk, of Regensburgh, has employed an alloy for many years, of which the following are the component parts: Copper, 5.6 per cent.; antimony, 11.2 per cent.; and tin, 83.2 per cent. He also employs the following mixtures to produce metals for various purposes.

For slide valves:		
Copper	81.8	per cent.
Tin	14.8	"
Zinc	3.3	"
	100.0	
or		
Copper	67.0	"
Old brass tubes	22.9	"
Tin	10 2	"
For pump barrels, stop-cocks, and valve-boxes:		
Copper	87.1	"
Zinc	10.7	"
Tin	1.6	"
For stuffing-boxes, valves, etc.:		
Copper	86.2	"
Zinc	2.6	"
Tin	10.3	"
For eccentric rings:		
Copper	90	"
Zinc	10	"
For piston rings:		
Brass cuttings	94	"
Copper cuttings	6	"

PNEUMATIC DESPATCH TUBES.—At the meeting of the (English) Institute of Civil Engineers, C. Siemens read a paper on this subject, which is published in *The Engineer*. The first system mentioned was laid in London and consisted of a tube through which carriers, containing messages, were forced in one direction by compressed air, and in the other by means of an exhausted receiver. This has a limited power of dispatch as one carrier must complete its passage in one direction before another could be sent in the other direction, and it did not admit of intermediate stations.

In 1863, Messrs. Siemens & Halske introduced their system at Berlin. This consisted of two 2¼ inch tubes, forming a circuit. Through these flowed a continuous air current, of course passing in one direction in one tube and in the opposite direction in the other. Carriers could be put into the tubes at any point. The continuous air current was produced by means of a steam engine working a double-acting air pump. In Paris there was also a circular system, but without a continuous air current, the carriers being driven from one station to another by air compressed by means of water from the city mains. This was very limited in capacity and required a large expenditure of water. In London there was a large cast-iron tube of a ⊏ section for carrying parcels. Here, in 1870, the Siemens Brothers introduced their circuit system with continuous air current, and this has been found to work well and has since been extended. As above, carriers can be sent or received at any point. As to the speed of the carrier it was found that it traveled 4,116 yards, or over the whole circuit in 7 min. 45 sec. Instead of a steam engine and air pumps, the necessity of which was a hindrance to the general introduction of pneumatic tubes, a simple and cheap arrangement, something like the Giffard Injector, has been used with very good success for producing the continuous air current.

CASE-HARDENING.—It is often desirable to convert the surface of small iron articles into steel, to prevent wear and tear, and also to prepare them for a high polish. To do so is much quicker and cheaper than to make these articles in the first place out of steel. The older process consisted in placing them in an iron case with burnt bone dust or other charcoal, exposed for from two to eight hours to a dull red heat, and plunged into oil or cold water, which cooling is called "quenching." The process is varied at times by leaving its subjects to cool in the case, and afterwards tempering them. A later mode is to use prussiate of potash. This consists of two atoms of carbon and one of nitrogen to one of potash. Its decomposition leaves no solid residium that can interfere with the chemical change or injure the quality of the steel. It is rubbed on the iron at a dull red heat; the metal is then put in the fire for a few minutes, and then tempered in water.

It was formerly customary to case-harden burglar-proof safes, the iron doors of banks, etc., so that they might resist the drills of thieves. Such articles are now made mostly from Franklin iron, which is manufactured from an ore found at Franklin, N. J., and nowhere else in the world. This iron is peculiarly hard, and is found to be about as effective as if case-hardened.

THE ST. LOUIS BRIDGE is progressing rapidly. The concrete or foundation of the last pier has been laid, the masonry is two-thirds completed and the superstructure is commenced. The cast-iron plates at the piers have been placed and prepared for the reception of the steel tubes forming the spaces. It will be completed in about a year from now.

Steeled Wheels.

This novel title is given to railway wheels made by a process which must rank among the great improvements recently made in the working of metals, by Mr. W. G. Hamilton, engineer, of the Ramapo Wheel and Foundry Co., which, after 4 years of experimental trials, is now brought prominently before the public.

Mr. Hamilton, who is well known to the railway profession, through his "Manual of Useful Information to Railway Men," has worked out the problem of making chilled car-wheels out of non-chilling irons, and at the same time increasing the strength of the mixture above that of the most expensive charcoal irons.

The process consists in part in melting scrap steel, with the ordinary charge of pig metal, in the cupola, by which an increase of strength of from 20 to 50 per cent. is given to the metal.

Messrs. A. Whitney & Sons, the extensive wheel founders of Philadelphia, have been testing the practical utility and value of the process, have made some 15,000 wheels, during a continuous working during the last 3 months, and report it a most complete success.

That this process will enable them, by adding to their usual chilling charcoal irons a portion of non-chilling soft charcoal irons, or anthracite metal, to produce a car wheel of greater strength, and at a much less cost, than with high-priced chilling charcoal irons alone.

To the railway community the value of this improvement will be understood, when it is known that the supply of charcoal irons is yearly diminishing and the cost increasing, and that the steeled metal gives greater security to their rolling stock.

CURVED LOCOMOTIVE SMOKE-STACK.—According to the Boston *Transcript* a Massachusetts invention has lately been tried on the Fitchburg railroad with good results. It consists of a curved smoke-stack, of nearly the shape of a "horn of plenty," attached as ordinary smoke-stacks are, the mouth running backward. Within, near the enlargement at the upper curve, is placed a wire screen at an angle of about 45° with the direction of the smoke, and the usual screen is placed over the immediate outlet. Just below the first screen a perforated steam pipe runs horizontally through the smoke-stack, and is connected with the boiler by a valve-pipe under the control of the engine-driver. As the refuse matter from the furnace passes through the stack, it is moistened by the fine spray ejected through the perforations, thus deadening the particles and increasing their weight. Striking against the inclined screen, they are deflected downwards and led through a proper tube below the engine, falling on the track in a moistened and consequently harmless state. The arrangement does not hinder the draft. Not only is the trouble of cinders upon the train obviated, but damage from fires along the track is also prevented.

BROAD AND NARROW GAUGE.—A writer in *Van Nostrand's Mag.* argues in favor of the broad (6 feet or more) over the narrow (4 7-10 feet) gauge for railroads, claiming a gain in all respects for the former. In regard to the present general use of the narrow gauge he says that it has been adopted "for reasons which it would not be creditable to our railway managers and to the profession to state"—a statement which may be satisfactory to the author, but which the general public can hardly be expected to swallow. In his comparison, however, he gives figures to prove that the cost of building and running roads of broad gauge is less than for those of narrow gauge. His argument is by no means complete. In conclusion he says that it is now understood that several leading engineers in Europe, dissatisfied with the narrow gauge of 4 7-10 feet or 5 feet, are seriously considering the question of recommending the 6-foot gauge as the best uniform gauge for the entire of Northern Europe and Asia.

IRON CARS.—A model of a freight car is attracting considerable attention at St. Louis. It is cylindrical in form, and is constructed of iron. By the peculiarity of its form, pressure on the sides is avoided, and having a false floor, better ventilation is attainable—a matter of great importance in the transportation of fruit, grain, flour, and many other perishable commodities. It is, moreover, fire-proof, and when constructed with equal strength and capacity weighs one ton less than a wooden car. We are not informed as to the comparative cost of construction.

ENAMEL FOR METALS.—M. Pleischl, of Vienna, claims to have discovered a vitreous enamel for metals which combines the properties of extreme hardness, durability, freedom from noxious ingredients (lead and zinc), and malleability by contact with the substances to which it is applied.

IRON VESSELS of a thousand tons are now built which draw only eighteen inches of water, and a company has been formed in New Orleans to provide such vessels for the transportation of the products of the Mississippi Valley to that city.

THERE are eight large establishments in the United States engaged in the manufacture of pins, one factory turning out an average of about eight tons a week. American pins are considered the best in the world, and the demand from foreign countries is constantly increasing.

SCIENTIFIC PROGRESS.

Peculiar Phenomena Observed in Quarrying.

W. H. Nile, Prof. in the Massachusetts Institute of Technology, describes in the *American Journal of Science*, certain phenomena which are often observed in quarrying, such as fractures, sudden movements, and expansions of beds of stones connected with quarrying, and due apparently to the state of tension to which the bed was subjected when in its original state in the quarry. The Prof. mentions a spontaneous fracture in a bed of gneiss three feet and nine inches thick, which was sixty-one feet long, and mainly in the direction of the strike, but with some abrupt transverse turns. The transverse fractures were opened wider than the north and south—in two and a half months, the former five-eighths of an inch, the latter nowhere over one-fourth—showing that there was less resistance to motion in the direction of the strike. He mentions cases of anticlinals formed by movements in beds. In one instance a bed of gneiss twenty inches thick had been elevated an inch and a half, the northern slope of the anticlinal measuring twenty-three feet. The fold trended east and west, and at one end there was a crack three-sixteenth of an inch wide. In another instance in a bed three inches thick, the amount of elevation at the center was one inch, and there was a fracture along the whole length of the crest, trending east and west. Prof. Niles observed a bend form in a bed two and three-quarter inches thick; in a few hours the portion of the bed forming the crest was elevated three inches and a quarter, and the crest—five and a half feet long—had a fracture along it. Sudden sounds and explosions sometimes attend the movements and fractures; and the sounds occur in all seasons, though more frequent in summer. Sometimes they are louder than the report from a blast, and at one time led to the supposition that the powder magazine had exploded.

The following is the example of the expansion of the rock during quarrying. A mass split off along one side, by wedges in a series of drill holes, for a length of 354 feet (requiring 1,200 wedges) in the direction of the strike, or nearly north and south, had a width of eleven feet and a thickness of three. By one end it was still attached. Soon after the fracture was made, it was observed that the halves of the drill holes were not opposite, and at the free extremity the amount of dislocation amounted to an inch and a half; or in other words, the stone was an inch and a half longer after the fracture than before. The subsequent exposure of the stone to the varying temperature and conditions of the weather for two months produced no change. As the free extremity was higher than the other, the phenomenon was not produced by gravity. Three other instances are mentioned of similar effects; on a smaller scale.

TEHAUNTEPEC SHIP CANAL.—The Commission appointed to examine and report on the Tehauntepec ship canal project have published their report. It may be found in *Van Nostrand* for February. The eastern terminus of the canal, as proposed, is at the junction of the Coahuapa and Goatzacoalcos rivers, about 30 miles from the Gulf of Mexico, the latter river forming an excellent harbor for that distance. It runs west to the summit of Tarifa, 680 feet above the sea level, crossing on the way the Chalchijapa, Chicolote, Goatzocoalcos (at Old Mal Paso) and Malatengo rivers. From the summit it passes through a plain where a cutting 100 feet deep, for several miles is recommended, descends to the plains at the foot of the mountains—a descent of 360 feet, requiring 35 locks,—and thence with a fall of 240 feet in 14 or 15 miles reaches the Upper Lagoon. Thence to reach the Pacific one or both of the narrow peninsulas, separating the lagoon from the ocean, must be cut through, and an external harbor or entrance piers thrown out. The plan is for a ship canal with an available depth of water of not less than 20 feet, with locks 450 ft. long and 50 ft. wide. Total length of artificial canal, 115 to 120 miles; number of locks, 120, with 10 foot lift; total rise, 600 ft. The country is healthy and very productive, laborers are easily obtained and building material is abundant. The extensive use of timber instead of masonry is recommended.

ABSORPTION OF MOISTURE BY BRICK AND STONE. Prof. Draper, of University Medical College, New York, has been making some experiments with regard to the relative absorption of moisture by brick and stone, using brown stone, Nova Scotia stone of the best quality, fine red Philadelphia brick, and a compact, hard-burned, white brick from New Jersey. His experiment showed that brick absorbs more moisture than stone, but parts with its imbibed moisture more readily, and therefore preferable as a building material, and that the white brick is superior to the red, absorbing only half as much moisture. In cases corresponding to the dews of summer or fogs, brown stone absorbs more moisture than the Nova Scotia stone and both these more than brick, and hence are more favorable to vegetable growth and inferior for building purposes. On the whole the materials rank in relative value for building as follows: 1. White brick; 2. Red brick; 3. Novia Scotia stone; 4. Brown stone.

The Late Solar Eclipse.

Accounts are slowly coming in, mostly by telegraph, from the various stations established to make observations upon the late eclipse. It will be some time yet before full reports will be received, and still longer before these reports will be collected, compared and properly worked up so as to determine their real value.

So far as yet appears, the observations have not developed any new facts; but have in several instances furnished important confirmation of conclusions which had already been measurably attained on previous occasions, but not with sufficient evidence to secure the entire acquiescence of all astronomers.

One important point thus definitely attained is the assumption that the corona is not to any considerable extent the effect of the atmosphere of either the earth or moon, but that rings, rays, rifts, streamers and all is a true solar appendage only slightly modified by our own atmosphere.

Dr. Janssen, one of the observers at Hindostan, writes to Prof. Newton that his observations proved that, independently of the cosmical matter which should be found near the sun, there exists about this body, an atmosphere of great extent, exceedingly rare, and with a hydrogen base. This atmosphere which doubtless forms the last gaseous envelope of the sun, is fed from the matter of the protuberances which is shot up with great violence from the interior of the photosphere—in the manner shown in the recent illustrated description given of one of these phenomena as observed by Prof. Young. Prof. J. supposes that it is this atmosphere which produces the large part of the phenomena hitherto denoted by the name of *solar corona*.

The question of the polarization of the corona light seems to be still left in doubt, owing to the puzzling inconsistencies, as heretofore noticed, between different instruments and observers.

Prof. Young, the American astronomer, who has pretty carefully analyzed the brief reports already received, writes to the Boston *Journal of Chemistry* that when we get the full reports, with photographs, etc., it may possibly happen that their comparison may lead to some entirely new discoveries, and almost certainly some new question will be raised which can be settled only at the next eclipse.

SOLID IRON FLOATING ON MELTED IRON.—E. Schott writes concerning this to the *Berg. u. Hutt. Ztg.* In casting wheels he divided the molds in two parts and surrounded these with a spring ring. As soon as the melted iron poured into the mold began to cool the ring opened and that up to ¼ inch, the wheel being 18 inches in diameter. After cooling the casting shrunk to less than the original size of the mold. From this it follows that iron when heated has a greater, and when cooled a smaller volume than when fluid. The larger volume must, therefore, possess a less specific gravity, as is confirmed by the phenomenon of solid iron floating on melted iron. Commonly thin pieces of iron are employed for observing this phenomenon. The iron being a good conductor of heat, speedily acquires the temperature of the fluid mass up to a bright red heat—the degree necessary for the greater expansion—and thus acquires a smaller specific gravity than the fluid bath and consequently swims on it; and this it does the more quickly, the thinner it is, and *vice versa*. Thicker pieces sink at first, but rise to the surface as soon as they are expanded by the heat,—somewhat analogous is the relation of ice to water.

SEC-SYSTEM OF NOTATION.—Dr. Lehmann, of Leipzig, according to the *Mechanics' Magazine*, proposes a new system of notation with 6 as a basis, counting and reckoning with half-dozens instead of tens. To avoid confusion, the name *six* may be changed to *sec*, so that we would count one, two, three, four, five, sec. The higher figures might be called twosee, threesec, foursec, secsec or sess. This latter would be equivalent to 36, but would be written 1 and 2 noughts. It is further proposed to change the type so as to suit the new system. Among the advantages noted is the reduction of the extent of the multiplication table so tremendous now to school-boys and others. The following shows the extent of the tables under the sec-system. In making use of the ordinary type, it must be borne in mind that 10 is equivalent to 6:

2×2= 4	3×2=10	4×2=12	5×2=14
2×3=10	3×3=13	4×3=20	5×3=23
2×4=12	3×4=20	4×4=24	5×4=32
2×5=14	3×5=23	4×5=32	5×5=41

The greater ease of addition, subtraction, multiplication and division would guarantee the decrease of errors in arithmetical calculations, etc., etc.

EXPLORATION OF ROME.—Renewed interest is now being shown in the exploration of the buried relics of Rome. The new government shows a disposition to take the matter in hand and private parties also are in the field. Two schemes have been prominent of late. One is to divert the river Tiber from its channel, with the idea that from its bed many relics of value will be obtained. Another is that of an Englishman, J. H. Parker, who has already made excavations and discoveries of no small interest, and who now proposes to form a company with a paid up capital of $250,000, with the object of purchasing land in Rome, exploring it to the utmost, and then reselling it at an advanced price.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE COUNTY.

HOISTING WORKS.—Silver Mt. *Chronicle*, March 16: Both the Excbequer and I X L mines will soon be supplied with hoisting works, and the mills and mines this summer will furnish employment for upwards of 100 men.

AMADOR COUNTY.

BARLOW MINE.—Jackson *Ledger*, March 16: The rock in this mine coutinues equally as rich as when first struck.

BUTTE COUNTY.

BUTTE CREEK MINES.—Chico *Enterprise*, March 16: The Cberokee Co. commenced "piping" on Butte Creek above Centerville, on Wednesday. They have an ample supply of water, and are washing down the side hill with great rapidity. Hupp, McNair & Co. turned the water on, in the vicinity of Centerville, on Mouday, aud are workiug their claims day and night.

CALAVERAS COUNTY.

HUDSON LODE.—San Andreas *Citizen*, March 23: The developmeuts in this lode are very extraordinary. The Co. are running 3 shifts—3 men each, working 8 hours—and are down 100 ft. The veiu here is 9 ft. wide. Next to the hauging wall there is ahout 4 ft. of rock filled with sulphurets of hoth gold and silver. In the ceuter there is a little over 2 ft. of decayed rock partaking of a limestone nature, which is very rich. Outside of this, aud next to the hanging wall, is about 3 ft. of decayed, though not soft, rock literally filled with gold.

CENTRAL HILL.—The gravel claim of John Shear is paying remarkahly well. Other claims are also paying.

CALAVERAS HYDRAULIC CO.—Nineteen hundred ft. of 11-inch iron pipe will be laid, calculated to convey 300 inches of water through a "Hydraulic Chief," with a 4-inch nozzle, against the immense hanks of auriferous gravel belouging to the Co. The sluice hoxes will be some 300 ft. in length hy 24 inches in width and depth, with a grade of 9 inches to 12 ft., carrying tbe tailings to a spacious dump in Chili Gulch.

ANGELS QUARTZ M. CO.—This Co. are dropping their whole 30-stamps on rock from tbe 500-ft. level, which yields $30 per ton.

WEST POINT.—Calaveras *Chronicle*, March 23: In the Zacetara tbe shaft is 200 ft. deep and the lead has widened out until it fills the fissure, the walls being 5 ft. apart.

The Bartolo mine is making favorahle progress.

STEGER MINE.—The Co. have erected a water-power pump of sufficient capacity to keep the shaft dry, and the work of sinking is progressing rapidly. A first-class quality of rock is being ohtained.

REED & HILLARY are preparing for active operations as soon as Spring fairly opens. There are a number of other mines in the dist. in which favorable developments are heing made.

SCIFFORD MINE.—Rock of extraordinary richness has heen developed in the miue, near San Andreas. At the depth of 19 ft. the ledge shows 8 ft. in width, nearly all of which will pay largely for crushing. The lead exbibits every indication of heing a permanent one, and will unquestionably develop into a valuable miue. It is reported that the proprietors have heen offered $20,000 for the ledge.

STICKLE MINE.—A clean up was made a few days ago, after crushing ahout 120 tons of rock, which netted 200 ozs. crude bullion. The rock averages $7 a ton.

EL DORADO COUNTY.

EL DORADO.—Cor. Placerville *Democrat*, March 23: N. Gilmore and Tom Stapleton, have sold out one half of their "Diamond Hill Claim." Ellsworth & Co. have commenced work on their claims iu the western part of the town.

Innumerahle prospectors range the hills and valleys in search of leads, and many with marked succese. The old Pocahontas Mine has again developed a vein of rich ore in the 400 ft. level.

THE DAVIDSON MILL made a short run, though a very satisfactory one. They have a splendid 20-stamp mill and a fine lot of ore on the dump.

THE Montezuma is doing finely.

Snyder & Co., on Mathenas Creek, have struck a rich lead, and are in negotiation with some S. F. capitalists. Their rock will pay anywhere from $300 to $500 per ton.

A Santa Clara Co. have struck an old ledge about a mile west of here on Dry Creek. They will soon have a mill and machinery for hoisting on the ground.

SPECIMENS. — Placerville *Republican*, March 21: On Monday we were shown several specimens of very rich quartz taken out near Grizzly Flat. Two lbs. of rock cleaned up $15 one day last week.

DIAMOND SPRINGS.—Cor. same: A very rich strike in quartz was made a few days ago ahout one mile from tbis place by Schneider & Co. The ledge is from 2 to 3 ft. in width, and will average at least $100 per ton. A large Co. has commenced work on Diamond Hill.

MARIPOSA COUNTY.

HORNITOS DIST.—In and ahout Washington miue 40 men are employed. The lower level is ahout 420 ft. in depth. The quartz makes an excellent showing of free gold aud sulphurets.

Ex-Assemblyman Pool struck a very rich quartz claim early in the winter, in his garden. He has pounded out several thousand dollars, in a hand mortar, and crushed about 30 tons which averaged 2 ozs. of pure gold to the ton. At the deptb of 20 ft. it is over 6 ft. in thickness, and apparently richer than on the surface.

NEVADA COUNTY.

GREENHORN.—Nevada *Gazette*, Mar. 16: This mine is progressing finely. A ledge of from 4 to 6 ft. in width is opened, and first grade rock is being extracted.

GOOD ROCK.—The Murchie Bros. have struck some spleudid quartz in their tunnel, paying from $50 to $75 per ton. This mine is on the Red Dog road, about 2 miles above Nevada City.

LOCATION. — Little York township—Bird's Eye Cañon Co. have located a water privilege of 2,000 inches, in Steep Hollow Creek.

OMEGA.—Nevada *Transcript*, Mar. 21: Some 7 or 8 claims are heing worked, and the prospects are good for an excellent season.

SELBY FLAT.—Considerable miuing is heing done this season, and large heads of water are running in ravines where mining has not heen done for several years.

IDAHO.—The owners are making arrangements for extensive improvements. A 20-stamp mill is to he erected, aud a new incline is to be sunk, requiring new steam machinery.

THE St. Patrick's Q. M. Co. have located 1,600 ft. on the Manhattan ledge on Negro Hill, in Grass Valley towuship.

BLOOMFIELD. — Cor same: The N. Bloomfield Gravel Co. are washing vast bodios of gravel dowu into the Yuha river.

ROUGH AND READY.—The striking of a rich lead on Randolph Flat, nearly opposite, and in a westerly direction from the Exchange, is creating considerahle excitement in that township. On Thursday Reese & Depew cleaned up 68 ozs., and have taken out since they commenced there—only 2 or 3 weeks' time—upwards of $5,000. They claim only 300 ft. of the grouud and other Co's. are taking up extensions. Reese & Depew have only worked ahout 20 ft. on their ground and about 12 ft. deep. The quartz is mostly decomposed. On Friday last they struck harder rock and a hetter ledge was coming in. Our informant saw one pan washed which yielded over $5. The ledge is ahout 5 inches in thickness and as they prospect it it increases not only in richness but in size.

Gashweiler & Co. have taken up an extension about 150 ft. from the Depew ground. They sunk down about 5 ft. and struck a good ledge. They got a fiue prospect which contained over 100 colors.

PLACER COUNTY.

RICH ROCK.—Placer *Herald*, March 23d: At the bank of Hubhard & Andrews can he seen some splendid gold quartz, taken from the Greene mine, 2 miles west of here. This ledge has heen rich from the top down, the sample we refer to being taken from the shaft at a depth of 215 ft. The 8 or 10 lbs. we saw were taken from the foot wall, at the ahove depth, and is solid, hluish quartz, inpregnated with fine bright gold, the surface next the wall rock being almost a sheet of gold.

BELLEVUE.—The last crushiug of Bellevue ore at the St. Patrick mill yielded well. Ahout 90 tous were milled, yielding over 164 ozs. of pure gold, making $30 per ton.

HARRISON LEDGE.—Last Saturday Mr. Harrison pounded up 3½ lbs. of rock, and got $50 out of it.

ST. LAWRENCE MINE.—The ledge is about half a mile north of the mill, and runs nearly east and west, crossing a small ravine near the St. Patrick mill. The owners have 1,200 ft., and a shaft sunk on it 50 ft. deep, the best rock coming from the hottom. Supt. Prudy lately crushed 40 tons, taking it as it came from wall to wall of the ledge, which yielded an average of over $22 to the ton. The ledge is 20 iuches thick, and the capacity of the mill is 300 tons per month.

PLUMAS COUNTY.

STARTED UP.—Plumas *National*, March 16: The Indian Valley Co. started their mill one day this week, and their prospects for large returns are said to be good.

NEARLY THROUGH.—The Devil's Elhow Co. have nearly finished tbeir bed-rock tunnel, only having about 20 ft. to run to find daylight.

WORK COMMENCED.—Work has been commenced to drain the Crescent mine, and the indications are that operations will soon be iu full hlast.

RICH ROCK.—Compton's mine, at Cherokee, is looking hetter than ever, and the rock being takeu out yields well.

SAN DIEGO COUNTY.

BULLION.—San Diego *Union*, March 14: There was shipped to S. F. yesterday, bullion amounting to $1,300, from the San Diego mines.

CLEAN-UP.—The Stonewall mill cleaned up on Friday last. The result was a $1,000 gold brick.

THE MINES.—All the mills are running on full time. Work on the Butler is going on steadily. Their last crushing gave them $53 per ton.

SIERRA COUNTY.

NEW QUARTZ MILL.—Downieville *Mcssenger*, March 19: Jim Olin is going to huild a new quartz mill on the river above town for crushing Good Hope rock.

BALLY HACK.—Cor same: The Monumental Claim is the ouly one at present paying.

The Hawk Eye Co., at Howlaud Flat, have made but little progress with their shaft.

The Union Co. are still pushing their drain tunnel ahead to tap the water at the foot of the incline.

YUBA COUNTY.

BROWN'S VALLEY.—Marysville *Appeal*, March 23: W. Hoyle and otbers are opening a quartz claim in a ravine, near tbe town of Brown's Valley, with flattering prospects of success.

Nevada.

EUREKA DISTRICT.

MCGEARY. — Eureka *Sentinel*, March 17: Water was struck on the Josephine, at 65 ft. This necessitated the runuing of a tunnel which is progressing finely.

SILVER WEST.—The main incline has been eunk 46 ft. Ahout 20 ft. from the surface a level was opened up and a chamher of fair grade ore wae extracted. The amount of ore in sight is upwards of 1,200 tons. The ore is chiefly gray carhonate of fine grade. A lot of 150 tons smelted a short time since netted $69.11 per ton, gold and silver, and 52 per cent. lead. There are about 150 tons on the dump, which is estimated to he worth $100 per ton in gold and silver, and 65 per cent. lead.

ELY DISTRICT.

PIOCHE BULLION.—S. L. *Tribune*, March 22: W. F. & Co. received on the 15tb, from Raymond & Ely, 14 bars, worth $16,-054.51. On tbe 17th, they received 21 bars, worth $34,181.75, from R. & E., and 7 bars from Meadow Valley Co., worth $9,280.97. On the 21st they received 21 hars, worth $31,669.55, from R. & E., and 6 hars worth $7,872.03, from Meadow Valley Co. On the 17th they forwarded to N. Y. 20 bars from R. & E., worth $32,183.52, and 17 hars worth $20,461.14, from Meadow Valley Works. Durant & Cutting shipped yesterday, one car load of bullion to the Omaha S. and R. Works.

BULLION.—Pioche *Record*, March 14: W. F. & Co. ehipped to-day, bullion valued at $86,726.93.

PIOCHE.—The ledge shows in all the works dowu to the 360-ft. level. The shaft has been sunk to the 460-ft. level, and tomorrow there will be a drift started from this level for the ledge.

MAGNA CHARTA.—This claim is being prospected with favorable indications. The shaft is down 60 ft. on a ledge 4 ft. wide at the hottom.

HUHN AND HUNT.—The Supt. has commenced to drift, taking ore from hoth drifts and from the inclines. There are 100 tons of ore on the dump.

HUMBOLDT.

BULLION.—Unionville *Silver State*, March 23: Amount ehipped from the Arizona mine, since our last issue, was $5,353.

PROSPECTING.—A prospecting expedition left town on Tuesday for Sacramento Dist.

VALUABLE.—The price paid S. D. R. Stewart, for his interest in the Arizona mine, was at the rate of $750,000 for the whole mine.

ARABIA DIST.—Last month Mr. Lovelock discovered the Brazil veins wbich consist of 5 parallel ledges, a few ft. from each other, and averaging 2 ft. wide. A 40 ft. shaft has heen sunk on the hack ledge, the ore yielding $137 per ton, in silver, the tailings assaying $28 per ton. He has also discovered a lead, 150 ft. wide, which has been traced 15 miles; the croppings of which assay from $10 to $20 per ton.

ARIZONA.—At no time has the mine looked hetter than at present. In the new shafts and levels, hlack sulphuret is exposed, and in the southern end of the works the lead is larger and the ore richer than ever hefore.

STAR CITY.—Cor. same: The priucipal miue, and the only oue worked in the dist. is the Sheba on the north side of the main cañon. Under the present management the main tunnel was carried into the hill 650 ft. where a cross drift again disclosed the vein, regular in its course and richer than ever hefore. Since the discovery of the Sheha, a force has heen employed in making further explorations upon the ledge, and in extracting ore. The character of the ore is argentiferous galena, and if carefully selected, brings in the S. F. market prices ranging from $500 to $2,000 per ton.

REESE RIVER.

FIRST SHIPMENT.—Reese River *Reveille*: Three hars of hullion valued at $2,415.30 were shipped to-day by W. F. & Co. from the Twin River Co. consigned to S. F.

RICH STRIKE.—The largest and richest body of ore ever yet discovered in the mine was struck a few days since in the El Dorado South at Belmont at the hottom of the south level, ahout 350 ft. from tbe surface. The ledge is 10 ft. thick, ahout half of which is the richest kind of pay ore.

WASHOE.

STARTED UP.—Virginia *Enterprise*, Mar. 22: The Justis Co. have started up their works.

DEEPER.—Capt. Taylor of the Yellow Jacket informs us that in 60 days he will open a new level 70 ft. helow tbe level of the Sutro Tunuel.

PARKE & BOWIE still keep their hig tailings mill, on Six-mile Cañon, in full hlast.

OVERMAN.—Gold Hill *News*, Mar. 18: The new shaft of the Overman M. C. is down 600 ft.

WHITE PINE.

BULLION.—White Pine *News*, March 16: W. F. & Co. shipped hullion yesterday to the amount of $27,903.37. Ten hars amounting to $13,695.93, are credited to the Eherhardt & Aurora Co.

TREASURE HILL MINES—EBERHARDT.—Work was resumed in the Keystone shaft last week, with a force of 5 men breasting out in a huuch of rich ore on the south side of the shaft. The tunnel connecting with the Keystone shaft will be cleaned out and put in order, for the purpose of running out the ore from the workings.

NORTH AURORA.—At work hreastiug out in the uortheast end of the chamber, and sinking the shaft. The ore taken out last week milled $80 per ton. Since tben tbe grade of the ore has run up to $100 and $120 to the ton. There is 50 tons of this grade of ore shipped away to mill. The ore from the Lady's chamher mills $50 per ton. About 50 tons per day are sent to mill.

WARD BEECHER.—Sinking winze in east end of Philpotts' chamber.

SILVER WAVE.—The Perkins shaft has a depth of 125 ft. The Supt. proposes to let a new contract to sink 50 ft. deeper. The chances are favorahle that the ore channel will be reached inside of 50 ft. from the present workings. The halance of tbe force employed is breasting out in the Boswell chamher. There are about 100 tons of ore on the dump.

SOUTH AURORA.—There are 20 contractors, 2 carmen and 1 blacksmith engaged about the works. The main tunnel is in 520 ft. There are 3 drifts running east and one running north from the main tunnel. For the purpose of making the situation of the drifts running east from the tunnel understood, they are designated by numhers. No. 1 starts 250 ft. from the mouth of the main tunnel—in ahout 50 ft, in a formation of hlaek limestoue. No. 2 is ahout 370 ft. from the mouth of the tunnel—in 49 ft. The formation is hlack limestone and spar. Drift No. 3 is at the end of the tunnel—in 150 ft. eastward. The contractors are pushing work ahead. Halfway in the drift a shaft is sinking, and down 50 ft. The North drift, running to prospect ground north of the tunnel, is in 55 ft.

GROUP MINES.—The mines known as the Group are on the west side of Mahogany Cañon, below the Eberhardt. They comprise the Grant & Colfax, Indianapolis, Eureka, El Dorado, and Sharp. All of them are well prospected and show fair ore. Assays of 27 samples of ore from the El Dorado went from $57 to $256 per ton. Assays from the Indianapolis have turned out equally as well; and the Grant & Colfax, Eureka and Sharp show a good quality of milling ore.

GEN. LEE.—The contract on the drift is completed. Another contract will be let in a few days. The ore has improved for the last few feet, in running ahead.

MAMMOTH.—A force of 8 men breasting out, and extracting 8 to 10 tons of ore per day.

LIVE YANKEE.—This mine is west of the San Juan Del Rio ground in Mazeppa cañon. Work was resumed last week. At 25 ft., there is a body of high grade ore in sight that it is estimated will mill $300 to the ton. Joining this location is the Miner's Dream, showing a good body of ore. Eight tons were milled a few months ago that worked $125.

SECOND SOUTH EX. OF HIDDEN TREASURE. The drift running to connect through the shaft near the North line, from the Anchor incline, is in 60 ft., showing a spar wall the whole length. A drift south to meet the Anchor drift, is in 60 ft.

BEECHER CON.—The foreman and 3 men are breasting out and piling back the ore in the stope. A large force of men will be put on and the Manhattan mill started up when a supply of ore is on hand.

EAST SHEBOYGAN. — The Exchange incline is in the hands of contractors, who are making fair progress sinking.

COPPER GLANCE.—A body of ore was recently developed of fair grade, which opens out in a larger body as the drift goes ahead.

SILVER HILL MINES—SILVER CENTRAL.—A contract was let last week, at $15 per ft., to sink a vertical shaft 40 ft., or to the ledge, if within that distance.

OWYHEE.—There is one shift of men employed sinking on the ledge from the face of the old cut. A showing of fair ore is in sight in the incline.

SILVER PLATE.—Five men are breasting out in the face.

SILVER OWL.—There is a shift of 2 men at work.

SILVER CLOUD.—Two men are engaged to cut the ledge.

Arizona.

MINES AND MINING.—Prescott *Miner*, March 9: In the Tiger the Supt. has a force of men taking out ore for shipment to S. F.

In Pine Grove Dist., Jackson, Shoup & Co., are operating on the Del Pasco.

In Hassayampa Dist., a Co. of men are erecting the old Ticonderoga battery, which will be run by a water-wheel already erected.

The Benjamin, Bismarck and other lodes in the Benjamin belt are turning out well.

In Walker Dist., placer mining is "all the go." Billy Gavin is running a "long-tom," and one Co. is sluicing a little. Some 40 persons are working with rockers.

Placer mining is also being carried on with good success along Upper Hassayampa Creek.

In Maricopa county, work upon the Silver Queen and other silver ledges is being prosecuted successfully.

WALLAPAI DIST.—Cor. same: At the Keystone the breadth of rich ore in the bottom of the shaft has considerably increased and work is being pushed day and night.

Facilities for roasting ore are to be attached to the Hardy & Meacham mill at this place.

Work has been commenced on the Stark and Ewing—being the first N. W. extension of the Keystone; a shaft will be sunk on this mine to water level soon. The Fairfield, the second N. W. Ext. on the same lode is down 45 ft., exclusive of a 30 ft. cut which was made before sinking. This shaft will have to be sunk 90 ft. further before reaching water level. Work is being pushed with vigor.

A recent clean up at the mill from Lone Star rock resulted in a fine quality of gold and silver bullion. Work is still going on in a drift at the latter mine.

Colorado.

SHERMAN MT.—Central *Register*, March 13: The Zillah, Zephyr, and Elkhorn lodes, have consolidated and are negotiating to either buy, sell, or divide with the Pelican.

During the last 2 or 3 days the Fisk lode has been cut by the Bobtail Tunnel. At the mouth of the tunnel is a very fine looking pile of ore.

SOUTH CLEAR CREEK.—Owing to the severity of the weather but little has been done during the winter on Chicago Creek, or in the vicinity of Idaho. Last week Judge Dickerson commenced operations on the Andy Johnson and D. D. lodes, in Chicago Creek Cañon, 6 miles above Idaho, and is raising a fair grade of ore. On the bars below Idaho, about 20 men are placer mining with fair results. The Edgar is worked by adits on the vein at different levels, the lower one of which has been driven about 270 ft. on the vein, and carries a rich vein of ore the entire distance, from 10 to 12 inches thick. The Wild Wagoner is worked on the same principle as the Edgar. A tunnel 260 ft. in length has been run, and discloses a breast of crevice matter 25 ft. between walls. On Fall River, parties are engaged developing a silver mine that gives great promise. Assays ranging from $250 to $1,000 per ton have been made. Work on the Hiawatha tunnel, near Mill City, is progressing finely. The tunnel is about 360 ft. from the mouth.

On the "Hidden Treasure" and in the vicinity, upwards of 200 men are at work.

Palmer & Nichols' mill, the only one in operation, is running up to its full capacity.

BOULDER CO.—Cor. same: Discoveries have been made at the head of Four-Mile Creek, which promise to equal if not surpass the Caribou.

CENTRAL *Herald*, March 13: For several weeks, O. F. Barnes, S. Flint and A. Van Camp have been working the Belmont lode, situated east of the road leading from the Bob Tail hill to the Lake Gulch road. One lot, of 2½ cords of quartz yielded 50 ozs. of gold per cord in a stamp mill, and a much larger quantity gave 21 ozs.

NICHOLS, FISHER & CO.'s claim on the Kent Co. lode is improving in appearance.

MR. LAKE continues to run his mill on North Clear Creek and expects to start up the old Dickinson mill below the Boston and Colorado Smelting Works within the next 2 weeks.

CARIBOU.—Cor. same: Breed and Cutter's Reduction Works have turned out 37,000 ozs. of silver since the first of Jan. last, although idle half the time since that date by reason of defective castings, etc.

Idaho.

BULLION.—Silver City *Avalanche*, March 16: W. F. & Co. shipped from here this week 3 bars valued at $6,880.50.

LOCAL RECORD.—Last Wednesday we visited the Golden Chariot. In the winze, down 18 feet from the bottom of the 8th level, we found the ledge from 3 to 4 feet in width, of ore that would pay from $30 to $40 per ton. The vein is getting somewhat smaller further down, but is increasing in richness.

In the Ida Elmore, the winze, 130 ft. north of the shaft, is down 30 ft. for the 8th level, showing a ledge from 12 to 14 inches wide, of fine milling ore. In the south drift of the 7th level the ledge is about 2 feet wide.

Idaho *Statesman*, March 19: Curlew's claim's, near the garrison reserve, are paying handsomely. An old channel has been struck in the hills, which prospects rich.

Montana.

PIONEER. — Deer Lodge *Independent*, March 9th: Ballard & Mellen have commenced putting down a 14 inch bed-rock flume in French Gulch. Tibbits & Bro. are putting up a hydraulic on the east side of French Gulch. Carter & Co. are preparing to put down a bed-rock flume in Upper Pioneer gulch. Thomas & Co. are engaged in repairing sluices, flumes, etc., for immediate operations. Ditches are being cleaned out and everything begins to present a business-like appearance.

NEW DIGGINGS.—We learn from B. R. Parks, of Mosse creek, that new mines have been discovered on the north fork of the Big Hole. Report says that new and good diggings have been discovered somewhere on a tributary of the Big Blackfoot.

Capt. Duane, Keunedy & Co. have started a bed-rock flume on No. 6, below in Bear, and expect to finish it by April, 1st.

HIGHLAND. — Marceau & Co., at the Head of Moose, have out 200 tons of ore on the "Nonpareil." The lead is looking very well—crevice averages 3¼ ft. Shaft 90 ft.

On the "Dixie," Parks & Dickey have raised 600 tons of ore this winter, that averages $25 per ton by arastra. Depth of shaft, 150 ft.

Flowers & Wnuderlich have commoucd operatious on the "Myers" (silver,) at Highland.

The Vipond leads are looking splendid so far as worked.

RADERSBURG.—Helena *Herald*, March 14: Keating & Blacker are vigorously at work on the Kenting and Ohio lodes. They have nearly 4,000 tons of fine ore on the dump, which will average $16 per ton. Their mill will commence crushing in about 2 weeks.

Utah.

TINTIC.—Salt Lake *Tribune* of March. 22d, has the following C. T. Meader is shipping ore in large quantities from the Sunbeam, Swansea, Lucky and other lodes. A number of smelters are to start up this spring.

A. Mr. Foley has bought the Joe Bowers and is running 3 shifts of 18 men. The S. L. M. Co. has resumed work.

Holcomb has lot a contract to sink 2 shafts on his Sunbeam claim. L. J. Whitacy is about commencing work on his claim on the Sunbeam; and Moore's claim on the same ledge is yielding marketable ore.

OPHIR.—Cor. same: Over one half of the Virgin mine was sold a few days ago for $12,000. The Lizzie, close by, is a well defined lead down about 50 ft. with a good quantity of ore in the mine and on the dump.

On Chloride Hill the ore averages $300 to $400. The Chloride Queen is being industriously worked. The San Joaquin just below, and the Chloride Gem just above, are both lying idle. The Gem has a 35 ft. shaft, also a cut and tunnel, all showing the best of chloride ore. The Jupiter has been worked some of late, but only to keep jumpers off. The Gray, a promising looking lead, is soon to be proven up. The Deardon and Annie mines are being worked with paying results. The Struck It has been run in 50 ft., and a shaft is being sunk in the tunnel.

CAMP FLOYD.—Cor. same: The 20-stamp mill of the Camp Floyd Co. will be running by the first of May. The Sparrow Hawk Co. have commenced 3 shafts which they are sinking fast, as well as blasting out in open cuts and tunnels. About 1,500 tons of ore are on the dumps. The Silver Circle is reported sold for $30,000. The America shaft is 50 ft. deep, 29 of which goes through rock that assays well.

A fine seam of coal, 6 ft. in thickness, has been opened on Chalk Creek.

S. F. Stock Exchange Board.

SAN FRANCISCO, March 27, 1872.

Mining Stocks have been steady and in good demand during the week. Sales at the Board for the week ending Wednesday 20th inst. amounted to $4,309,000. On March account thus far $289,839 has been shipped from the Raymond & Ely mine. The North Oro Fino company have elected as trustees, J. W. Coleman, P. F. Bradford, J. H. H. Williams, M. Hermau and J. P. Couch. The Secretary reports a balance of $4,600 on hand. The last weekly report from the Chollar-Potosi shows 930 tons of ore extracted, assaying $37.54 per ton, and $25,386 shipped; Crown Point, 2,858 tons of ore sent to the mill valued at $159,717; Savage, 1,669 tons of ore out valued at $27.20 per ton. On March accouut $86,000 have been received from the Meadow Valley Mine. The Laue & Kurtz' Carribou Company held a meeting on the 25th inst. and the following were elected trustees: Jos. Clark, (President), J. B. Haggin, Geo. Hearst, G. D. Roberts and Ira P. Rankin. Wm. Willis was elected Secretary.

A DEEP SHAFT. — The Yellow Jacket shaft on the Comstock ledge is down to the level of the Sutro Tunnel and is being sunk deeper. The whole depth is, according to the Virginia *Enterprise*, 1898 feet, no water being found in the bottom. This is the deepest shaft on the Continent.

THE SUNFLOWER AND NITROGEN.—No plant absorbs nitrogen so rapidly as the sunflower, as ravenous as the stomach of an ostrich. A pigeon was buried between the roots of a sunflower, after some weeks not a vestige of the bird was found—the plant had devoured and digested even the feathers.

The Eureka Consolidated Mine.

The Eureka Consolidated, of Eureka District, is perhaps to-day one of the most valuable mining properties in the United States, if not iu the world. Certain are we that there is nothing in Nevada to compare with it. Late developments establish the continuity of the ore, almost beyond a doubt, for a distance of 1,000 feet; the entire length of the claim. The ore channel, which has been penetrated to a depth of 215 feet from the surface, ranges from 10 to 70 feet in width. Taking the average of the ledge, 15 square feet will yield a ton of ore. Estimating the body of ore already developed to be only 40 feet wide, 215 feet deep, and 1,000 long, and we have 300,666 tons, which, at $90 per ton, present average assays, would return the enormous sum of $27,599,940. But to he entirely safe let us reduce hoth the amount and value of the ore just one-half. This would give 153,333 tons, at $45 per ton, the gross yield of which would be $6,899,-985. That this is far below the actual value of the ore now in sight no one who has lately inspected the mine will for a moment deny. Competent judges, in fact, estimate the present availahle resources of the mine at not less than twenty millions of dollars! This, remember, is only the ore above the 215-foot level. Below that point the supply gives promise of increasing rather than diminishing. At the greatest depth yet attained the ore channel is still widening and also largely appreciating in value, as has heen demonstrated hy a great numher of assays since the late nnprecedented devolopment. The truth is, there is simply a world of ore in sight. It is gratifying to record these facts, hecause they place Enreka in the foremost rank of mining districts on the Pacific coast, there being any number of mines in the immediate vicinity of Ruby Hill, which furnish assurance of producing untold millions.

Some important improvements are to he immediately inaugnrated by the compauy, reference to which may not he out of place here. First a narrow-gange railroad is to he built from the mine to the Reduction Works at a cost of $35,000. The survey has already heen made. Two sets of steam hoisting works are to be placed on the mine, and two additional furnaces, capahle of reducing 50 tons each per day, are also to be erected. These latter improvements will involve an expenditure of abont $30,000, making an aggregate outlay of $65,000 for contemplated improvements. When the seven furnaces are once in full blast they will smelt ahout 300 tons of ore per day.—*Eureka Sentinel.*

California Wines in Europe.

Julius Dressel of the Rhine Farm, Sonoma County, writes I. N. Hoag, Secretary of the Vine Growers' and Wine and Brandy Manufacturers' Association, under date of March 5th, as follows:

Last fall I sent a box with samples of Mission and foreign wines, out of the vineyards of J. Gundlach and my own, to a brother on the Rhine. He convoked two meetings to test our California wines—the one at Geisenheim, on the foot of the famous Johannisherg, the other at Weisbaden—hoth largely attended hy men with the most cultivated wine tastes and tongues and of the highest standing as wine judges. They treated the matter deliberately, compared each sample with counter samples of their own, drafted protocols, and put down the opinion of the meeting about every single nnmber. Here is what my brother writes me as the sense of these meetiugs:

"Your Reisling of 1866 takes the first rank (there was a bravo for it). The bouquet is unexceptionahle; hesides there are strength and richness in it. Next comes Traminer of the same year, which is beautifully ripe and very fit for use. The Gutedel of 1867 (golden Chasselas) resembles most our Rhenish qualities; and the Kleinherger is agreeable light and smooth. Of the Mission of 1865, '67 '68 and '70, the 1870 pleased best. These wines of the Mission grapo are pure of taste, ripe and unctous; therefore, with their sweetness and high percentage of genuine alcohol, they may prove splendid cut-wines for onr poor sour growths of the last three crops. A lively interest was shown for the red Mission of 1869. They found it full, strong, of a marked Burgundy flavor, and approaching the taste of tho celehrated Asmannshausen.

They thought a snperior Port could be made out of it, as its bouquet surpassed the Portuguese.

The champagne of the Bueua Vista Vinicultural Society was also duly appreciated, it sparkled first rate, was not too dry, hitting the right degree of sweetness. Generally there prevailed ouly one voice among the judges, that thesewines far surpassed all expectations; and I remarked considerable progress since I tasted them on previous occasions. On an average, the taste is pure, agreeable; and they could compete with our Rhine wines of distinguished years, up to the middle qualities. They also show a very appropriate cellar treatment. All honor to your California wines.

As my brother is a recognized authority, having heen selected official judge of the wine departments of the World's Exhibition at London and Paris, and as he took only the most competent jurors, who were in earnest about the truth, I think their verdict on California wines might prove of interest.

Oriental Fan Palm.

We here present our readers a truthful illustration of one of that great family of plants known to botanists as Palmaceæ. All the plants of this order are native of tropical or semi-tropical countries, but there are varieties that will flourish and become objects of great beauty even in California where care is bestowed upon their propagation. In their native clime, they are considered among the most

ORIENTAL FAN PALM.

valuable of all the tree plants given by a kind providence to man, as affording food and raiment and numerous objects of economical importance. Wine, oil, wax, flour, sugar and salt, says Humboldt, are the produce of this family of plants; to which Von Martius adds, thread, utensils, weapons, food and habitations.

The date tree is usually classed among the palms, and the palmetto is a dwarfed variety. They grow readily from seeds. There are two varieties known as Fau Palm and the Nekau Fan Palm, that are beautifully ornamental, the seeds of which, with those of the Areca Sapida, (N. Z.) palm, and the Cordyline Indivisa, of the palm species, can be had at the seed store of E. E. Moore of this city, to whom we are under obligations for the use of the illustration here given.

Tannin in Wine.—The use of tannin from grape seed for clearing wines, notwithstanding many adverse opinions, seems to be on the increase in Europe, and *Le Sud-Est* gives reports of comparative tests which are in favor of its use. The tannin is obtained by digesting 12 loth (about ¾ lb.) of ponnded grape seed with about 1.2 lbs alcohol in a closed vessel. The mass is stirred frequently during 15 days, filtered, and the residne again treated with alcohol. One pound is sufficient for 500 gallons of wine.

Marsh lands suitable for cranberry culture, near Berlin, Wis., have advanced in value from $1 or less, to $100 per acre.

The Mining Trustees' Act.

We give helow a copy of the Mining Trustees' Act as it was finally passed by the Senate and signed hy the Governor. Under the provisions of the Act it will he seen that a majority of the stockholders may call a meeting at which two-thirds of the stock must be present, when by vote of a majority of stock, new trustees may he elected:

An Act supplemental to an Act entitled "An Act Concerning Corporations," passed April 22, 1850. The People of the State of California, represented in Senate and Assembly, do enact as follows:

Section 1. On petition of the majority of the shareholders of any corporation formed for the purpose of mining to the County Judge of the county where said corporation has its principal place of business, verified hy the signers, to the effect that they are severally the holders on the hooks of the company of the numher of shares set opposite their signatures to the foregoing petition, the County Judge shall issue his notice to the shareholders of said company that a meeting of the shareholders will be held, stating the time, not less than five nor more than ten days after the first puhlication of such notice, and the place of meeting within said county and the object to be to take into consideration the removal of officers of said company, which notice, signed hy the said County Judge, shall he puhlished daily in one or more daily newspapers published in said county for at least five days before the time for the meeting.

Sec. 2. At the time and place appointed by said notice, those claiming to he shareholders, who shall assemhle, shall proceed to organize by the appointment of a Chairman and Secretary, and thereupon those claiming to he shareholders shall present proof thereof, and only those showing a right to vote shall take part in the further proceedings. If it appears that at the time appointed, or within one honr thereafter; shareholders of less than one-half the shares are present, no further proceedings shall he had, but the meeting shall he *ipso facto* dissolved; provided, however, that by a vote of the holders of two-thirds of the capital stock of the corporations aforesaid, the Board of Trustees may be required to furnish to the meeting a written detailed statement and account of the affairs, business and property of the corporation; but if the holders of more than two-thirds of the shares are present, they shall proceed to vote, the Secretary calling the roll, and the members voting yes or no, as the case may he. The Secretary shall enter the same upon his list, and when he has added up the list and stated the result, he shall sign the same, and hand it to the Chairman, who shall also sign the same and declare the result.

Sec. 3. If the result of the vote is that the holders of a majority of all the shares of the company are in favor of the removal of one or more of the officers of the company, the meeting shall then proceed to ballot for officers to supply the vacancies thus created. Tellers shall he appointed hy the Chairman, who shall collect the ballots and deliver them to the Secretary, who shall connt the same in open session; and, having stated the result of the count in writing, shall sign the same and hand it to the Chairman, who shall announce the result to the meeting.

Sec. 4. A report of the proceedings of the meeting shall be made in writing, signed hy the Chairman and Secretary, and verified by them, and delivered to the County Judge; who shall thereupon issue to each person chosen a certificate and order of his election; and shall also issue an order requiring that all books, papers and all property and effects he immediately delivered to the officers elect; and the petitions and report, indorsed with the date and fact of the issuance of such certificate, shall he delivered to the County Clerk, to be hy him filed in his office; and thereafter the persons thus elected officers shall he the duly elected officers, and hold office until the next regular annual meeting, unless removed under the provisions thereof.

Sec. 5. For all services in these proceedings the County Clerk shall receive $10 on the issuance of the notice, and $10 on the issuance of the certificates.

Sec. 6. All Acts or parts of Acts conflicting with this Act are herehy repealed.

Sec. 7. This Act shall take effect immediatoly.

Wool Report for 1871.

We have received from Miller & Co., of San Francisco, their annual Wool Report for the last year, and as it contains many points of interest we extract therefrom. They give as the total receipts of wool at San Francisco from all sources domestic and foreign as follows:

Summary of Receipts.

Spring clip	lbs.	12,649,600
Fall clip		9,234,000
Pulled Wool		90,125
From Humboldt, Oregon, Washington Territory, and Britiah Columbia		1,187,160
From Sandwich Ialands and Australia		1,016,463
From Mexico		1,090
Receipts from all sources	lbs.	24,178,438
Add stock on hand Jan. 1st, 1871, in store, and amount held for scouring and shipped		592,470
Total	lbs.	24,770,908

Shipments.

By Railroad to Eastern markets....grosa	lbs.	20,598,694	
By Steamers via Panama	do.	2,736,707	
By Sailing vessels via Cape Horn	do.	401,659	
To Oregon	do.	103,000	
To Woolen Mills in the interior	do.	188,134	
	do.	24,028,194	

On Hand and Retained for Local Mills.

Wool on hand Feb. 29th	lbs.	21,000	
Stock City Woolen Mills 1871		2,703,000	
	do.		2,724,000
Total	do.		26,752,194

State Production.

Spring Clip received	lbs.	12,649,600
do. retained by Marysville W. M.		138,300
do. do. Merced Falls		48,000
do. do. Los Gatos Man'g Co.		11,532
do. do. Stockton Woolen Mill (estimated)		120,000
do. retained by San Jose W. Mill		None.
do. forwarded East from the interior (nett)		421,755
Fall Clip received		9,146,700
do. retained by Marysville W. M.		124,700
do. do. Merced Falls		110,000
do. do. Stockton Woolen Mill (estimated)		90,000
do. do. San Jose W. M.		None.
do. do. Los Gatos Man'g Co.		None.
do. forwarded East from the interior (nett)		436,541
[Note.—The Sacramento Woolen Mills idle during the year]. Total Fleece	lbs.	23,286,128
Pulled Wool received	lbs.	90,125
do. manufactured in San Francisco		900,000
		990,125
Total product of California for 1871	lbs.	24,276,253
do. do. 1870		19,460,565
Increase	lbs.	4,815,688

Several extensive gravel mining claims at French Corral have heen consolidated, and the owners are about to run a tunnel from the South Yuba river, so as to drain the French Corral mines. The tunnel will he ahout 2,500 feet long and will he through very hard rock.

Trade.—Some idea of the rapidity with which our China and Japan trade is growing may be gathered from the fact that last year 17,700,000 pounds of tea were received in this city, and this year 15,000,000 pounds.

Our total production of copper, in 1871, amonnted to 27,000,000 pounds. The surplus at the beginning of the year was 10,700,000 pounds and at its close 5,700,000 pounds. The consumption is thus shown to be increasing faster than the production.

Good Health.

Brandy as a Medicine.

Brandy kills thousands every year who were healthy before they began the use of it: then it seems fair to infer that it will kill the sick more speedily.

Dr. Lees says that he was living near Buckingham Palace, in London, where Prince Albert was taken sick. His case was doing well for a few days, when they began the use of brandy to strengthen him, to enable him to recover more rapidly: the more he was stimulated, the worse he grew until he died. It is true that they thought it was the best thing for him, but their thinking so did not make it so.

Some years ago when it was the custom to attempt curing *delirium tremens* by giving brandy, one out of every four died at Edinburg Hospital. Since then, the professor of the medical department has treated 300 cases of *delirium tremens* without alcohol, without losing a single patient.

Professor Gardener, of the Glasgow University, gave a hundred men thirty ounces of alcohol: seventeen out of the hundred died. Another hundred were allowed only three ounces, and eleven died out of the hundred. Of 209 cases of young persons, who were not allowed either wine or whisky, not one died.

In a teetotal hospital in Leeds, of 300 patients who took not a drop, all recovered. Let facts decide.—*Hall's Journal of Health.*

When do Men Die?—Medical experience proves that in chronic diseases the greater number of deaths occur just before dawn. This is eminently true of brain disease, and of those related cases where death results from an exhaustion of the vital power through overwork, excessive excitement or nervous prostration. It is at the hour of five o'clock in the morning that the life force is at its lowest ebb, and succumbs most readily to the assault of epilepsy, or paralysis, or of the fatal lethargy that comes in those vividly beautiful picture-dreams, of which medical science has as yet found no name, and of which it has taken no sufficient cognizance. Nine-tenths of those who die in this way expire in their sleep. Men who do brain work, and who are on the shady side of forty, should be on their guard against this insidious enemy. They should beware of five o'clock A. M., for it is a perilous hour. Do you find yourself unable to sleep when you retire for the night, exhausted with your day's work? Do you, in vain, turn from one side to the other? Does your brain persist with working when you would fain have it rest? Do old saws and scraps of rhyme repeat themselves in your memory with wearisome iteration, defying your utmost efforts to silence them? Then, I say to you, beware! You will be sure to sleep at last. It is only a question of time, for, soon or late, nature will assert her rights.—*Ex.*

High Heeled Shoes.—The *Examiner* of this city, recently denounced in very proper terms the prevailing fashion of high-heeled shoes, by which our young girls are weakening their ankles and spoiling the shape of their legs. It says:

Every day in the streets of San Francisco, or any other city, we suppose, can be seen human beings of all ages limping along in painful grotesqueness, instead of treading the earth as if they possessed the divine right to trample dirt under foot. It is with little expectation of influencing any man or woman to abandon high-heeled boots and shoes—for we know the obstinacy of both sexes in all matters pertaining to fashion—that we continue our remarks. But no man of observation or sensibility can notice without pain the young of either sex passing him on the street, every hour in the day that he may chance to be abroad, with the distortion of the ankle—the constant projection ont of the proper line of the lower limbs, without feeling a pang of regret that so much of future misery is being needlessly, through the demands of a senseless fashion, entailed upon our race.

Throat and Lung Diseases.—Most of the throat and lung diseases, which indirectly lead to consumption, are occasioned by sheer carelessness. A delicate woman often sits for two or three hours in a crowded theater or church, breathing an atmosphere tainted by the exhalations from the lungs of hundreds of other people, her system is exhausted, her skin is excited by unwonted action, and when she leaves the building and goes out into the cold air her blood is suddenly driven to the interior of the body, and then ensues a more or less permanent congestion or inflammation of some of the internal organs—usually the air tubes in or leading to the lungs. This process being repeated many times, a chronic bronchitis is finally established in persons otherwise healthy, and life is ever after rendered miserable by this periodical overheating and sudden chilling of the body, even if the more dangerous malady, consumption, does not interfere, and put the abused body into the grave.

Useful Remedy.—On good authority it is promulgated abroad that two drops of turpentine oil in a little milk is a complete antidote to phosphorous poison. Children not unfrequently bite off the charged end of phosphoric matches and swallow them. It is stated that a girl was recently saved in England by this newly discovered remedy, who had actually eight match ends in her stomach.

Critical Periods of Human Life.

From the age of forty to that of sixty a man who properly regulates himself may be considered in the prime of life. His matured strength of constitution renders him almost impervious to the attacks of disease, and all the functions are in the highest order. Having gone a year or two past sixty, however, he arrives at a critical period of existence; the river of death flows before him, and he remains at a stand-still. But athwart this river is a viaduct called "The Turn of Life," which if crossed in safety lends to the valley "Old Age," round which the river winds, and then flows beyond without a boat or causway to effect its passage. The bridge is, however, constructed of fragile materials, and it depends upon how it is trodden whether it bend or break. Gout, apoplexy, and other bad characters, are also in the vicinity to waylay the traveler and thrust him from the pass; but let him gird up his loins, provide himself with perfect composure. To quote a metaphor, the "turn of life" has a turn either into a prolonged walk, or into the grave. The system and power having reached their utmost expansion, now begin either to close, like flowers at sunset, or break down at once. One injudicious stimulant, a single fatal excitement, may force it beyond its strength; whilst a careful supply of props, and the withdrawal of all that tends to force a plant, will sustain it in beauty and vigor until night has nearly set in.

A Remedy for Baldness.—The bald may now take courage and smile at the frequent summer fly. It is no new lotion that is to bring back the hairs of their youth and innocence, but a system of planting hairs in the smooth skin of the head, exactly as cabbages are set out in the garden. A discoverer, whose name cannot be long concealed from a grateful world, has invented a plan of replanting the hair where it is lost. As plants grow so does the hair. It is rooted and thrives like a vegetable. The operation of restoring hair is very simple: put healthy hairs into the eyes of needles and draw the needles through the upper skin, the epidermis; being drawn through, the hairs are left in the skin, as a thread may be left in any material by a stitcher. The roots, which have been extracted with their bulbs complete, are brought under the epidermis. The surface so operated on is protected at first by a linen band, but the hairs soon take root, grow, and flourish. It is not stated whether having the skin punctured in this way is disagreeable, and how often it is fatal. If it is a success, the plan has many advantages; one can have any color of hair he may elect, and he can plant a variety of colors, and thus make his appearance striking and beautiful.—*Hartford Courant.*

A Good Remedy for a Cough.—Take a handful of hops, put it in to three pints of hot water; let it boil one-half hour, or until the strength is out. Then strain, and add one and one-half cups of best kind of molasses, and one cup of white sugar. Then boil down slowly in a bright dish, or enamelled kettle, to about one quart. Then bottle up, and it is ready for use. Drink a little when you cough.

Suitable Dresses.

As for dresses suitable to certain persons, I need say but little. There are many books on the etiquette of dress, showing what is proper to be worn in the morning and in the evening and at noonday. A few very simple rules will suffice here. Those who are very stout should wear nothing but black; those who are very thin should put a little padding in their gowns; and neither should be in the least *decollettee*. Perpendicular stripes in dresses give hight, and increase fullness, and are therefore particularly suited to very slight, small people, and particularly unfited for stout figures. To fair persons, blue is becoming—but not every blue. Dark blue, or two brilliant a blue, is extremely unbecoming to that kind of complexion, and makes the skin yellow and the hair sandy. It is the old, pale, dull blue that really makes sand gold. Pink, especially the old-fashioned yellow pink, is, when not two brilliant, becoming to to all complexions except that which goes with red hair. Light green may be safely worn by the very dark, the very rosy, and by the very pale when the skin is extremely clear; but to ordinary English faces it is a trying color, though there are people who look well in nothing else. Green, mixed properly with pale blue, is very becoming indeed. Gray is the most becoming for old and young—I mean the soft silver gray which is formed by equal parts of black and white, with no touch of mauve in it. It admits of any color in trimming, and throws up the bloom of the skin. Rose-color, for some people, is pretty, and not unbecoming. White, so disastrous to rooms, is generally becoming in dress—only very coarse complexions are spoilt by it. Short women should never wear double skirts or tunics—they decrease the hight so much; unless, indeed, the tunic is very short and the skirt very long. So also do large, sprawling patterns used for trimmings. Let these be left to women tall enough to carry them off. Neither let a very little woman wear her hair half down her back; let her lift it clean up as high as possible.—*St. Paul's Magazine.*

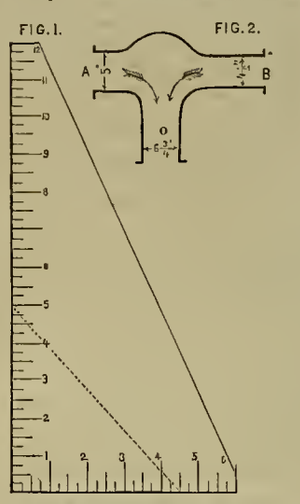
M. K. Young, of Grant Co., Wis., has come to the conclusion that mules make the best farm teams, after having tried light and heavy horses.

Useful Information.

The Proportion of Pipes.

We subjoin a sketch of a handy little contrivance, designed by Mr. George Cockburn, pattern-maker, Glasgow, for ascertaining the diameter of a pipe, etc., having a sectional area equal to that of two other pipes, or *vice versa*. The instrument consists simply of a piece of wood on cardboard shaped like a set square, as shown in the accompanying diagram of the same form drawn on paper; and divided out along the two edges which are at right angles to each other, the divisions being taken to represent inches, feet, or yards, etc., according to the kind of work for which the instrument is used. When employed for determining the equivalent diameter of pipes or bars, inch subdivisions will generally be found most convenient.

The mode of using the instrument will be readily understood from an example. Suppose for instance that two pipes, A and B (Fig. 2) respectively 5 in. and 4¼ in. in diameter, deliver into a third pipe, D, and it be required to find the proper diameter for the latter pipe. Then from 5 on the scale of one of the divided edges to 4¼ on the other draw a line, as shown dotted in Fig. 1, and the length of this line measured with the same scale as that to which the edges are divided will be the diameter of pipe required, in this case 6¾ in. On the other hand, if a pipe, D, 6¾ in. in diameter, be delivered into a pipe, A, 5 in. in diameter, and it was required to know what other size of pipe, B, could also be supplied, all that would be necessary would be to take the division



point 5 on one edge as a center and with 6¾ in. as a radius, describe an arc cutting the other divided edge. The point at which the latter edge was cut by this arc would show the diameter of the pipe required.

Besides being useful for determining the diameters of pipes or circles of equivalent areas, the instrument is also available for determining the sides of equivalent squares, while by a little contrivance it can be made available for determining the diameter (or length on the side if square) of a pipe or bar having a sectional area equal to the aggregate sectional areas of any number of other pipes or bars of which the diameters (or lengths on side if square) are known. To use it for this purpose it is only necessary, first, to determine by its aid the diameter of pipe or bar equivalent to any two of the whole number, and next to ascertain the equivalent of the diameter thus ascertained, and that of a third pipe or bar, and so on. The arrangement of the instrument is, of course, founded on the fact that the areas of squares and circles increase as the squares of their sides and diameters respectively, and that the square of the hypotheuuse of a right-angled triangle is equal to the sum of the squares of its two sides.

Mattress Making.—Whether they are filled with hair, or flocks, or straw, the process is similar. They are made in a frame the sides of which are bored with a ¼ in. bit about every 3 in.; same with the posts, so that they may be altered to make any sized mattress. If the mattress is for a wood bedstead, a square block is put in each corner of the frame, and the straw is rammed hard to it, so that the corners may be square, and fit the bedpost. For iron bedsteads, no corner blocks are used. A material called "farfar" is generally used for the upper and under sides, and for a better mattress brown holland. For the edges, bed ticking cut across the piece, and about 6 in. wide, will do. The tufting down is generally done by girls, on a table with laths for the top, so that the mattress needle, which is about 10 in. long, may be passed through.

India Rubber Carriages.—A company is putting up a large factory in Fairfield, Ct., and will shortly engage in the building of carriages made entirely of India rubber, except in axles and tires. A decided superiority is claimed for the material over wood.

The manufacture of rails in this country has just doubled in the last six years.

Light in Darkness.

The Paris *Figaro* gives the following method of obtaining light instantly, without the use of matches and without the danger of setting things on fire: "Take an oblong vial of the whitest and clearest glass, put in a piece of phosphorous about the size of a pea, upon which pour some olive oil, heated to the boiling point, filling the vial about one-third full, and then seal the vial hermetically. To use it, remove the cork, and allow the air to enter the vial, and then recork it. The whole empty space in the bottle will then become luminous, and the light obtained will be equal to that of a lamp. As soon as the light grows weak its power can be increased by opening the vial and allowing a fresh supply of air to enter. In winter it is sometimes necessary to heat the vial between the hands to increase the fluidity of the oil. Thus preparing the vial may be used for six months. The contrivance is now used by the watchmen of Paris in all magazines where explosive or inflammable materials are stored."

The Steam Sand Jet has been applied to new and important uses in Philadelphia, namely, wood engraving, the decoration of marble and the cleaning of brass castings. To engrave upon wood with the sand blast, it is necessary to photograph the object to be reproduced upon the prepared surface of the block, and this being exposed to the blast with certain precautions, is engraved in a few minutes. It is stated that specimen engravings are soon to be published, which will afford the public an opportunity of comparing the work done by the sand-jet with hand work. If the claims of those interested in the process are well founded, the introduction of the new system will greatly reduce the cost of wood engraving.

Purifying Water.—It is claimed that metallic iron affords the readiest and simplest means of disinfecting water, and of keeping it fresh. The water of the Thames, taken to the sea in iron tanks, soon becomes perfectly sweet, and remains so during a long voyage. A small piece of iron or a few nails in the water in which cut-flowers are put will keep the water sweet. The experiment has been tried of putting some iron-fillings in a vessel with a very small quantity of water and then placing a leech therein. After six months had passed, the water was found quite fresh, and the leech alive and healthy.

Mechanical Hints.

To Restore Furniture that has been marred or scratched:—Purchase one pound of beeswax, and scrape it into shavings in a pan; add half a gallon spirits turpentine, and one pint linseed oil. Let it remain twelve hours, then stir it well with a stick, into a liquid; while stirring, add one quarter pound shellac varnish and one ounce alkanet root. Put this mixture into a gallon jar, and stand it before the fire, or in oven, for a week, (to keep it just warm), shake it up three or four times a day. Then strain it through a half sieve into half and quarter pint bottles, corked and sealed with pretty label in front. Pour about a teaspoonful on a wad of baize, go lightly over the face and other parts of mahogany furniture, then apply a similar wad, dry briskly, and in three minutes it will produce a dark brilliant polish unequaled. This receipt is of great value.

Another Preparation may be made as follows:—Make a mixture of three parts linseed oil and one part spirits of turpentine. It not only covers the disfigured surface, but restores wood to its original color, and leaves a luster upon the surface. Put on with a woolen cloth, and when dry, rub with woolen.

Tempering Spiral Springs.—Take oil and put it into anything you have of the size for dipping your job in, two inches deep, add water with about one ounce of common washing soda to the pint, about two inches deep. Have a tube to heat your springs in, or a better way, make the tube red hot and insert the springs, and when hot toss them into the prepared bath. Take carefully out and put into a tin. Cover with oil, and put over the fire until it boils and catches fire. It will first burn blue. Keep it there a few moments until it boils clear and bright; then slack down by plunging it into oil altogether. You will find them the right temper for springs for any purpose.

Watch Cleaning.—A correspondent says:—"To clean a watch, even if it be of the lowest grade, the barrel or mainspring box should always be taken apart, the arbor and spring taken out and cleaned, fresh oil being applied before the cover is replaced. That there is nothing better than naphtha for cleaning purposes, is the opinion of most watchmakers. If the watch has a fusee, that also should undergo the same treatment as the mainspring box. The pivots also form an important part of the mechanism of a watch; and, to be examined as they always should be, necessitates the act of taking the watch apart. Such attention, no honest practitioners will overlook."

In the fourteenth century the average yield of wheat in Great Britain was only ten bushels per acre. Now lands in our older States have been reduced to about the same average, but the average of Great Britain now is about three times that amount.

MINING SUMMARY.—Reports from Mines in various States, Counties and Districts; Stock Reports, Markets, Etc., 196-7.

CHASING A METEOR.—During the passage of a meteor in Mexico lately, the observations were taken at different places and the progress noted by means of the telegraph, from one point to another. The *American Journal of Science* for March contains the reports of its appearance and time in traveling between different places. Forty-five minutes elapsed from the moment the meteor was observed at Mexico, till the moment it made itself visible at Vera Cruz, 320 Kilometres distant. Truly, electricity can be made subservient to many uses, but this is the first time we ever beard of it "heading off" a meteor, like a runaway casbier.

COAST REVIEW.—We have received a number of the *Coast Review*, a monthly journal heretofore devoted to insurance interests alone, but which has added a mining department. Among the articles is one headed "Our Mining Prospects," credited to the *Bulletin* of the 12th inst., which was taken by that paper from the SCIENTIFIC PRESS of the 9th, without the usual courtesy of saying where it came from. The *Review* has a large field and we wish it success.

MINING ENTERPRISE.—J. T. McClean Esq., has purchased a gravel claim in Table Mountain for $2,000. The *Democrat* says he has let a contract to get in water enough for working it by hydraulic power, which will cost $12,000.

RECEIVED from L. M. McKenny, Sacramento City Directory, and Gazetteer Directory of Central Pacific Railroad for 1872.

ON FILE.—"Notes of Travel in Nevada Co.," L. P. Mc.; Communication from "Exile."

The Mining Incorporation Law.

We give in another column the full text of the new mining incorporation bill as signed by the Governor. It has already become practically inaugurated by the stockholders of the Savage Mining Co., who held a meeting last Saturday, ousted the Trustees, and elected a new Board. Moreover there are a number of changes contemplated in which the same action will be taken. Still, where the Trustees control one-third of the stock no such thing can take place, and if they do not, they will resign rather than undergo the unpleasant notoriety of being ejected. There is no doubt but the law will enforce and create more respect for the wishes of the majority than has hitherto been shown by Trustees, since they now have the power to insist on desired measures under penalty of removal. The law will undoubtedly reform some of the old abuses which stockholders were subjected and afford additional safeguards to persons interested in incorporated mining companies. The loose management which has been experienced by many companies can now be remedied, for under the old system Trustees were elected for one year, competent or not, honest or unreliable, whereas now, if the stockholders are dissatisfied they can remove them and substitute new ones till they get a Board that does suit.

The ring system, which has done so much to discourage legitimate mining enterprise has received a check by the passage of this bill, for other parties have some voice in the way matters are managed as well as the Trustees, by having the power to remove them when any symptoms of artifice become apparent. Those who are really honest and reliable men and who manage their business properly, in the interest of the parties they represent, will be sure to meet with proper appreciation, while objectionable men will seldom hold the position of trustee more than once. Incorporated companies, with Boards of Trusteos, are necessities which cannot be done away with, for mining of all kinds requires capital which can be procured in no better way, than by consolidation of means; still stock operations should be conducted with honesty and fair dealing so that the unsophisticated speculator with small means should have some other chance than that of losing his money. Information concerning developments, or strikes in mining ground is as much the property of one stockholder as another, still we continually see examples where such information is withheld until the trustees, who are supposed to protect the interest of the company, have been able to buy stock at low prices, and then sell out, when the strike became known, at a large advance. This, oftentimes, with the company's money.

The operation of this law will do much to uphold and assist the most prosperous and best paying business on the Pacific Coast, that of mining, for parties who have heretofore looked upon it as a very dangerous speculation, will now enter the field with more confidence, being assured there are legal rights to stockholders which trustees are bound to respect. Stock speculations, of course always will exist, and fraudulent transactions will occurr, so it is very little use to talk about them, but parties who go into mining companies for the purpose of legitimately working a mine, and who expect their profit in the form of dividends, rather than fluctuations of stock, are afforded more protection than ever before in former years.

RESPONSIBILITY OF STOCKHOLDERS.—The committee on corporations, in the Senate have reported favorably on the bill to regulate the responsibility of stockholders.

Mechanical Genius.

A London critic of high literary attainment, speake of Joaquin Miller as the "uneducated poet," declaring that the "poet was born in him, irreepective of the advantages of education to bring it out."

The same might be said of the mechanical genius of thousands of the boys of our land, including the "hoodlum" element. Much of true mechanical genius now lies dormant and may ever remain so, for the want of some system of encouragement, education or training, some little help to its development.

The State of Massachusetts ever awake to the importance of the education of her sons, is moving in the right direction, by instituting as a branch of her educational system, schools in which the poorer classes may be taught the rudiments of mechanical trades, with the view of drawing out anything like a latent genius, that may be slumbering in minds that but for help thus afforded, might be lost to themselves and to mankind.

Mechanical genius and invention is making rapid develpoment in California as shown by the records of our own company's patent agency, and yet our Legislature at the instance of the people, could do nothing better for the educational interests of our State, than lend every encouragement within the scope of their authority, towards the fostering of a mechanical branch of our educational system.

Steam Plows vs. Horse Plows.

The Vienna *Ldw. Ztg.* containe an official report of some experiments with steam cultivation made in 1870 to 1871, in Altenburg, on lands belonging to the Grand Duke Albrecht of Austria. A field was eelected and divided into sections of from 6 to 30 acres in each manner as to make the comparative trials as fair as possible. Some of these sections were plowed with the aid of horses in the common manner, while on others steam plows were used. The land was plowed at the end of June, 1870, and then left untouched until the spring of 1871, when it was planted with beets. The following is the yield per acre of the sections plowed.

With Horse Plows	10 to 12 inches deep	.....	12,683.5 lbs.
With Steam Plows	12	"	.....17,796.4 "
With Steam Plows	17	"	.....22,353.5 "
With Steam Cultivators	10 to 12	"	.....15,400.5 "

Showing an increased yield in favor of steam cultivation of 40, 76 and 24 per cent. respectively.

"The experimental sections were chosen adjoining one another in such a way that difference in the soil could have had no great influence on the increased yield, but only the more perfect work obtained by steam cultivation."

California Butter Going to the East.

On the Saturday evening freight train of the Central Pacific Railroad there went forward a cargo of California butter—and invoice of 20,000 pounds—forwarded by Wooster & Shattuck, and consigned to John S. Martin & Co., and T. S. Doremus and Co., New York—to go through in sixteen days. This lot of butter is intended to show our Eastern friends that we have articles to export of which California has heretofore been a great importer, and the shippers have taken pains in putting up this lot of butter in a manner to do justice to the Point Reyes dairies. A small lot of butter—over 600 pounds—not at all to compare with this in quantity, was shipped a year ago, and then attracted a good deal of attention, winning favorable and lengthy notice from the New York *Tribune*. Our early spring enables our dairymen to enter the market a month earlier than can be possible for the dairymen in the colder climates on the other side of the mountains, and as our grasses at all times give the butter a better flavor than any Eastern article, it is expected that this shipment will result in a demand for more, or at least will check consignments to this side, now somewhat too numerous. Messrs. Wooster & Shattuck deserve credit for making this venture, and for the pains taken to increase the reputation of California as a producing State, able to compete with other localities in articles with which it was intended to overrun this market when the railroad was completed.—*Alta.*

Coal Ashes.

A subscriber asks if coal ashes are of any value as a manure for grass lands, or field crops.

Coal ashes contain no potash, and as this salt is what gives to wood ashes the principal value it has as a manure or fertilizing agent, it is not worth the cost to apply coal ashes to land. The only exception may be, when applied to stiff clays, its mechanical effect is then to loosen the soil, but other than this, adds nothing to its fertility. Wood ashes leached or unleached is a valuable fertilizer applied to any soil or crop, except where the alkali of potash is already abundant in the soil.

New Publications.

We have received from Bancroft & Co., Market street, "A Treatise on Punctuation," by John Wilson, designed for letter writers, authors, printers, correctors of the press, and for the use of schools. It contains an appendix embracing rules on the use of capitals, a list of abreviations, hints on the preparation of copy and proof-reading, etc., The work has been in use in a number of leading institutions of learning for some years, and is of value to all who desire a clear understanding of the subject of which it treats.

"Æsthetics, or the Science of Beauty," by John Bascom, from same publishers, contains 16 lectures which the author says were written with a desire to supply the want of an exclusive and compact treatise on the principles of taste. It is designed to aid the ordinary student of the beauties of the external and ideal world, and to give him a proper appreciation of the beauties of Nature and art.

"A Compendious Dictionary of the Greek Language," by Alpheus Crosby, is intended to supply what was believed to be a desideratum in the list of Greek text-books, viz., a grammar which should be portable and simple enough to put into the hands of the beginner, and which should yet be sufficiently scientific and complete to accompany him through his whole course.

"The Teacher's Guide," companion to Bartholomew's Drawing Book, No. 1, from same publishers, is intended for teachers and scholars using Bartholomew's drawing books (which we have also received.)

Hanna's Complete Ready Reckoner, Log Table and Form Book," from A. Roman & Co., No. 11 Montgomery street, contains a complete set of tables for the measurement of all kinds of timber, lumber, etc., in all kinds of ways, to which is added a table of wages, rent, board, or other expenses for any amount per day for any given number of days, interest tables, business forms, etc.

Oregon Looming Up.

No longer that out of the way place on the face of the globe, Oregon, from the indomitable energy of her people and the grand system of railroads now being inangurated and rapidly pushed from point to point in her wide domain, is, as a State, assuming an importance that cannot but attract the attention if not the envy of some of her older sister States. Her cities and towns have awakened to renewed life and activity, her population is rapidly increasing, and other evidences of a progressive and prosperous future, from this day onward are apparent on every hand.

A similar spirit of enterprise with like results, seems also to have seized upon the people of Washington Territory, where new and vast improvements are already in progress, that will have no relapse till a developed country and a mighty people be found where, and of which, but a few years since we knew but little more of, than as the great North West.

The Thresher's Guide and Farmer's Friend.

The above is the title of a work by D. W. Hollihan, soon to be issued from the press of Dewey & Co. It is probably the finest work of the kind ever printed, and will contain full and complete directions for the management of field threshing machines; the setting up of the same in the field, the care of every part of the apparatus; how to prevent accidents and delays, by pointing out the causes of the same; the application of horse and steam powers, and their management with full instructions for keeping all parts of a complete threshing establishment in perfect order, and at the least possible cost of time, labor and money. It will be a work so complete that every farmer who owns or employs a threshing machine, will find the purchase of a book a good investment.

SEVERE EARTHQUAKE.—Quite a severe earthquake was experienced about half-past two o'clock on Tuesday morning, which, in some portions of the State was prolonged to a most unusual length of time. Its effects were also felt over a much larger area of territory than is usually the case with earthquake shocks in this State. The movement was felt in a north and south direction fully 500 miles, and something over 150 east and west. Had the violence of the shock been proportioned to its prolongation, the results would doubtless have been quite serious; as it was, we hear of no material damage, beyond the slight cracking of a few walls, etc.

Mining Accidents.

Frank Trevilyan was hnrt by a rock falling on him in tbe Idaho mine, Grass Valley, on tbe 14th inst.

G. W. Stover, says Jacksonville *Ledger*, was caved on and seriously injnred, in his tunnel near Volcano last week.

A miner named Pollock, working in the Overman mine, lately had a narrow escape from death. Ho was working in the bottom of the shaft when the cage came down npon him hrnising him hadly and hreaking soveral bones. He is expected to recover.

T. A. Haskell, engineer at the Pappoose mill, Lower Gold Hill, was seriously injured about the bead and eyes hy a somewhat peculiar accident, the result of the explosion of one of the amalgamating pans. According to the *News* the mill had been shut down for a few days, during which time gas was generated from the chemicals at tbe hotoom of the pan, beneath the pulp, and when the mill started up, and the mullers hegan to revolve the gas burst through the pulp, taking fire as it did so.

Ben Hollander was caved upon and had his leg hroken in Harmard, Camphell & Co's. claims, at Rattlesnake, Placer Co., on the 21st inst.

Clark Hughes was killed hy the promature explosion of a blast in a mine near Virginia City, M. T., two weeks since.

Wm. Brand was severely injured on the 16th inst. by falling with a car over the dump of the Star of Nevada tunnel, according to the Reese River *Reveille*.

A man named Snllivan was caved upon in a claim at French Gulch, M. T., a short time since, hnt escaped with a few hrnises.

Martin Beckman was killed by a cave in the Oro claim, Forest Hill, on the 25th inst.

A miner named Alexander McElrath, while at work putting in timhers in tbe South Amador mine, Sutter Creek, on tbe 25th inst., was killed by a timber swinging around and crushing his head.

Edward Talhot, working in the Belcher mine, rceeived severe injuries on tbe 25th inst. from a stone falling on his head.

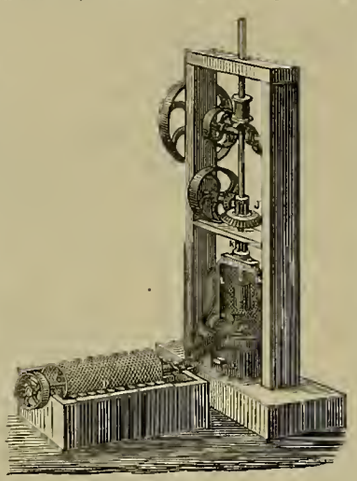
INVENTOR OF THE PNEUMATIC DESPATCH. It would appear that the inventor of the Pneumatic Despatch System was Dr. A. M. Schmitt (now alive) of Mayence, who is said to have been led to tbe idea by the "bean hlower" so familiar to all schoolboys. He first snbstituted messages, written on paper and rolled into balls, for beans. He then substituted long iron tubes for the ehort tin or glass tuhes, and used strong bellowe to blow tbe messages througb the tuhe. An apparatus of tbis kind for besieged plaees, for eending messages to troops making a sally, was used by him in 1832. His next idea was to use two bellowe, one for forcing air into, and one for sucking air out of, the tube; hut for these he soon substituted air pumps. And he finally euggested the nse of two tubes, as is essentially the system now employed. The professor's ideas were never carried out to any extent by those to wbom he propounded them, and the syetem was negleeted for years until otbers took it up. But to Prof. Schmitt the honor of priority seems due, and the people of Mayence have proposed presenting him witb some token of their respect for his inventive genius.

TIMBER LAND.—A Justice of the Peace, named Leavesly, has heen arrested in Gilroy by the United Statee Secret Police, on a charge of unlawfully cutting timber on Governmennt land. He is charged with going outside his own claim and cutting 500 trees valued at $1 each. As this is the first case of the kiud here, great interest is felt in the resnlt as it will affect a large number of persons.

An Improved Quartz Mill.

The accompanying illnstration represents an improved qnartz mill of peculiar constrnction which is intended to obviate some of tho difficultios met with in the ordinary stamp hattery, and to effect a reduction in original cost and practical working. It consists in the use of two or moro circular mortars having inclined floors, and provided with scrapers which revolve in a horizontal plane about the stamps, so as to carry tho rock to the center and honeath the stamps. From these mortars the pulverized rock passes out throngh coarse circular screens to a cylindrical screen which revolves on a horizontal axis. The finer part of the pulp thon passes through into hoppers honeath, and from these it is carried to the amalgamators, whilo the coarser particles which will not pass through the screon, will he disehargod at the end into a hopper, from which they are conveyed to still a third mortar where it is so pulverized as to pass through the snrrounding fine screen.

The pulley, cams, tappets and camshaft, are arranged as in an ordinary battery, and although only one is shown in the cut, it is ohvious that any number



STILES' QUARTZ MILL.

can he used. The mortar is made with an inclined bottom and the die, *F*, ie placed in an opening in the center. Whenever it is necessary to remove tbe die, it can be done hy inserting a wedge in tbe opening ehown at *G*. A pulley ie geared to the cam-sbaft, and by means of a belt drives tbe gear, *I*. Thie gear in turn moves the gear, *J*, which is secured to the the sleeve, *K*, so that it turns freely ahout the stem. Bent arms, *L*, are eecured to the sleeve, *K*, and carry at their lower ende the scrapers, *M*, *M*, which serve to move tho contents of tbe mortar toward the center so as to carry it all under the stamp. When eufficiently pulverized tbe pulp passes through a coarse circnlar screen whicb eurrounds tbe mortar, and from this it slides down into the epout and is discharged into the horizontal cylindrical screen, *P*, whichie revolved partly under water, so that the particles will be carried through the screen during its revolutiou and fall into the boppers arranged helow.

A sort of hrush or scraper is set so as to bear against one side of the screen and remove any particles of sand or other matter that may chance to become wedged in tbe meshee of the screen, and tend to ehoke it so as to prevent tbe passage of the pulp. From tbese boppers tbe finely gronnd pulp is carried tbrough small tubes or pipes, which conneet with the bottom of tbe hoppers into a trough below, and from tbis it is conveyed directly into vats or otber receptacles where amalgamation is accomplished. The coarser particles, not being ahle to pass through the revolving screens above mentioned, are carried out tbrough the end of tbe screen, and fall into anotber hopper from which they are carried hy small tnbes, as before described, to a third battery, where they are further redneed hefore heing sent to the amalgamating vats.

By the nso of tho cirenlar screen a much larger discharge surface is ohtained while the die is only an inch or so helow the discharge. The revolving arms, hy which the rock is swept to the center and immediately nnder the stamp, are convenient and usefnl, while the necessary machinery to work them is simple and light. A correspondent of the *Bulletin* who has seen one at work says that actual experiment reveals a crushing capacity of 440 pounds of rock in 45 minutes, or ono ton in ahout fonr hours, instead of twelve, as hy the old way. Tbe invention was patonted tbrough the SCIENTIFIC PRESS Agency, hy William C. Stiles, of Nevada City, Cal.

DIED.—At San Antonio, Monterey County, March 5th, Thomas Rowlandson, C. E., F. G. S.

The snhject of the ahove brief announcement was well known to many in tbis city and State as a man of no ordinary scientific attainments. His name has often appeared in the columns of tbe SCIENTIFIC PRESS, and other papers of this city, as a writer upon scientific, commercial and indnstrial matters. As an agricultural writer, npon certain special snhjects, he had few eqnals in this, or any country, as is fnlly testified by nnmerous prize essays which he wrote in England (his native land) before coming to this conntry.

Mr. Rowlandson was at one time a prominent esndidate for an important professorship in tbe University of Edinburg, and wonld undoubtedly have been elected on his scientific merits, against all competitors, hsd not Prince Albert signified his personal preference for an intimate friend who was also a candidate. Tbe royal wish was of course granted. Had it been otherwise, Mr. Rowlandson would undoubtedly have been spared the misfortune of an unsuccessful adventure to California, and a deatb among comparative strangers, and in a strange lsnd.

Mining Companies Reports.

THE HALE & NORCROSS mine prodnced last year 48,571 tons of ore. The amount redneed was 49,625 tons averaging $17.40 per ton, yielding altogether $862,701. It cost to work this ore $539,905, or about $10.88 per ton. The Hale & Norcross used to be one of our prominent mines and has turned out during the last seven years $7,206,540 in bullion. The mill-men lately have made more out of it than the shareholders.

THE JACKSON MINING CO. held their annual meeting on the 25th inst., and elected as trustees, J. D. Fry, A. K. P. Harmon, A. E. Head, R. Sherwood and C. L. Willer. The receipts amounted to $42,347, of which $18,808 were from bullion, $20,391 from assessment and $3,148 from other sources. The disbursements amounted to $50,150, of which $24,356 was for labor. The expenditnres exceeded the income by $7,803.

WOODWARD'S GARDENS.—The late fine weather has added largely to the number of pleasure and health seekers at Woodward's Gardens. The latest attraction to this popular place of resort is several live alligators—two of which weigh 1,200 and 1,000 pounds respectively. One of these huge reptiles died on Friday of last week; but the other is still disporting himself in a huge tank, as such an amphibious mouster should.

RAMIE CLEANING MACHINERY. — Mr. T. H. Murphy, of New Orleans, La., claims to have invented machinery that can be worked in the field to clean, the fiber like dressed flax, from one to fifteen acres per day, only requiring from two to five men, with suitable horse or steam power.

A PAYING MINE.—The shipments of bullion from the Raymond & Ely mine from March 1st to 28th, amounted to $10,700 per day.

AT the recent Wine Growers' Convention in Sacramento, it is said by competent judges, that the most delicate wine offered for examination, was made at Coloma, El Dorado county.

Accumulation of Tailings.

In "Mines, Mills and Furnaces," the Mining Commissioner's last report in the chapter on Deep Placer Mining in California, by W. A Skidmore, some interesting facts are given, concerning the "Accumulation of Tailings," as follows:

"As an example of the extent of their accumulation, we will take Bear River. This stream has been filled to a depth of nearly 80 feet in the center, and its former hanks so far covered that tall pine trees, formerly far above the stream, have been gradnally engulfed season after season, until now only the top hranches appear above the current. It is helieved that these tailings contain enough gold and quicksilver to pay a handsome profit for their removal if any outlet could be found.

Mr. Uren, of Dutch Flat, a civil engineer and surveyor, has made a reconnaissance of the country hetween Bear Rivor and the North Fork of the American River, and states that a tunnel could he run through the divide hetween these streams which would not exceed in length one and a half miles. As the American River runs throngh a gorge several hundred feet lower than Bear River, this tunnel would empty Bear River and its trihutaries and open millions of cubic yards of hydraulic ground now without outlet, which otherwise can never yield up its wealtb. The quantity of tailings in Bear River and its confluent gulches alono, above the mouth of the supposed tunnel, estimating, on an average width of 300 feet, a depth of 75 feet, and a length of ten miles, would be 44,000,000 cubic yards. We know that in early times a large proportion of tbe gold and quicksilver was lost; perhaps 20 per cent. would be too low an estimate of such losses. Of late years the proportion of gold and quicksilver carried off in the tailings has been smaller; the amount conld he approximated by carefnl calculations of the results of the cleaning np of tbe last system of undercurrents and tail sluices of tbe claims emptying into tbis river, and by some experiments at favorable points.

Let us snppose, bowever, tbat the general average of the tailings will reach 2½ cents per cubic yard, we have an aggregate of $1,100,000, to save wbich we mnst construct a tunnel of say 8,000 feet, lay it in flume, and place it in condition for running off tbe tailings. With the present facilities for running tnnnels, by means of compressed air, diamond drills, and giant powder, we should not estimat the expense per lineal foot at over $10 or $12—tbe rock being an easily worked slate—wbich would give an aggregate of $100,000. Allow $50,000 for putting in flume and incidental expenses, and we have a total cost of $150,000. Now, if 50 per cent. of the grose amount estimated to be in the river can be saved, we bave a result of $550,000, less tbe expense of cleaning up and original cost of tunnel. Tbe contents of these tailings bave been estimated hy Mr. Uren and others at much higber figures than above. After the tailings were run off, tbe tunnel would be valuable property as a tail-sluice outlet for many square miles of bydraulic ground. We have made tbe calculation out of cnriosity, but think this is one of the profitable mining enterprises of the future.

Another illustration of the extent of these accumulations is afforded at tbe crossing of Sbady Creek, near Cherokee, between the Middle and South Yubas. At this point tbere formerly stood a sawmill on tbe banks of tbe Creek; the hoilers of tbis mill were supplied by a watertank which stood bigher up on the bank of the stream. The tailings from above so encroached on the mill that it was rendered useless and taken down; the tank, however, remained, and the timhers of wbich it was composed are now seen cropping up ahove the tailings a distance of several inches. Another "rnn" will completely ohliterate all traces of this landmark of early times. The depth of tailings here cannot be less than 70 feet.

SALES.—Tbe Eureka *Sentinel*, says tbat the Tip Top mine has been sold to the Richmond Co. for $70,000 cash.

The Zapata mine at San Rafel, Lower Californiа, has been sold to San José Capitalists for $20,000. It is the intention of tho purehasers to erect a mill.

PLACER DIGGINGS have been struck on the road leading to Big Valley, Shasta Co., where dirt prospects 20 cents to the pan, of coarse gold.

Domestic Economy.

Food, and How to Use It.

Good cooking requires not only a certain amount of chemical knowledge, but also a considerable acquaintance with the chemistry of the stomach. The following article from "Good Words," is evidently the production of an expert, and will, no doubt, be appreciated by all intelligent readers:—"Potatoes, which are a dearer food than meat for the supply of flesh are far cheaper as a source of heat to the body, so with this view we associate them in our meals. Cheese gives us cheap flesh but dear fuel, so we take it with bread, which supplys the latter economically. Potatoes lay on flesh at an extravagant rate, so with potatoe soup we mix peas, which add to its nutritive value and to their economy. The making of palatable mixtures of various kinds of food forms the art of cookery. It is a maxim as old as Hippocrates, that "whatever pleases the palate nourishes," and it is only when taste becomes depraved by indulgence that the pleasure of eating becomes contemptible.

The Value of Lumps in Soup.

Many dishes of the cook are full of scientific significance. As an illustration let us ask, why are small square pieces of bread fried in lard, sent up with vegetable soup? Because starch requires to be mixed with saliva before it is converted into sugar in the act of digestion, and as the soup would pass to the stomach without mastication fried, or hard bread protected from the water by fat, so as to prevent its softening, is taken along with the soup, and compels mastication and a flow of saliva. But if cooks exhibit important scientific applications, they often err from ignorance of science.

Cooking Meats.

All the tasting ingredients of flesh reside in its juices and not in the solid substance. If the flesh of a deer, an ox, a pig, a cat, or a fox be well squeezed, so as to express their juices, what remains has the same vapid taste for all of them. For this reason roasted or stewed meat is generally better flavored than boiled, and the cook protect the juices by pouring melted fat over the joint during its roasting. In boiling meat for soup, cold water should be used at first, so as to extract as much of the nutritive juices as possible, and the heat be raised gradually. But if the meat be wanted in a boiled state for itself and not for its soup, then it should be plunged at once into boiling water, and kept boiling for a few minutes, so that all the outer albumen may be coagulated, in order to imprison the sapid and nutritive juices; then cold water should be added till the temperature is reduced to 160 degrees, at which it should be kept till the cooking is completed, because that heat is necessary for the coagulation of the coloring matter of the blood. In all cases, no more heat than is sufficient should be employed in cooking. Thus, in making soup, all the fire in the world will not make the water hotter than its boiling temperature, at which point it can be retained by a very moderate expenditure of fuel. Violent ebullition, such as we cooks often practice, while it does no good, does much harm, not only by wasting fuel, but also by carrying off in the steam much of the aromatic and volatile ingredients of the food.

Hard and Soft Water.

The effects of hard and soft water in cooking vegetables vary materially. Peas and beans cooked in hard water, containing lime or gypsum, will not boil tender, because these substances harden vegetable casein. In soft water they boil tender and lose a certain rank, raw taste which they retain in hard water. Many vegetables (as onions) boil nearly tasteless in soft water because all the flavor is dissolved out. The addition of salt often checks this (as in the case of onions) causing the vegetables to retain the peculiar flavoring principles, besides much nutritious matter which might be lost in soft water. Thus it appears that salt hardens the water to a degree. For extracting the juices of meat to make a broth or soup, soft water, unsalted and cold at first, is best, for it much more readily penetrates the tissues; but for boiling meat where the juices should be retained, hard water or soft water salt d is preferable, and the meat should be put in while it is boiling so as to seal up the pores at once.

Tea and Tea Mixes.

In choosing teas the first precept to be borne in mind is to suit the taste of customers. Different portions of the country prefer different varieties of tea, and even is this the case in different localities of the same section of country, according as the preponderance of the population is native or foreign born. Next to knowing exactly what is wanted is to discern the differences between the qualities of the samples. A good quality of tea will always feel to the touch firm, hard, crisp and weighty. Inferior qualities of tea are soft, spongy and bulky for their weight. A fine description of tea shows evidence of careful preparation. It is nicely rolled, delicately dried and when infused unrolls itself with freedom. New teas should show fresh and green from infusion. Old teas present a dark brown hue when infused, and the infusion a deep reddish color. The infusion should also be devoid of scum, which is evidence of an admixture of foreign substances. Evenness in size of leaf and absence of stalk is desirable for sake of style.

In mixing teas it is a well-known fact a change of character is effected as certain as is produced by chemical agencies by one body being brought into contact with another. Herein lies the success of the mixes. The following proportions constitute a good combination of teas to represent two varieties:

Oolong	5 lbs.	Oolong	5 lbs.
Japan	1½ lbs.	Japan	1 lb.
Young Hyson	1½ lbs.	English Breakfast	½ lb.
English Breakfast	1 lb.	Orange Peko	½ lb.

Of course it is not to be understood that the above proportions are never to be varied These are only given as an outline on which to base the judgment of the readers of this article. The same class of teas may not always be obtainable, yet it is still possible to keep up the standard of the mix the year round—a stock sample being always kept on hand to test by. Always remember the foundation. If the mix is too pungent, modify it by lessening those qualities which produce such a result, and *vice versa*. After being mixed, the product should be allowed to stand some days before being offered for sale. In bulk they improve, especially if kept warm and dry. After mixing, store in canisters as tight as are obtainable. Do not mix on a damp or rainy day. Keep the mix as far as possible from fruits, spices and coffees. A cargo of tea imported into London was once destroyed by a few boxes of oranges being stored in the hold. It had entirely lost its own flavor, so that when infused it merely showed color, while the infusion was flavored, as with orange peel.—*Am. Grocer.*

Food Values.

Dr. James C. Jackson, Principal of the "Home on the Hillside," at Danville, N. Y., publishes this:

With us, as a people, bread and meat constitute the staff of our life, being eminently the staples of our food. Of the grain used, wheat ranks all the other grains in quantity used, as it does all of them in natural fitness. According to Liebig, Bousingault, and other chemists, 107 parts of wheat are equal to 111 parts of rye, 117 of oats, 130 of barley, 138 of Indian corn, 177 of rice, 898 of potatoes, and 1,335 of turnips. In making bread out of wheat after the form or manner which with us is almost universal, certainly quite common, we greatly deteriorate it, insomuch as to make it less nutritious than it might be; but not only so, we make it noxious, thus disturbing those who eat in many instances, by causing severe irritation of their gastric nerves. In preparing wheat for cooking, the uniform practice is to separate the bran from the flour. When this is done, an analysis of these will show the barm of holting. The principal solid constituents of the human body are fat, bone and muscle. I offer the following condensation of facts taken from a statement of a scientific gentleman, correspondent of one of the ablest and oldest papers in the State of New York.

1. *The Fat.*—Of this ingredient, 1 000 lbs. of whole grain contributed 38 lbs.; fine flour, 20 lbs.; bran, 60 lbs.

So that the bran is much richer in furnishing the materials of fat than the interior portion of the grain, and the whole grain ground together is richer than the finer part of the flour, in proportion to nearly one-half.

2. *The Muscular Matter.* — One thousand pounds of whole grain, and of the fine flour, contain of muscular matter respectively—whole grain, 156 lbs.; fine flour, 130 lbs.

So that the material out of which the animal muscle is to be formed, the whole meal of wheat contains one-fifth more than the finest flour. For maintaining muscular strength, therefore, it must be more valuable in an equal proportion.

3. *Bone Material and Saline Matter.*—One thousand pounds of bran, whole-meal, and fine flour, contain respectively—bran, 700 lbs.; whole meal 170 lbs.; fine flour, 69 lbs.

So that in regard to that important part of our food necessary to all living animals, but especially to the young during their growth, the whole meal is three times more nourishing than the fine flour.

Taking the three essential elements of a nutritive food thus existing in wheat, and comparing their respective amounts in the whole-meal and in fine flour, we find that, on the whole, the former is one-half more valuable for fulfilling all the purposes of nutrition than the fine flour. "It will not be denied," says Professor Johnson, "that it is for a wise purpose that the Deity has so immediately associated in the grain the several substances which are necessary for the complete nutrition as animal bodies. The above considerations show how unwise we are in attempting to undo this natural collection of materials. To please the eye and the palate, to sift out a less generally nutritive food; and to make up for what we have recourse to animal food of various descriptions. It is interesting to remark, even in apparently small things, how all nature is full of compensating processes."

For a Meat Pie.—Cut up some pieces of good, tender raw beef or mutton, season with pepper, salt, and, if liked, one finely minced onion; boil a half dozen good-sized mealy potatoes, mash smooth and wet with milk enough to form a dough to make the crust; salt to please the taste, roll out full half an inch thick, and line a buttered dish large enough to hold the meat, lay in the meat, add a teacup of water, or less, if the pie is to be for a small family, then roll out a thick crust of the potato, covering the top of the pie at least an inch thick, and bake about an hour an a half.

Effect of a Continued Bread Diet.—According to late experiments of Mayer, neither man nor dogs can be fed economically upon bread alone, an immense quantity of this substance being required to prevent the body from undergoing waste. By the addition of a small percentage of flesh, a much less amount of total weight of food will answer the desired object. A persistence in the bread diet causes the tissues of the body to become more watery, and the entire organization is less capable of resisting injurious influences. In experimenting upon different kinds of bread, Mayer found that white bread was taken up in the greatest amount during its passage through the alimentary canal; next to this, leavened rye bread; then the rye prepared by the Horsferd process, and finally the North German black bread. With all these differences, however, the first kind is said to be less satisfying to the feeling of hunger than the other three, and to be more expensive in every point of view. Mayer does not admit that bran has the nutritious value claimed for it by many persons, since the nitrogeneous compounds it contains are mingled with much non-assimilable matter.

Etiquette at Table.—Table etiquette should be founded in common sense, though it is not always so. Certain articles of food cannot be thoroughly enjoyed if eaten with the use of a knife, fork or spoon. Hence good usage has sanctioned the use of fingers in certain cases. While our ideas of propriety would be shocked at seeing one take the bone of a beefsteak or mutton-chop in his fingers, we are not at all horrified when the little bones of a bird are treated in that way, since the meat can only be obtained easily and enjoyed thoroughly by picking them. It is much the same with green corn. Though gnawing the corn from the cob is not an elegant operation for an outside spectator to witness, it is very satisfactory to the individual most interested. Indeed, so generally is it conceded that corn may be eaten from the cob, that silversmiths now make silver handles which are to be thrust into the large end of the cob and allow it to be held without soiling the fingers.

Preserving the Flavor of Butter.—The German *Agriculturist* says that a great portion of the fine flavor of fresh butter is destroyed by the usual mode of washing, and he recommends a thorough kneading for the removal of the buttermilk, and a subsequent pressing in a linen cloth. Butter thus prepared, is pre-eminent for its sweetness of taste and flavor, qualities which are retained a long time. To improve manufactured butter, we are advised by the same authority to work it thoroughly with fresh cold milk, and then to wash it in clear water; and it is said that even old and rancid butter may be rendered palatable by washing it in water to which a few drops of a solution of chloride of lime have been added.

Destroying Mold in Cellars.—According to Dr. Weidehold, fungus growths in cellars may be combated either by burning sulphur or by pouring two parts of concentrated sulphuric acid over one part of common salt. In the first instance, sulphurous acid gas is produced; and in the second hydrochloric acid, by means of which the fungi are destroyed. It is sufficiently evident, however, that during this process all openings must be closed, so as to prevent any escape of the gas, and the greatest care exercised not to enter the cellar after the operation until it has been thoroughly ventilated.

To Keep Flies from Butter.—The Meridian *Gazette* is responsible for the following: "An experienced housekeeper tells a cotemporary that flies may be kept out of the butter plate on the table, by the simple and novel expedient of planting in it a thin slice of bread, cut column-wise and inserted in a perpendicular position. Whether the bread scares the flies off or not the lady cannot say, but she declares it certainly keeps them away."

Shaving Soap.—Take 4½ pounds white bar soap, one quart rain water, one gill beef's gall, and one gill spirits turpentine. Cut the soap thin and boil five minutes. Stir while boiling, and color with half ounce vermillion; scent with oil of rose or almond. Fifty cents worth of materials will make $6 worth of soap.

Keeping Sausage Meat.—Cook fresh sausage as for the table without flouring it; then put it in thin layers in a sweet earthen or stone pot with gravy from running hot lard over each layer. It will be as good as when first made.

To Remove Tan, Freckles, Pimples, Etc. To two gallons strong soap suds add one pint pure alcohol, and four ounces rosemary; mix them well together. Apply with a linen rag twice a day, until the object is effected.

Old Ships.—There is a ship now sailing from Holland, built in 1598, when the Prince of Orange was fighting Philip II., of Spain, then at the zenith of his power. A few weeks since, in the Boston *Daily Advertiser*, there was a notice that the whale-ship Ronssean (one of Stephen Girard's ships, built at Philadelphia in 1801) was then undergoing repairs at New Bedford. Her planking is being removed, the first time for seventy years. The live oak timbers underneath are reported to be as sound as they were the day they were first put together.

PACIFIC STONE COMPANY.

Ransome's Patents International,

For which Commissioners for the Exhibition of 1862 awarded the Prize Medal, and Gold Medal at the Mechanics' Institute Fair, 1871, of San Francisco.

REMOVAL.

This Company have removed from the corner of Turk and Larkin streets, to their new and Commodious works corner of Greenwich and Octavia. They have established an office and salesyard at the Junction of Market and Bush, where they will keep constantly on hand an assortment of ORNAMENTAL, BUILDING, CEMETERY and GRINDSTONES. Orders will be received at the above office from all who wish to get good work at low prices. Send for Circular. 5v24-3amslamrly

Dupont's Gunpowder, Safety Fuse,

—AND—

WINCHESTER REPEATING ARMS.

DUPONT'S Superior Mining Powder (saltpetre), F-FF-FFF.

DUPONT'S Blasting Powder, in air-tight corrugated Iron Kegs, C-F-FF-FFF.

DUPONT'S Celebrated Brand, Diamond Grain, Nos. 1, 2, 3 and 4, in 1 lb. and ½ lb. canisters.

DUPONT'S Unrivalled Brands, Eagle Duck and Eagle Rifle, Nos. 1, 2, 3, in half kegs, qr. kegs, 5 lb. tins, and in 1 lb. and ½ lb. canisters.

DUPONT'S Standard Rifle, Fg-FFg-FFFg, in kegs, half kegs and qr. kegs, and in 1 lb., ½ lb., and ¼ lb. canisters.

DUPONT'S Superior Rifle, A. F. & Co., F-FF-FFF, in kegs, half kegs, qr. kegs, and in 1 lb., ½ lb. and ¼ lb. canisters.

DUPONT'S Cannon, Musket, Meal and Fuse Powder.

EAGLE SAFETY FUSE (manufactured near Santa Cruz, Cal., by the L. S. & P. Co.) Constantly on hand full supplies of their Celebrated Brands, Waterproof and Submarine, Triple Taped, Double Taped, Single Taped and Hemp Fuse. Fuse made especially to explode the Giant Powder and Hercules Powder Caps.

The above named Fuse are warranted equal to any made in the world.

WINCHESTER REPEATING ARMS (Henry's Improved) and **FIXED AMMUNITION.**

A large and complete stock of these celebrated arms constantly on hand, to wit:

Repeating Sporting Rifles—Oiled Stocks.

Repeating Sporting Rifles—Varnished Stocks.

Gold, Silver and Nickle-plated Rifles—beautifully Engraved.

Repeating Carbines—Oiled Stocks.

Repeating Carbines—Gold, Silver and Nickel-Plated and Engraved.

Muskets—Angular or Sword Bayonets.

Full stock constantly on hand of all the different parts of the Winchester Arms.

Cartridges in cases (Brand H), manufactured by the W. R. A. Co. expressly for their arms.

A full and complete stock of the above named merchandise always on hand and for sale by

JOHN SKINKER, Sole Agent,

The California Powder Works

No. 314 CALIFORNIA STREET,

SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,

MINING,

And BLASTING

POWDER,

Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.

We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

HERCULES POWDER,

Which combines all the force of other strong explosive now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other pompound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office.

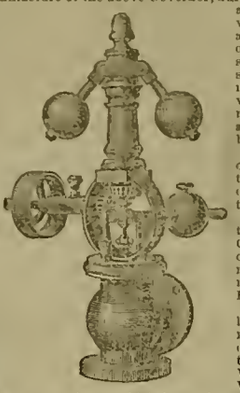
THE GARDNER AUTOMATIC SAFETY-STOP GOVERNOR.

These Governors have now been sold in this market for several years, and wherever once introduced and made known, are invariably sought after. They are in the Eastern States fast displacing all other Steam Governors, and are regarded as *the perfect regulator*. They are manufactured by Messrs. Gorchur & Robertson, practical engineers, who have given many years time exclusively to their manufacture and perfection. The manufacturers say: After an experience of eleven years in the manufacture of the above Governor, during which time several important improvements have been made and two additional patents obtained, we feel justified in recommending it to all parties using Steam power, and warranting it to be the most perfect regulator in the market.



The Gardner Governor is so well known that we think it unnecessary to enter into a detailed explanation of the principles involved, or details in its construction, merely giving the leading objects realized by this important invention. The Governor combines with the greatest simplicity of construction, accurate regulation of speed, POSITIVE INSURANCE AGAINST ALL ACCIDENTS LIABLE TO OCCUR FROM SLIPPING OR PARTING THE GOVERNOR OR DRIVING BELTS, and a convenient arrangement for ADJUSTING THE SPEED OF THE ENGINE WHILE IN MOTION, without change of pullies.

The construction of the Governor is extremely simple, having no springs, inside joints, swivels, or parts liable to disarrangement, all the several parts are duplicates of each other in the same series; the most skillful workmen are employed, the best material used and the machinery employed especially adapted to their manufacture. The valve is most PERFECTLY BALANCED, and the Governor is built with a view of securing the quickest and most sensitive action possibly attainable in a steam regulator. Thus with accurate machinery, and skilled labor, and devoting our WHOLE ATTENTION to the manufacture of THIS ONE ARTICLE, we are able to produce a perfect and reliable Governor at a low price.

We do not publish any letters of recommendations, but can give references to upwards of 5,000 PARTIES THROUGHOUT THE UNITED STATES, who are using the Gardner Governor.

We would especially invite the attention of steam Engine Builders to this Governor, feeling assured that they can purchase for less than they can make an inferior article, and thereby increase the value and sales of their Engines.

We respectfully refer to the following parties using the GARDNER GOVERNOR, and can speak understandingly of its merits: Oakland Cotton Mills, the Selby Lead and Silver Smelting Works, L. & E. Emanuel, Vulcan Iron Works, Fulton Foundry, Levison Bros., Cal. Jewelry Co., Pioneer Woolen Factory, D. A. McDonald & Co., and others in San Francisco; Ophir Co., Lady Bryan, and Sacramento and Meredith Mills, John McCode, Virginia, Nev.; Globe Iron Works, Stockton; A. F. Chury, Albany, Oregon, and many others.

☞WE WARRANT these Governors to give perfect regulation of speed under all circumstances; and if there is one within one thousand miles of San Francisco, that is not giving perfect satisfaction, it may be returned to us at our expense, and we will exchange it for any other Governor in the country, or refund its price.

☞When ordering please state whether THROTTLE-VALVE is wanted or not; and whether BLOCK or FINISHED Governor is desired. **THE RATE OF SPEED FOR GOVERNOR IS FULLY STAMPED ON THE REVOLVING HEAD OF EVERY GOVERNOR. Send for circular and price list to

TREADWELL & CO.,

Agents for Pacific States, San Francisco.

☞At Treadwell & Co.'s (late BERRY & PLACE'S) Machinery and Supply Depot may be found in stock the above Governors, together with all sizes of HOADLEY'S PORTABLE ENGINES, BLAKE'S STEAM PUMPS, STURTEVANT BLOWERS, PORTABLE DRILLS, TAPS AND DIES, DREYFUS'S CYLINDER LUBRICATORS, Etc. Also a heavy stock of HARDWARE AND MINING TOOLS, LEATHER BELTING, LINEN HOSE, BOILER FELT (saves 25 per cent. of fuel), SELF-OILERS, LACE LEATHER, STEAM PACKING (all kinds), BELT STUDS, Etc., Etc., embracing every description of Engineers' and Machinists' supplies and Millmen's findings. 7v24-tf

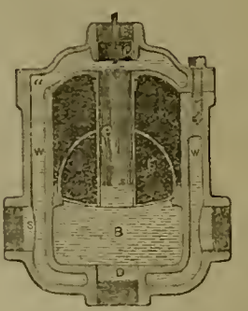
1v24-6m J. DICKINSON, 64 Nassau St., N. Y.

CRAIG & BREVOORT'S
Patent Condenser for Steam
PUMPS, &c.



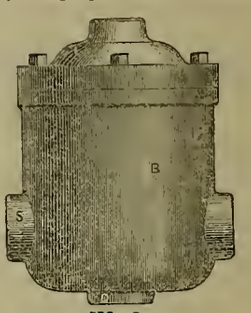
NO. 1.

The annexed engravings represent a Condenser intended to be attached to the ordinary steam pump, thereby bringing it within the class of low pressure, or more properly speaking, of condensing engines; the steam, when it has done its work in the cylinder, instead of being exhausted into the atmosphere, is conducted to the condenser, on its entry into which, it meets the water drawn by the pump, and is immediately condensed.

The Cut No. 1 represents a vertical section of the Condenser, and No. 2 an elevation.

The flange D is bolted to the suction orifice of the pump, and the flange S to the pipe leading to the well, or whatever source of supply the pump may have; W is a water jacket surrounding the main chamber of the condenser, B, and with which the suction pipe, S, communicates, permitting a free circulation of water within the jacket and into the hollow cover or top through the series of openings, one of which is shown at A, and from thence into the body of Condenser, B, through pipe P, carried by float F; the pipe P also acts automatically as a valve to enlarge or contract the space through which the water enters it, by which means the possibility of the condenser being at any time flooded is avoided. The pipe P, it will be observed, also acts as guide to float F.

The valve, C, (shown in Cut No. 1), which is raised or lowered by means of screwed stem—shown coming through elbow in Cut No. 2—is for the purpose of increasing or decreasing the flow of water according to the capacity of the pump to which it is attached.



NO. 2.

The exhaust pipe from steam cylinder is screwed into cover at E; the exhaust steam is thus thrown directly into contact with the water entering the condenser on its way to water cylinder of pump through D. A vacuum being of course immediately formed, acts on the exhaust side of the steam piston, aiding it in its work. If at any time it is desirable to run the pump without the condenser, it is only necessary to turn the three-way cock, which is placed in the exhaust pipe, into such a position as to cause the steam cylinder to exhaust into the atmosphere; when this is done the pump is perfectly free from the condenser, and acts as if it were not attached. This condenser is specially useful for pumps running in mines, or any other position where trouble is experienced in getting rid of the exhaust steam. Address H. L. BREVOORT,
6v23eowly 128 Broadway, New York City.

Alkali Soils.

Many of our mountain readers will be interested in the following discussion which recently took place at the Sacramento Farmers' Club, on the reclamation and value of alkali soil:

J. R. Johnson said—I think it evident that drainage alone cannot always be made effectual in the reclamation of alkali soile; at least other expedients may be resorted to in connection with drainage with good results. Stable manure, well mixed with the soil, and turning the soil up with the plow and allowing it to remain loose, expoeed to the action of the sun and atmosphere will help much. Alkali soils generally are very rich with the elements of production, but these elements are so mixed with other ingredients that plants cannot separate and use them. Anything that will neutralize or counteract these vicious ingredients will reclaim the soil and render it valuable. Manures of various kinds are found to do this, particularly coarse manures, as straw. The great difficulty with alkali soils is that they pack too close together, so as to exclude the air and heat. Mixing with coarse manures opens the pores, so to speak, and enables the soil to breathe, and thus change its nature.

Hoyt—I think the base of alkali soils is salt; and anything that will extract the salt will reclaim the land and make it productive. I agree with Johnson, that the alkali soils have a superabundance of elements of production, but not in proper proportion; restore the proportion and these lands are very valuable. Indeed, much of our alkali soil would make good manaure for a large portion of the light eoils of the Atlantic States.

Aiken—I repeat, the great and effective agent at our command at the least expense for the reclamation of alkali soils ié drainage. Carry off the surplue water, and with it you will carry off the surplus alkali and render the soil porous and lively and productive.

Coffee Growing in California.—A correspondent who has had experience in the cultivation of coffee in Java, at an elevation of 4,000 feet above the sea, where the banana would not bear fruit, and the sugar cane would not grow, and where the climate is colder than on our southern coast, writes to us that he is confident a coffee plantation of 300 acres, well managed, would pay well in California. He would send to the mountains of Java for the plants, at a cost of $2,000, set out 4,200 on an acre, in timber land, so that the trees would shade the young plauts, cultivate them three years at an expense of $35,000, and in the third year harvest a full crop of 5,000 pounds per acre, worth for the entire plantation, $300,000 or $400,000. He says that in Java, where the Government, which owns most of the coffee plantations, has allowed private individuals to go into the business, they have made extraordinary profits. The subject deserves attention, though our correspondent may be too sanguine. The prudent course would be to cultivate a few plants, and find out how they prosper. We believe there are some in the State now.—*Alta.*

The foothills of the Sierras in Placer, El Dorado, and Amador counties, are green with thousands of acres of the best looking wheat in the State, whilst a great deal in the lower valleys is too rank for the season and will require to be pastured or mown off.

Smelting in Pittsburgh.

Among the industrial enterprises of Pittshurgh, the smelting of silver ores promieee to be an important occupation. A furnace has already been erected and is now running successfully, and in all probability it will serve as the nucleus of one or more extensive smelting works, where ores of the precious metals may be cheaply reduced. Large quantities of ores from Utah and other weetern Territories are forwarded in sacks by the Union Pacific railroad and ite connections to New York, whence it is shipped to Swansea, in Wales, passing directly through Pittsburgh on its way. The expeuses of transportatiou over this long route are very heavy, while the cost of smelting in Utah, owing to various causes, is muoh greater than it would be in a city so favorably situated as Pittsburgh, where fuel of the best quality exists in abundance. The experiments hitherto made prove that the silver ores from the Flagstaff, Crœsus, and other characteietic minee may be smelted at a cost not exceeding five dollars per ton, while the transportation charges are much less than would he the expense of smelting at the mines. As these experimente are heing conducted by experienced persons, and have already progressed favorahly, they may lead to the establishment of permanent works, and tend to keep the profits of emelting ores at home, instead of sending them to foreign metallurgists.—*Am. Engineer and Review.*

Co-operative Housekeeping. — Self-made men revert with pardonable pride to the difficulties which they overcome in early years. One supported his mother and sisters aud self, and paid the expenses of a college education, by hard manual labor. Another made his original mark in some New England district school, living frugally and studying hard. In fact, the devices resorted to a few years ago, by poor but ambitious young meu, who poseesed plnck and independence, are a legion in number. No one feele disposed to dispute these facts, but when it is hinted that the material for self-made men is exhausted, and that the boye of to-day never feel the Promethean fire burning in their bosoms, then it becomes necessary to advance some argument to the contrary. There are ten young men from Healdeburg attending the State University. Some of theee etudents could not afford to go through the College course, if they had to board at a hotel or in a private family. In view of this circumstance, the ten young men have formed a club and board themselves, having a Chinese cook. The expense ie thus reduced to fifteen dollare per month, and this includee board and washing. Thue, the tuition being free, the stndents can beoome thoroughly educated at a trifling cost, and it is evident that the young Californians appreciate this fact, and are determined to enjoy the generosity of this State.

Col. Black's Portrait, as recently published in the Press is alluded to by the *New North West*, of Deer Creek, M. T., as follows: Now we are not acquainted with Col. Black—have never seen him, to our knowledge—but the illustration (although, of course, not a fine steel engraving), is certainly well executed, and up to the average of common wood engraving; and as for looks, if the Colonel is any better looking than that, he must without a doubt be the handsomest man in the Territory. The picture is decidedly *good looking* (as any one can see by examining it), even as it now is, and it is very likely it falls short of the original in fine personal appearance; but we have not seen a handsomer face (amoug men) in Montana than this same picture indicates. The editor of the *Gazette* must be a little jealous; certainly nothing else could ever induce him to attempt the demolition of so fine a likeness.

The discovery of glass making was effected by seeing the sand vitrified upon which a fire had been kindled. Blancourt says that the making of plate glass was suggested by the fact of a workman happening to break a crueihle filled with melted glass. Theﬂ uid ran under one of the large flag-stones with which the floor was paved. On raising the stone to recover the glase, it was found in the form of a plate, snch as could not be produced by the ordinary process of blowiug.

The drainage of wet lands adds to their value by making them produce more and better crops, by producing them earlier, thus giving more time to mature.

Miners, mechanics, write for your paper.

Summary of Meteorological Observations in Montana.

Made at Deer Lodge City, M. T., by Grauville Stuart, during seven months of the year 1871. Latitude, 46° 26′; Longitude, 112° 40′; Altitude, 4,768 feet.

Observations.	June.	July	Aug.	Sept	Oct.	Nov.	Dec.

Following is the amount of snowfall in Deer Lodge:

20.25 inches in 1867-8.	Greatest depth at any time..	2½ in.	
16.75 "	1868-9.	"	" 2 "
29.35 "	1869-70.	"	" 4 "
45.73 "	1870-71.	"	" 3 "
70.42 "	1871-72. (To Feb. 22).....		12 "

Average amount of rain and melted snow in Montana, for four years..... 12 "

Greater portion of Deer Lodge Valley bare of snow at date (Feb. 22d). Stock doing well; but few head have died as yet, and spring seeme at hand. This has been a severe winter in Montana. Considerable loss in Texas cattlo in some localities, as they were driven in late in the fall and were thin in fleah. They could not stand the enow and unusual cold, coming as they did from a warm climate. Native cattle generally have done well. We are sure of an abundance of water this year, and the oonsequent yield of our placer mines will be very great. The mining season is expected to open ahont the 1st of April.

Granville Stuart.

Deer Lodge City, M. T., Feb. 22, 1872.

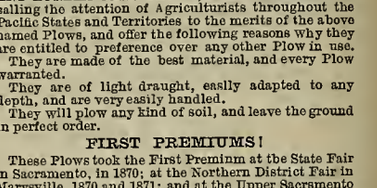
HILL'S PATENT
EUREKA GANG PLOW,



The undersigned, Manufacturers of "HILL'S PATENT EUREKA GANG PLOWS," take this method of calling the attention of Agriculturists throughout the Pacific States and Territories to the merits of the above named Plows, and offer the following reasons why they are entitled to preference over any other Plow in use.

They are made of the best material, and every Plow warranted.

They are of light draught, easily adapted to any depth, and are very easily handled.

They will plow any kind of soil, and leave the ground in perfect order.

FIRST PREMIUMS!

These Plows took the First Premium at the State Fair in Sacramento, in 1870; at the Northern District Fair in Marysville, 1870 and 1871; and at the Upper Sacramento Valley Fair, Chico, 1870 and 1871. At the Mechanics' Fair, held in San Francisco in 1871, a Silver Medal was awarded these Plows; and the State Agricultural Society, at the last Fair, offered a premium of $40 for the best Gang Plow. The committee was composed of practical farmers from the agricultural counties, who, after a fair test and thorough competition with the leading plowe of the State, awarded the premium to the Eureka Gang Plow. From this it will be seen that these celebrated plows still maintain their reputation over all competitors. Patented Sept. 7, 1869.

Champion Deep-Tilling Stubble Plow,

which took the First Premium over all competitors at the State Fair, 1871. It turns a furrow 14 inches deep and 24 inches wide.

This Gang Plow combines durability with cheapness, being made entirely of iron by experienced workmen, of the best material. Over three hundred are now in use, and all have given entire satisfaction.

Manufactured and for sale at the corner of Third street and Virgin Alley, Marysville, by

HILL & KNAUGH,

And also by most leading Agricultural Dealers in the State. All others are invited to apply at once for Circulars, prices, etc, 16v23-tf

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the Scientific Press we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Marcelina Silver Mining Company.—Location of Works: Eureka District, Lander County, Nevada.

Notice is hereby given that at a meeting of the Board of Trustees of said company held on the eighth day of March, 1872, an assessment of ten cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, Room 21, Hayward's Building, 419 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the fifteenth day of April, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the seventh day of May, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

CHAS. E. ELLIOTT, Secretary.

Office, Room 21, Hayward's Building, 419 California street, San Francisco, California. mar19-3w

Nuestra Senora de Guadelupe Silver Mining Company.—Location of Works: Tayoltita, San Dimas District, Durango, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twelfth day of May, 1869, an assessment of two dollars per share was levied upon the assessable capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, E. J. Pfeiffer, No. 210 Post street, or to the Treasurer, A. Himmelmann, No. 637 Washington street, San Francisco, to settle the indebtedness of the said Company.

And whereas there has been an error in the course of proceedings for the collection of said Assessment, by reason of which, as provided by law, all previous proceedings, except the levying of the Assessment, are void, and publication required to be begun anew. NOW, therefore, by order of the Board of Trustees of said Company, at a meeting of said Trustees, held on the eighth day of March, 1872, said Assessment is hereby re-published, and notice thereof given as follows, to wit;

Nuestra Senora de Guadelupe Silver Mining Company.—Location of Works: Tayoltita, San Dimas District, Durango, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twelfth day of May, 1868, an assessment of two dollars per share was levied upon the assessable capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, E. J. Pfeiffer, No. 210 Post street, or to the Treasurer, A. Himmelmann, No. 637 Washington street, San Francisco, to settle the indebtedness of the said Company.

Any stock upon which said assessment shall remain unpaid on the fifteenth day of April, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the eighth day of May, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

E. J. PFEIFFER, Secretary.

Office, No. 210 Post street, San Francisco, California.

Ophir Copper, Silver and Gold M. Company—Location of Works, Ophir, Placer County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 18th day of March, 1872, an assessment of twenty (20) cents per share was levied upon the capital stock of said Company, payable imuediately, in United States gold and silver coin, to the Secretary, N. E Cor. Sansome and Halleck Sts., entrance on Halleck, street, San Francisco. Any stock upon which said assessment shall remain unpaid on the 20th day of April, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 17th day of May, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees. R. G. BRUSH, Secretary.

Office, N. E. Corner Sansome and Halleck Streets, S. F.

Pocahontas Gold Mining Company—Location of works, Mud Springs, El Dorado County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 26th day of February, 1872, an assessment of Five Dollars per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the office of the company, Room No. 26, Hayward's Building, No. 419 California street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on Saturday, the 6th day of April, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before will be sold on Monday, the 6th day of May, 1872, to pay the delinquent assessment thereon, together with costs of advertising and expenses of the sale.

D. A. JENNINGS, Secretary.

Office, Room No. 26, Hayward's Building, 419 California street, San Francisco, Cal.

February 26, 1872. mar2-5w

Quail Hill Mining and Water Company—Location of works: Calaveras County, California.

NOTICE.—There are delinquent upon the following described stock, on amount of assessment levied on the 15th day of February, 1872, the several amounts set opposite the names of the respective shareholder as follows.

Names.	No. Certificate.	No. Shares.	Am't.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Opsratss as Follows:

The pan heing filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly pasaing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco.

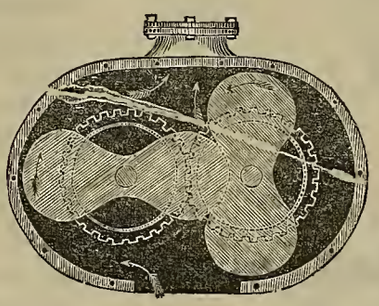
ROOT'S PATENT FORCE BLAST ROTARY BLOWER,

MANUFACTURED AT

The Globe Iron Works, Stockton, Cal.

AWARDED THE FIRST PREMIUM AT THE PARIS EXPOSITION—PATENTED NOV. 1, 1864; JULY 24, 1866; AND OCT. 9, 1866.

Adapted FOR Smelting, Foundry, Mining and Steamships.



Requires **50 Per Cent.** LESS POWER Than any Blower Now in Use.

One of these Blowers may be seen at W. T. Garratt & Co.'s Brass Foundry, San Francisco; Gould & Curry and Savage S. M. Co.'s, Nevada; and at C. P. R. R. Co.'s Works, Sacramento; and other places on this coast.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

QUARTZ, SAW AND GRIST MILL, IRON, STATIONARY AND STEAMBOAT ENGINES, HORSE-POWER AND PUMPS, OF ALL SIZES.

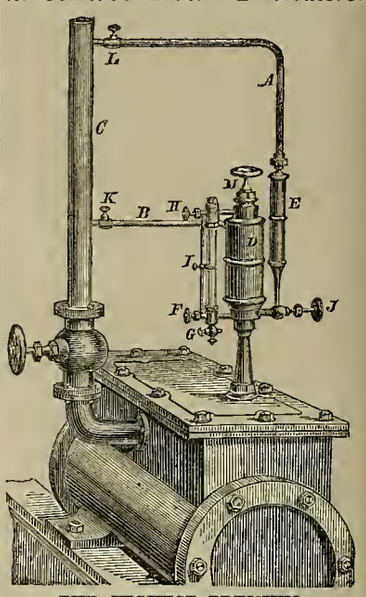
Machinery.

N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; L, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

BLAKE'S PATENT STEAM PUMP.

From the Report of the Committee on Steam Pumps, at the Seventh Industrial Exhibition of the Mechanics' Institute, San Francisco:

BLAKE'S STEAM PUMP.—This Pump yielded the best results as to the quantity of water discharged as compared with its measured capacity. The valves are of brass, and well arranged. The steam valves are well arranged for operating the pumps, either fast or slow.

We recommend that a Medal be awarded to it, as THE BEST STEAM PUMP. [Awarded a SILVER MEDAL, the first premium.] (Signed) JAS. SPIERS,
WM. H. BIRCH.

From the Report of the Committee on Steam Pumps, at the Eighth (or *last*) Industrial Exhibition of the Mechanics' Institute, San Francisco:

BLAKE'S MINING PUMP.—This is an excellent Pump, well made, and gives a high per cent. of duty. We recommend a Diploma for this Pump. (Signed by the Committee.)

G. W. DICKIE, H. B. ANGEL, CHAS. R. STEIGER,
W. EPPELSHEIMER, MELLVILLE ATWOOD.

[No other Steam Pump received other than a Diploma or honorable mention at the LAST Mechanics' Exhibition, *all other assertions to the contrary notwithstanding.* Hooker's Hand Pump was the *only* Pump, of any kind whatsoever, that received a MEDAL and FIRST PREMIUM (highest award to pumps) at the *last* Exhibition, for which we are also selling agents.—*See official Report of the above Committee.*]

The trial of Steam Pumps at the Eighth Industrial Fair in San Francisco, by a committee of five of the most thoroughly practical mechanics on this coast (as above named), showed that the Blake Pump gave 86 per cent. of utilized power, while others gave but 60 per cent., showing great difference in economy.

The Blake Pump is the ONLY *Steam Pump that* EVER RECEIVED A SILVER MEDAL *at any Exhibition of the Mechanics' Institute ever held in San Francisco or California.*

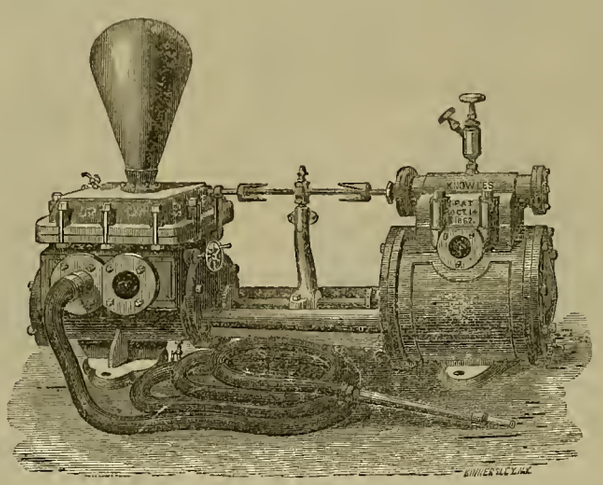
☞ A complete stock of all sizes constantly on hand at the Machinery Warehouse of the Agents,

12v3-awhp **TREADWELL & CO.,**
Market street, corner of Fremont, SAN FRANCISCO.

KNOWLES' PATENT STEAM PUMP.

Received the Highest Award---A Diploma---

Over all Steam Pump Competitors, at Mechanics' Institute Fair of San Francisco, 1871; also Special Medal and Diploma at State Fair.



It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.

The trial of Steam Pumps at the Eighth Industrial Fair in San Francisco, by a Committee of Five of the most thoroughly practical mechanics on this coast, showed the Knowles Pump to lose but 11½ per cent., while others lost as high as 40 per cent., showing great difference in economy.

CENTRAL PACIFIC R. R., OFFICE OF THE GEN'L MASTER MECHANIC,
SACRAMENTO, Cal., April 14, 1871.

A. L. FISH, Esq., Agent of the Knowles' Steam Pump, San Francisco—Dear Sir: In reply to your inquiry as to the merits of the Knowles' Steam Pump, in use upon this road, I will say that we have nineteen of them in use on this road as fire engines, and pumping water for shop and station use. I consider the Knowles Steam Pump the best in use, and prefer it to any other. Yours truly, A. J. STEVENS, General Master Mechanic.

WE BUILD AND HAVE CONSTANTLY ON HAND

THE LARGEST STOCK OF PUMPS IN THE WORLD,

And for Every Conceivable Purpose.

A. L. FISH, Agent.

No 9 First Street, San Francisco, Cal.

P. S.—All kinds of new and second-hand Machines on hand. 3v24-eow-bp

24v23-tf JOHN TAYLOR & CO.

The Scientific Press is the Oldest and Largest Practical Mining Journal in America.

Established in 1860, this weekly has steadily advanced in size, ability and interest. Its chief editors and publishers have had over fifteen years successful experience in conducting this and other journals in California.

Its editorials are carefully prepared with an honesty and accuracy that maintains its reputation as the best authority on mining matters in the country.

It is published in the best location in the world for furnishing the largest amount of valuable information to the gold and silver miners and metallurgists everywhere.

Its correspondents and subscribers are to be found in nearly all the mining districts of CALIFORNIA, NEVADA, IDAHO, MONTANA, UTAH, ARIZONA, COLORADO, and in MEXICO and other foreign countries.

Over 10,000,000 Dollars!

Have doubtless been saved to the miners of the Pacific Coast by reading this journal, each issue of which contains some two pages of MINING SUMMARY from the most important districts in the U. S.; from one to two pages concerning NEW INCORPORATIONS, SHARE MARKET, MINING CORRESPONDENCE, COMMUNICATIONS, etc., and from two to three pages of EDITORIALS (with illustrations) of NEW MACHINERY, NEW DISCOVERIES, PROCESSES, and operations in MINING, MILLING, ROASTING of ORES, ASSAYING, etc.

One feature of our journal consists in presenting in each issue a POPULAR VARIETY of highly interesting matter, useful and instructive for all intelligent readers, systematically arranged in departments under headings entitled Mechanical Progress; Scientific Progress; Mechanical Hints; Home Industry; New Discoveries; Good Health; Domestic Economy, etc., rendering its reading pleasant and profitable at the OFFICE, SHOP AND FIRESIDE.

Yearly subscription $4 per annum. Single copies 10 cents.. Four sample copies (of recent dates) furnished for 25 cents. List of California mining books sent free. DEWEY & CO., Publishers, Patent Agents and Engravers, No. 338 Montgomery street, San Francisco.

DEWEY & CO.,

SCIENTIFIC PRESS

U. S. AND FOREIGN

PATENT AGENCY.

The principal Agency on this side of the continent. Established in 1860. Inventors can rely upon the surety and dispatch of all important and confidential business intrusted in our hands. Long familiarity with Mining, Farming, and all other classes of inventions on this coast, enables us to give the most intelligent advice to PACIFIC COAST INVENTORS of any Agency in the Union, and oftentimes save unnecessary delay and expense. Every branch of the patent soliciting business attended to. All WORTHY INVENTIONS patented by us will be liberally noticed, free, at the most desirable time for the patentee, in both the SCIENTIFIC PRESS and the PACIFIC RURAL PRESS.

Send for our 52-page illustrated PATENT CIRCULAR, mailed free on receipt of stamp. Also the U. S. Patent Law of 1870.

DEWEY & CO.,

No. 338 Montgomery st., S. E. cor. California st., diagonally across from Wells, Fargo & Co., S. F.

COMPLETE VOLUMES

Of the SCIENTIFIC PRESS can be had from January 1, 1864, to date, at $3 per single vol. or $6 a year. They afford the cheapest and best information on mining and the industry of this coast of any work published.

Hemp, Soapstone and Rubber **Steam Packing**

THE GARDNER GOVERNORS, STEAM AND WATER Gauges, Tube Scrapers, Cylinder Cups and Self-Oilers, Boiler Felt, Leather Belting, Lace Leather, Linen and Rubber Hose, Belt Hooks and Studs, Sheet Packing, and a general stock of Engineers' and Mill Supplies, at the Machinery and Supply Depot of TREADWELL & CO., old stand, corner Market and Fremont streets, San Francisco. 13v24-eow

THE GIANT POWDER COMPANY

Are now manufacturing besides the famous regular

GIANT POWDER, A NO. 2 GIANT POWDER,

Somewhat slower in its Explosion, which we recommend for

BANK BLASTING, COAL MINES,

AND FOR ALL SUCH WORK WHERE THE ROCK IS NOT VERY HARD

It is fully as safe as the other and evolves neither smoke nor noxious fumes when exploded.

Price. 50 Cents per Pound.

The sales of both grades increase very fast, which is the best proof of their superiority over other explosives.

From San Jose Patentees.

SAN JOSE, March 15, 1872—Messrs. DEWEY & Co.—Gentlemen:—Accept our thanks for the prompt and able manner in which you have obtained our letters patent on Animal Trap. Believing you to be gentlemen that can be relied upon as Patent Solicitors, we remain, yours respectfully, COOMBE & PHELPS.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., SCIENTIFIC PRESS Office, S. F.

BY CUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price $2.50 coin, or $3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. Price, $7.50, postage paid.,

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, $5 in cloth; $6 in leather—coin.

BY OTHER AUTHORS.

The Explorers', Miners' and Metallurgists' Companion; Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy. The Most Practical and Comprehensive Work on Mining Subjects Extant. Comprising 640 Pages and 81 Engravings. By J. S. Phillips, M. E. Price, bound in cloth, $10 (in coin or its equivalent). In leather, $12. Postage, 50 cents extra. Issued and for sale by DEWEY & CO., Patent Agents and Publishers Scientific Press, S. F.

The Quartz Operator's Hand-Book; by P. M. Randall. Revised and Enlarged Edition. Cloth bound, 175 pages. Price, $2.

SCIENTIFIC PRESS.

AN ILLUSTRATED JOURNAL OF SCIENTIFIC AND INDUSTRIAL PROGRESS,

Mining, Mechanic Arts and Inventions.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, APRIL 6, 1872.

VOLUME XXIV. Number 14.

Important to Mine and Ditch Owners.

We took occasion a short time since to refer to Mr. Sargent's efforts in Congress in behalf of the mining interests of this Coast, in regard to the "Mineral Land Bill." Although not as successful as he expected, he has nevertheless secured an important concession, which will save the expense and trouble occasioned by the necessity of claimants of mining ground going to Sacramento with their witnesses to prove that it is such. Regulations are now in course of preparation, and will shortly be issued, permiting local officers—County Clerks—in respective localities near the mines in question, to take affidavits, to prove possession, expenditure, boundaries, etc., in making out applications for patents. This does away with expensive journeys to the land offices and makes the business much more simple and convenient.

Mr. Sargent has also succeeded in changing the phraseology of land patents, and, for the protection of ditch owners, a clause will hereafter be inserted in all such patents expressly reserving their rights to the undisturbed use of their property. The law which grants right of way to ditch companies recognizes the rights of the property holders but does not secure them patents for the meandering lines of land traversed, which on the other hand may be covered by patents obtainable by other persons, who have it in their power, thereby, to blackmail or embarrass ditch owners in many ways. It has not been fully decided yet whether the right of way granted by the Act of 1866 is a perpetual right, or merely a temporary one which the Government can revoke by subsequent patent to other parties. This is a very important measure for ditch owners and will be very gratifying to them. After the insertion of this clause in land patents reserving a certain portion which is to be vested in the ditch owners, their rights will be much better protected and their will be no chance for blackmailing operations.

The Secretary of the Interior recently made a decision of great importance to the mining interests of this Coast. It is to the effect that all adverse claims in mineral cases under the Act of July 26, 1866, must be filed within the 90 days' notice required by said Act to be given, and that parties have not the right to file adverse claims up to the date of the approval of the survey.

The Legislature has refused to pass the bill requesting Congress to change the laws requiring that only citizens of the United States can obtain patents and titles to mining lands, and to abolish or modify the clause requiring that $1,000 be expended before a patent can be issued.

Fire.—A disastrous fire occurred in Monitor, Alpine county, on the 31st ult., by which a whole block of buildings was consumed.

Brown's Patent Stop Valves.

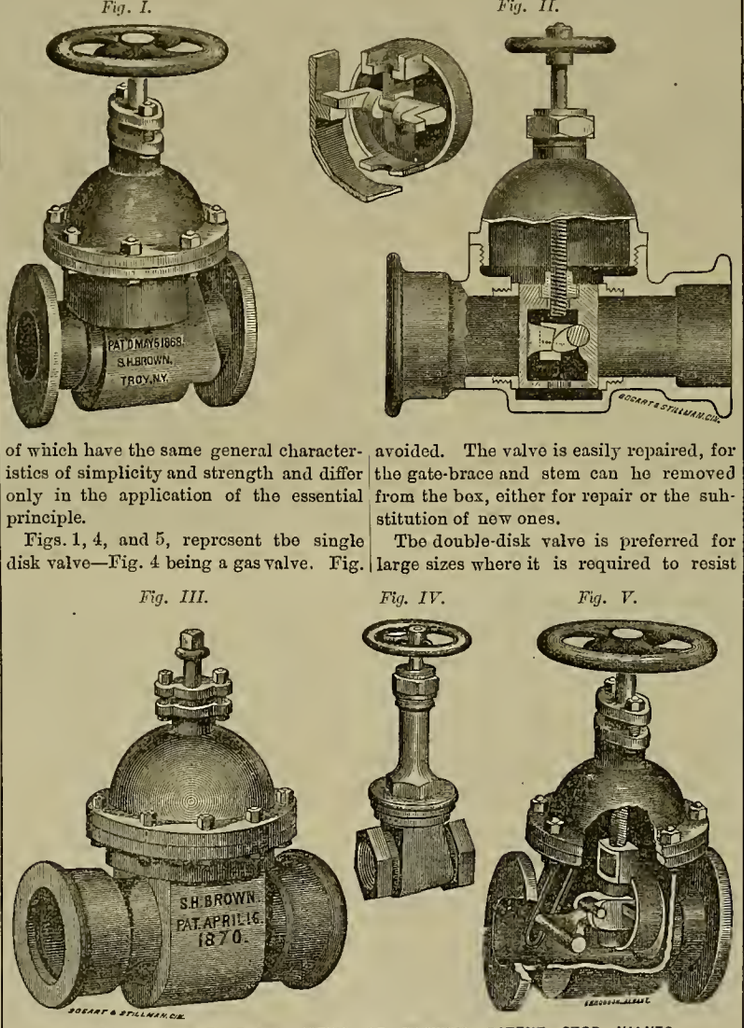
The Brown valve has become one of the standard valves in the Eastern States, but has only been lately introduced on this Coast. In view of its popularity there and its evident efficiency, we desire briefly to call attention to some of its distinctive features and advantages. The valve is made with single and double disks, both of which have the same general characteristics of simplicity and strength and differ only in the application of the essential principle.

Figs. 1, 4, and 5, represent the single disk valve—Fig. 4 being a gas valve. Fig. 5 is a sectional view, the working parts of which will explain themselves to any mechanic. The peculiarity of construction in these valves admits the flow direct and of the full size of the pipe. The gate is held gently to its seat, by ribs in the box so that as it moves it clears the seat of any foreign substances likely to hinder its action and cause leakage. The brace for tightening the gate moves freely with it until the gate is full closed, for its cross-piece slides on inclined ribs in the box. When the gate closes, the cross-piece reaches its rest, and the brace takes effect and presses the gate to its seat, very slight force effecting powerful pressure, the brace being nearly at right angles to the gate when at its rest. The pressure of the brace being at the centre of the gate, naturally presses every part firmly to its seat, and prevents unequal bearing and consequent leakage.

The brace, though pressing powerfully, is set free easily and instantly since it has a slight incline and a rolling motion at each end; all danger of sticking is thus avoided. The valve is easily repaired, for the gate-brace and stem can be removed from the box, either for repair or the substitution of new ones.

The double-disk valve is preferred for large sizes where it is required to resist great pressures upon either side. Fig. 3 represents the double disk valve, Fig. 2 a sectional view of it, and the small figure to the left shows the construction of the double cam and its manner of operation. The adjustment of the gates in the box is so accurate that while friction is avoided in raising and lowering them they are retained in their position without undue pressure upon the stem or other parts, and in the event of one disk becoming defective in any way, the other is held more firmly against its seat by the water between the disks. The gates are opened and closed by means of a cam, shaft and levers, combined in a single casting, whereby the construction is materially simplified. The cam having a center bearing is very powerful and its operation requires only a slight application of force; it also distributes the power uniformly in all directions while its prompt action precludes all possibility of sticking. The disks are closed tightly and held firmly in their seats by the action of the cam and the pressure is relieved instantly, all grinding of surfaces being avoided thereby. As the disks move freely in the box, the liability of becoming clogged or impeded in their action by the accumulation of sediment is avoided.

The valves are, by their peculiar construction, and freeness from liability of leakage, equally applicable for gas, steam or water, the double disk being preferred for large sizes where it is required to resist great pressures upon either side, but for all sizes under eight inches, there is very little difference in the action of the two valves. In their manufacture, materials of the first quality are employed, the composition for stems and mountings being of copper and tin, without zinc or spelter and exceedingly hard and strong. They are guaranteed by the makers to withstand any hydraulic pressure ever required of water gates under the Holly or any other pumping system. They have been adopted by numerous water works in different sections of the country, and the agents have a great number of certificates attesting to their general efficiency from prominent engineers throughout the Atlantic States. The valves are endorsed and approved by the leading engineers of this Coast also. The Mechanics' Institute awarded a diploma to the valve at the last exhibition as tending towards the solution of the question of tight valves which can be easily removed without liability of destruction of faces, and which have a clear open port for discharge. The valves can be seen at Brittain Holbrook & Co's. in this city, they being the agents for California.



INTERNAL AND EXTERNAL VIEWS OF BROWN'S PATENT STOP VALVES.

Discovery of Quicksilver.—A correspondent of the Napa *Reporter* writing from Yountville says that some rich quicksilver discoveries have been made a few miles from the Little Geysers. An offer of $10,000 cash has been made to the lucky owners, for a part interest, what part is not stated. Another company have offered $25,000 for the whole mine. Other discoveries have lately been made between the Knoxville and Phenix mine. These discoveries, with the Whitton, Steckter and Oakville mines would lead to the supposition of somewhat extensive deposits of ore around the head of Napa Valley.

Emma Mine.—Recent rich developments are reported in the famous Emma mine, Little Cottenwood, U. T. At a depth of 400 feet a body of ore has been struck running $1,900 per ton. English experts who have visited the mine are asserted to have placed its value at $20,000,000.

The Carihou mining interests, in British Columbia, are reported as flourishing.

CORRESPONDENCE.

Notes of Travel in Nevada County.

[By our Traveling Correspondent.]

Union Gravel Mine.

The above named mine is located at Relief Hill, 3 miles east of North Bloomfield, has 9 owners, one of whom, M. Arfman, is Superintendent. It was first located in 1856, and has heen successfully worked ever since. At present writing they are workiug 10 men drifting, aud washing with one of Fisher's "Hydraulic Chief" monitors; will add another monitor next month. This claim has averaged $1,200 per month, and last month $2,500 was cleaned up. This, together with 4 other claims at present working here, are bonded to an English Co. for $250,000; verily the English will soon own us, body and boots.

Nevada City,

The county seat of this county, is located about 40 miles east of Marysville, and 12 miles north of Colfax; it is situated at an elevation of 2,600 feet above the sea level, and contains ahout 5,000 inhahitants. There are two first-class hotels here, and several fine manufactories.

The rainfall at this place for the past 10 years is as follows: Winter of 1862 and spring of 1863, was 27.87 inches; '63 and '64, 17.28; '64 and '65, 54.49; '65 and '66, 59.26; '66 and '67, 81.56; '67 and '68, 115.26; '68 and '69, 56.69; '69 and '70, 53.15; '70 and '71, 45.35; '71 and '72, 70 inches had fallen up to March 7th, 1872.

Something for the Signal Service to work out is, why the great difference in rainfall hetween Nevada City, and Grass Valley, only 4 miles apart, and the difference in elevation but 100 feet, the former place being the highest; while the difference in rainfall each winter is from 6 to 15 inches more at Nevada City than at Grass Valley. Up to the present writing this winter, the latter named place has 10 inches less than the former.

The "Hydraulic Chief,"

Invented, and now being manufactured hy Frank H. Fisher, at this place, is one of the important inventions, now used for hydraulic mining. The "monitor" costs from $150, to $300, (accordiug to size,) and can be used under any pressure that a pipe can stand to convey water to it. Now being used under a pressure of 370 feet, 40 of them having been manufactured (and sold) by Mr. Fisher during the past year, and all I have had the pleasure to see in operation (some 6 or 8) gave perfect satisfaction. Mr. Fisher also manufactures all kinds of machinery common to a machine shop.

Thom & Allen, proprietors of the Nevada Iron and Brass Foundry—are the principal manufacturers at this place, of quartz and sawmill machinery. Their works are driven by an engine of 20 horse power, and 10 men are regularly employed. As fine castings are turned out here as any where in the State.

Hardware and Powder.

The priucipal hardware merchants of this place are Geo. E. Turner aud W. H. Crawford, the former is general agent in this section, of the Giant Powder Co., and the latter is the agent of Gun Cotton; from the looks of their stock on hand, I should say an immense amount of hardware and explosives were disposed of here annually.

Buckeye Quartz Mine.

This mine is located 2½ miles N. E. of Nevada City, in Willow valley. R. W. Tully, banker of Nevada, and Jas. Kitts are proprietors; the latter is superintendent. They have excellent hoisting works on the mine (put up in Oct. last) which are run by an engine of 16 horse-power, their principle shaft is down 210 fcet, at an angle of 45°; this ledge will average 4½ feet, and runs as high as 10 feet in width; now rnnning levels, aud employing regularly 9 men. When stoping, they can take out 20 tons of rock daily—which has averaged thus far $13.25 per ton, and now prospects better; milling the rock at the Oriental mill, 1 mile away.

Grass Valley,

Located 4 miles south of Nevada City, is the larger of the two places, and contains (ineluding its floating population) 8,000 souls. As regards the recent disturhances here, I am happy to state, that the hetter judgment of the more intelligent members of the Miners Union of Grass Valley, has prevailed, resistance to prevent such men as wished to use "Giant Powder" has been withdrawn, and peace and quiet now reign supreme. The Grass Valley *Union*, and *Republican*, have thoroughly ventilated the suhject, and left nothing more to he said.

The Defiance Quartz M. Co.,

Located on Oshorn Hill, 1½ miles southeast of Grass Valley is superintended by Con. Reilley. They give the following as their experience in the use of Giant No. 2 Powder *vs.* Black Powder. They are sinking a perpeudicular shaft, now down 112 feet; at that depth they took out 30 tons of rock, hy single hand drilling, aud No. 2 Giant Powder for hlasting at a cost of $20 per ton. The same number of tons taken out ahove that, with large drills and the use of black powder cost them $40 per ton. From 6 to 8 men are regularly employed, and three of whom I conversed with, acknowledged their willingness to work this powder, and stated they were in as good health as when they began the joh.

Carney & Goodspeed's

Cement mill and mine are located at Hunt's Hill, six miles East of Nevada City. They have an 8 stamp mill run hy water power, with a 24 foot hurdy-gurdy wheel on a cam-shaft, without other gearing. This mill has a capacity of and is now crushing 50 tons of cement every 20 hours, which averages $5 per ton. This company have a tunnel in 800 feet, at which point they are drifting in different directions, working regularly 28 men. The gravel or cement, is taken out of the tunnel hy car to the mill, which is located at the mouth of the tunnel. This tunnel is rather badly ventilated at present, for the reason that but 15 feet fall can be had for the water to run their air pipe with. Different arrangements will shortly be made for better veutilation. At present using black powder, but are ahout to experiment with giant for their cement blasting.

You Bet

Is a phrase much nsed hy Californians, as well as people in the East, but perhaps it will surprise some who read this letter to know that a town actually exists under this euphoneous and expressive title. One miner's explanation as to its precise locality was, "half way hetwcen Red Dog and Hardscrahble," but to more fully define its geographical position in our fair State it is *at present* located 9 miles northeast of Novada City, and contaius about 200 inhahitants. Owing to the rich gravel hed which underlies it, it hecomes necessary to move the town frequently, to get at the hidden treasures heneath. The town may therefore be said to possess one of the characteristics of a California prospector, that of heiug always on the move." Oliver Fox & Co. aro the merchants of the place and the hotel is well kept by Pete Drunzer.

Birdseye Creek G. M. Co., (Limited.)

The possessions of this company extend from ncar Hunt's Hill to the vicinity of Little York, and comprise all that portion of the deep channel "Blue Lead" at Red Dog, You Bet, and the vicinity beyond. The entire length of the company's claims is about four miles, all the hed rock of which will not probably be scen for the next huudred years. The company is an English one, having its principal office in London. It is managed by a Board of five trustees and is ahly superiuteuded hy J. A. Stone, Esq., of You Bet. At present they are working three sets of claims, viz.: the "Uncle Sam," of which Geo. H. Powers is foreman; "Brown's Hill," Frank Ennis, foreman; and the "Neece & West," J. R. Flagg, foreman. In the ahove named claims there are from 25 to 30 men regularly employed, running from five to six hydraulic monitors, carrying from 250 to 400 inches of water each. This company is at present engaged in running a bed-rock tunnel to the "Neece & West," that will, when completed, drain hoth that and the Brown's Hill claims. The dimeusions will be 1,100 feet long, 7 feet wide by 8 high, 260 feet of which is now completed; a hard slate formation exists as far as pierced. In addition this compauy own the "Independence" and "Bunker Hill" property, and extensive claims at Sweetland.

As to the amount of hullion taken out, but little is known to the outside world, hut when under their former ownerships, they did pay extensively, and as they never looked hetter than they do now the supposition is that our Euglish friends are reaping good pecuniary benefits from their enterprise.

Little York

Does not present a very pleasing appearance to the eye, hut is, nevertheless, one of the liveliest mining camps of its size that is situated on the deep channel. Its location is ahout 2½ miles west of Dutch Flat, and the same distance east from You Bet. It contains about 300 inhabitants, and in addition to its miniug characteristics, has produced some of the finest fruit in the country. The miners, in addion to their labors of extracting the precious metals from the ground, have also taken some trouble to heautify their homes with small gardens, in which effort they have been unusually successful.

Last fall they held a fair at Little York for the benefit of the school fund, and the exhihition would have done credit to an agricultural commuuity. There were exhihited, 18 or 20 varieties of grapes, 43 varieties of apples, 30 of pears, 16 of peaches, besides plums, almonds, apricots, nectarines, and other different vegetahles. It was said hy visitors who visited the State Fair as well as the ono held here, that it eclipsed the former in perfectiou and size of fruit, and equalled it in variety. There were peaches shown there that weighed from 16 to 24 ounces each, and pears from 23 to 28 ounces. This manner of comhining agricultural and mining pursuits, is somewhat unusual, and what is more unusual, is, that they seem to have heen successful in both.

Little York Water & Mining Co.

The principal works and office of this company aro located here (Little York). Its owners are R. F. Knox of San Francisco, Martin Hoyt, of Virginia, Nev., W. W. Cozzens and G. H. Atkins of Little York. Mr. Cozzens is manager, and Mr. Atkins general Superiutendent. The possessions of the company comprise, Little York, Christmas Hill and Liberty Hill—ahout 600 acres of mining ground covered by United States Patent—extending from Little York to Liherty Hill, a distauce of 4 miles, but not connected all the way by pay gravel, a high mountain causing a hreak in the channel. The channel proper is not over 300 feet wide at this point (Little York), but a deposit of hlue gravel exists—nearly a mile in width—which, at points, is several hundred feet deep and extending high up on to the rim rock. At present, working 4 sets of Hoskin's "Little Giant" monitors, one in each claim, one of which is used under a pressure of 340 feet, employing a 4-inch nozzle through which 650 inches of water is forced. Thoy are employing regularly about 50 men and using the most improved machinery aud hlasting agents, such as monitors, under-currents, giant powder, etc. They also use an improved coupling hand (illustrated in the SCIENTIFIO PRESS, Sept., 1870) not original here, but a patented invention considered indispensable for coupling pipe, and certainly the chaapest and most convenient affair for the purpose that I have evor seen.

Just below Little York in one of tho abovo mentioned claims is a very peculiar land slide or land glacier. A large piece of ground some 40 acres in extent, against the faco of which they are piping, is moving slowly down the hill, taking with it houses, flumes, trees and everything in its way. The pipes have not beeu moved for nearly a month, the hill meeting them in a conveuient manner. The miuers have some of them heen compelled to move their cahins to some more steady locality.

Ditches and Mills.

This company also own 1,900 acres of fine timber land with a first-class sawmill run hy water-power, which has a capacity of making 15,000 feet of lumher per day (of 10 hours). They have one of the finest water privileges in the State, consisting of three ditches which have a comhined length of 43 miles, with three reservoirs. These ditches have a capacity of furnishing 3,000 inches of water day and night. From the receipts for water sold and bullion taken out, this property combined is satisfying its owners, and has caused general admiration in the way it is managed.

Aplin's claim, adjoining the above on the west, is quite an extensive gravel deposit and at present writing is paying well; working 8 men night and day aud using one of Hoskin's monitors.

I find a great deal of complaint among the miuers along the gravel range of which I have spoken, on the subject of gum boots. They say that they are unable to procure any that will last for more than 6 weeks and will not turn water more than half that time. Either a spurious brand of the kind they have been accustomed to buy has found its way there or they don't make them as well as they used to. The store keepers say they can procure no hetter, hut some enterprising firm that do manufacture a superior article would find ready sales for their wares in the localities mentioned.

L. P. MC.

Mining in Inyo County.

ED. PRESS:—Since my last, several items of interest and benefit to this county have occurred; and judging from paragraphs in different journals in the surrounding country, this county is attracting more and more attention every day.

Lida Valley is situated ahout 100 miles northeast of this place, and is at present creating qnite a stir. Messrs. Hiskey & Walker of the Deep Springs Mill, have made three very successful runs upon ore from that district, and intend to remove their mill immediately to those mines. The ore yields from $800 to $900 per ton. The bullion is worth something over $1 per oz.

Eclipse.

The mill and furnace of this company are in constant operation, hut with what succes I am unahle to learn. Mr. Morris of your city, and formerly the assayer and amalgamator of the above company, is now engaged in opening a mine for a San Francisco Co. in Mazurka Cañon, Russ district, (directly east of this town) called the Blue Bell. He has extracted several tons of ore, and shipped it to San Francisco for reduction.

Improvement in Working Ores.

The proprietors of Cerro Gordo, and the Owens Lake Silver-Lead Companies have heen experimenting upon their respective ores, and find that they can reduce them from the raw state, *i. e.*, without running them into slags or matt., which will greatly reduce the cost of working, and give an impetus to

Mining in Cerro Gordo,

Where all the ores are ohtained that is reduced by the above companies. The Belmont, Wittekind, San Lucas, Omega, Santa, Maria, and uumerous other mines are taking out, and find ready sale for all their ore. The furnaces are in constant operation and are at prcseut the main-stay of the whole country. A steamhoat for Owens Lake, is now in course of construction hy parties connected with the O. L. S. L. Co., for the transportation of wood, coal, ores, and other freight, which will increase the facilities of that company at least 5 per cent.

Agriculture.

Owing to the copious falls of snow during this winter ou the Sierra Nevada's skirting this valley, farmers are preparing to put in large crops of the different cereals, as well as root crops. The farming land in this valley is fast being settled upon, wherever water can he had naturally for irrigation. But there still remains many hundreds of acres of good land unoccupied that can easily he irrigated hy

Artesian Wells.

There is uo hetter show in the State to make money by parties understandiug that business, with necessary tools, and capital to carry it on, than in Owen's Valley. That there is a running stream of water underlying this valley from the mountains, is demonstrated by the fact, that, large running springs break forth in the centre of the valley, from one end to the other, and two especially (Fish Springs, and Black Rock Spring) form streams that irrigate one-tenth of the present occupied farm lands of the county.

EXILE.

Independence, March 15th, 1872.

GROWTH OF SAN FRANCISOO.—The total number of huildings now in course of orcction or which have been just finished is 105. They comprise 3 churches, 1 gas works, 1 hall, 1 addition to a factory, the new City Hall, the new City and County Hospital, 29 private residences, 34 dwelling houses, 10 tenement houses and 24 stores. The amount expended on them since the heginning of 1871 is $2,698,012.

Adding to these the buildings *finished* hefore the end of 1871, we fiud that from the 1st of January, 1871, to March 28, 1872, there have heen erected and are now in course of erection 416 buildings. These comprise 4 churches, 3 puhlic buildings, 1 gas works, 54 stores, 3 halls, 3 factories, aud 348 private residences, dwelling houses and tenements. The total cost has been $4,316,712.—*Bulletin.*

SOUTHERN INDIANA is fiuding itself rich in black coal, a very valuable variety for treating iron ore, and also plenty of iron ore itself in happy proximity. Couscquently, there is a great increase of the irou-making busiuess in that section.

SOUTHERN NEVADA AND ARIZONA EXPLORATION.—Lieut. Wheeler's party, which was in the field from May to December last, is now engaged in preparing an official report at Washington.

Mechanical Progress.

Light vs. Heavy Shafting.—The *Scientific American* gives a very instructive article on Light vs. Heavy shafting, the summing up of which is as follows:—To sustain great pressure requires great strength, and increased strength of a given material having a specified form implies increased weight. Increased weight implies increased friction. It is, therefore, a theoretical fact proved in practice that the heavier a line of shafting is, the greater will be the loss in friction during the transmission of power through it. It is also a fact that light shafting running at high speed will perform work that would break heavier shafting running at lower speed.

We have here a plain argument in favor of light shafting. In the applications of these principles, however, we often see errors committed which tend to render some people skeptical as to their truth.

One of these errors is that light shafting is often not properly supported. The lighter the shafting, the more apt it is to spring by its own weight, the weight of pulleys and gears, and the tension of belts. Light shafting will require, therefore, more frequent support from hangers than heavy shafting. Besides, with high velocities, there is more fiddle-string vibration, aided by centrifugal force, which consumes more or less power, generally more than is suspected. The obviation of this calls for frequent supports along the lines of shafting, with accurate fitting of couplings, journals and boxes, and as perfect alignment of the shafting as possible.

To keep everything in perfect order will also require constant watchfulness. Slight settling of buildings, springing of floors, from the placing of new and heavy machinery or other cause, alterations which cannot be prevented, will often throw a shaft out of line, no matter how perfectly it may have been hung.

A cognate subject to the above is the size of pulley, which the editor promises to consider in a future article.

Boiler Explosions.—Prof. R. H. Thurston has published in pamphlet form a report of the trials made last fall at Sandy Hook. He draws the following conclusions: 1. Low water, although undoubtedly one cause, is not the only cause of violent explosions, as is so commonly supposed, but a most violent explosion may occur with the boiler well supplied with water. 2. What is generally considered a moderate steam pressure may produce a very violent explosion of a weak boiler, containing a large body of water, and having its flues well covered. 3. A steam boiler may explode under steam at a pressure less than that which it has successfully withstood at the hydrostatic test. In a subsequent letter to the *Eng. and Min. Journal*, which demurred to the first part of conclusion I, the Professor explains that he referred to a very prevalent belief among those managing steam boilers that an explosion may always be attributed to low water and that the invariable effect of over pressure is simply to rupture the weakest spot, allowing steam and water to blow out until the pressure is taken off. The consequent feeling of safety among engine-drivers and firemen, having charge of boilers rendered unsafe by other causes, has been, probably, the cause of many explosions and loss of life. The removal of this false impression will assist greatly in making the real causes of the majority of explosions—corrosion and carlessness or ignorance in management—better recognized.

New Process of Obtaining Iron and Steel. Some of the European scientific journals speak favorably of a new invention, said to have been recently perfected, for producing iron and steel. The heat is mainly derived from combustion of carburetted air, while uncombined oxygen and nitrous oxide gas are evolved from nitrite of soda and quicklime, and chlorine and carbonic oxide from a compound of chloride of lime mixed with pulverized charcoal.

The air charged with the vapor of petroleum oil, besides acting as a gaseous fuel, also acts powerfully as a reducing agent, and rapidly effects the reduction of the iron from the ore.

The air charged with chlorine and carbonic oxide, removes wholly or mainly all sulphur or phosphorous with which the ore or reduced iron may be contaminated; and the air charged with oxygen, nitrogen, nitrous acid and nitrous oxide, promotes combustion, and rapidly raises the materials to the temperature required.

The Road Steamer seems to be making practical progress in Great Britain. One of these machines recently made the run from Ipswich to Edinburgh by road, a distance of 450 miles, in seventy-seven hours' traveling time. The engine is one of four now being built for the Indian Government, under Thomson's patent, with india rubber tires, and is of 14 nominal horse-power, but which has been worked up to 80 indicated horse-power. Her weight is about 13½ tons; length, 15 feet; breadth, 8 feet 8 inches; height to top of chimney, 15 feet. The omnibus weighs about 3½ tons and seats 21 passengers inside and 14 outside.

Rubber Carriages.—A factory is being erected at Fairfield, Conn., in which carriages are to be built consisting entirely of India rubber, with the exception of the axles and tires—this material being claimed to possess decided superiority over wood.

Compensating Compass.—According to London *Engineering*, M. Arson, of Paris, has invented a compensating apparatus of much merit, for correcting the deviation of the compass on board ships. He compensates the deviation due to the permanent magnetism by fixed magnets, and those caused by induced magnetism in all positions of the ship and in all latitudes by bundles of soft iron wire placed according to certain laws given by calculations. The apparatus contains, besides the ordinary card, a second card serving as an indicator. When it is wished to follow a certain route, this latter card is traced by means of a wheel until it indicates the desired angle. By this movement the packets of soft iron are placed in the position required to compensate for the deviation corresponding to the position of the ship. It is then sufficient to adjust the compass needle to the same angle which has been given in order to follow the route indicated. Conversely, to find at any moment the route being followed, the wheel before mentioned is moved until the repeating circle indicates the same angle as the compass. By this movement the compensating parts will have been placed in the position which corresponds to the compensation in the azimuth where the vessel is; the angle observed will be the true angle of the route.

A New Fire-Proof Composition.—An important trial of fire-proof composition was made at Washington the other day, under the direction of the Secretaries of the Treasury and Navy. An iron chest, sixteen inches in diameter, with a lining of six inches of the composition, also containing a wooden box four inches diameter, in which were deposited papers, money and matches, was placed in the blast furnace of the navy yard, and different metals placed all round it. After being subjected to an almost continuous blast of three hours, and after all the metals were melted, the chest was left in the furnace until the next afternoon, when under the directions of the representatives of the Government, the three chests were opened, and the contents were found to be in exactly the same condition as when they were put in, and the matches were used to light cigars with. The fire-proof composition is the discovery of two gentlemen of Detroit, one of whom was present at the trial.

Wooden Nails.—The editor of *The Hub*, the carriage makers' journal, thinks the idea of using wooden nails a good one, for in his opinion the day will come before many years when wood will become so valuable that it will not pay to use the material of old packing boxes for fuel as is now done, and then the objection to the use of iron nails will be seen in a practical light. If boxes were put together with nails of wood the injury to tools in making them serve for other purposes would be materially lessened, and a great saving of valuable lumber be made. It is not to be supposed that wooden pegs or pins can be made to supplant iron nails and screws altogether, yet the lavish use of nails may be checked perhaps with advantage to our industries. The object is worthy of our consideration.

Weight of Rails.—Mr. L. Nickerson, in the *Railway Register*, questions the soundness of the general opinion that great weight in a rail is necessary to economical wear. When a body, as a bar of iron resting on an anvil, is struck with a hammer, the effect on it is the greater the more unyielding the substance on which the body rests. Now increasing the body of the rail is the same as giving a more unyielding support to its crown, and thus increasing the effect of the hammering action of the wheels of cars and engines.

Lubrication of Steam Engines.—M. Thoma tried a mixture of graphite (prepared by decantation) and hog's lard for lubricating steam engines with good results, the only care requisite being to keep up the quantity of graphite in the mixture, as otherwise it becomes too fluid. He next tried a paste of graphite and water with equally good results, the slight escape of steam into the stuffing-box being sufficient to keep the graphite moist.—*Railway Times.*

Sponge Paper, a late French invention, is made by adding finely divided sponge to ordinary paper pulp. The paper is said to have all the peculiarities of sponge, absorbing moisture readily, and retaining it for a long time. It has been used to advantage for dressing wounds, and is capable of several important technical applications.

Wire Tramway.—Mr. T. Bush, an Hungarian Engineer, has made some improvements on the Hodson system of wire tramways, by employing two parallel cables instead of one. The modified system is said to possess great advantages over the original one, especially with regard to the carrying of heavy loads and the greater security of the ropes.

The University of Pennsylvania is now in possession of the largest electric machine in the world—a Holy pattern, with a 36-inch revolving plate. The machine will evolve an 18-inch spark, which will pierce glass to the depth of 8 inches.

Uniformity in Car Building—A plan to make all railroad cars throughout Germany of one pattern, so that repairs may be facilitated and prices equalized, has been proposed by a scientific association of railroads in that country.

Scientific Progress.

Variation of Color in Birds with the Locality.

The subject of variation of color in birds, as expressing specific distinctions, has for a long time occupied the attention of ornithologists; and while with some the slightest difference in shade was sufficient to establish a separate species, a wide variation was allowed by others without effecting the idea of specific indentity. We are gradually, however, coming to appreciate the influence which external conditions, such as light or shade, moisture or dryness, varying temperature, latitude, etc., produce upon color; and so long as the general pattern remains the same, we can allow a great variation in tint, and even in size, since, as is well known, this depends largely upon latitude or altitude of birth-place and residence. As a general rule, it may be said as we go southward from a north temperate latitude, with the increasing temperature and brighter sky the colors are deeper and the size less; and, on the other hand, in proceeding northward and into more clouded atmospheres, the dimensions become greater, with a decrease in general brilliancy. In sandy or barren regions the accompanying birds become of a grayish tint, while in red soils a reddish shade will be appreciable.

Again, in certain regions the birds exhibit a tendency to melanism, or a blackening, this being noticeable in Florida, and more especially in the West India Islands, as compared with the United States. An instance of this is seen in the common red-winged blackbird, the female of which, as found in the United States, is variegated with brown, yellowish, and grayish streaks, the male alone being a glossy black, with red shoulders. A blackbird is found in Cuba, however, the male of which is undistinguishable from our bird, excepting in the smaller size, while the female is of a uniform lustrous black, differing only from the male in the absence of red upon the shoulders. Similar comparative peculiarities are presented in quite a number of West Indian birds.—*Harper's Sci.*

Faye's View of the Physical Condition of the Sun.—The *Mechanic's Magazine* gives a summary of an interesting paper by Mr. Faye, upon the physical condition of the sun, deduced from the observation of the solar spots made by Carrington. This is expressed in the following propositions:

1. That Zöllner's theory, which views the sun as a solid body covered with a layer of incandescent liquid, is entirely improbable, and, indeed, impossible. 2. The speed of rotation of any point whatever, on the sun's surface is always expressed by one and the same formula. 3. There do not exist on the sun's surface any sensible currents which are at all analogous to the "trade-winds." 4. The absolute absence of currents is only explicable by the presence everywhere of ascending currents of great intensity, proceeding from the sun's center to its surface. 5. The existence of such currents is an imperative proof that the body of the sun must be in a gaseous state, and is an immense sphere of æriform matter of an enormous temperature, but which is continually cooling by the action of the ascending currents. 6. The sun is absolutely spherical.

New Reducing Agent.—If an aqueous solution of sulphurous acid be allowed to act upon fine zinc dust, the zinc is dissolved without the development of gas, the solution assuming for a time a decided yellow color. This liquid now possesses the peculiarity in a very high degree of rapidly decolorizing indigo, a fact well known to chemists. Schutzenberger, ascertained that this decolorizing of the indigo is by no means the result of oxidation, but, on the contrary, is a reduction; and this power of reduction in the liquid is so extraordinarily great that it will reduce, with heat, the salts of copper, silver, and mercury to their metals. The liquid is not related to hydrosulphuric acid, and is exceedingly unstable in its free condition; but if a concentrated solution of bisulphite of soda be allowed to act upon the zinc filings, we shall obtain a soda salt of the new acid which has as great an affinity for oxygen as the free acid, and can, therefore, be kept for any length of time if completely excluded from the air.

Hailstones of Salt and Iron Sulphide.—According to *Nature*, Prof. Kenngotb, of Zurich, Switzerland, during a hailstorm, lasting 5 minutes, on the 20th of last August, found stones, some weighing 12 grains, which consisted essentially of common salt, mainly in imperfect cubical crystals. He supposes that the salt had been taken up from the salt plains of Africa and brought over the Mediterranean. Hailstones containing each a small crystal of sulphide of iron, probably weathered out of rocks in the vicinity, fell recently at Kazan.

Crystallization.—Professor Chultze has recently exhibited, to the German Chemical Society, Berlin, beautifully formed crystals of sugar, borax, and other substances. He states that by the use of a gelatinizing substance as a solvent, the formation of perfect crystals is much promoted. Solutions of gelatine and kindred substances were the vehicles he employed.

Tungsten Colors.—Fine colors are prepared from tungsten, which, being permanent and little acted upon by heat, can be used to advantage on many occasions. Tungstate of baryta is a pure white; tungstate of nickel, clear green; tungstate of chromium, dark green; tungstate of cobalt, violet; tungstic acid, a beautiful clear yellow, passing into orange. Tungstate of soda is not employed in colors, but is recommended for rendering fabrics unflammable, for this purpose it is better to combine it with phosphate of soda. Metallic tungsten was at one time supposed to improve the hardness of steel, but we hear very little of its use for this purpose, and it seems more probable that the accidental admixture of manganese was the real indurating constituent. It is also claimed that tungsten largely increases the magnetic power of iron.

Spectrum of the Fire-Fly.—Prof. C. A. Young says this is "perfectly continuous, without trace of either bright or dark lines, and extends from a little above Fraunhofer's line C, in the scarlet, to about F in the blue, gradually fading out at the extremities. It is noticeable that precisely this portion of the spectrum is composed of rays, which, while they more powerfully than any other affect the organs of vision, produce hardly any thermal or actinic effect. In other words, very little of the energy expended in the flash of the fire-fly is wasted. It is quite different with our artificial methods of illumination. In the case of an ordinary gas-light, the best experiments show that not more than one or two per cent. of the radiant energy consists of *visible rays;* the rest is either invisible heat or actinism; that is to say, over ninety-eight per cent. of the gas is wasted in producing rays that do not help in making objects visible."

New Preservative Fluid.—The following are the ingredients of a liquid by means of which the organs of the body that have become absolutely offensive, from decay, may be treated so that they can be examined for marks of injury or signs of disease. The fluid consists of a mixture of iodine one drachm, methylated ether (of specific gravity ·720) ten fluid ounces, absolute alcohol one fluid ounce, and strong sulphuric acid four fluid drachms. The action of the solution seems to be that the iodine deodorizes, while the sulphuric acid engages the water and the alkaline products of decomposition and produces the necessary firmness of structure. The ether escapes, being simply the fluid dissolvent for the other agents.

Phosphorescence Produced by Frictional Electricity.—M. Alvergniat states that if a little bromide or chloride of silicum is introduced into a glass tube, and the tube is then exhausted and sealed, friction with a piece of silk, or even with the fingers, produces a beautiful phosphorescence, which is rose colored if the chloride is contained in the tube, and a yellowish green with the bromide. The induction spark produces no light within these tubes unless the vacuum is very perfect, but in that case the phosphorescence disappears.

Secchi on Solar Protuberances. — The Italian astronomer, Father Secchi, has published several papers on the above subject, in which the conclusions arrived at are summed up thus: 1. The southern hemisphere of the sun is at present richer in protuberances than the northern hemisphere. 2. In general terms, the protuberances are numerous in those regions where the facuæ are numerous. 3. The protuberances are highest in the regions where they are the most numerous.

Silica, Diamagnetic.—Prof. Dove has successfully suspended, between the poles of a powerful electro-maguet, sections cut from colorless rock-crystal, smoky quartz, agates composed of alternating layers, chalcedony, jasper, ametbyst, and other varieties of quartz. Their uniform behavior in the magnetic field shows that all the different kinds of native silica are diamagnetic.

Temperature of the Sun.—This varies according to the different calculations, from 10,000,000° to 1,461° C. Mr. Vicaire, in a note to the French Academy of Sciences, concludes that it does not exceed 3,000° C. (5,400° F.) He observes that the greatest heat of the oxyhydrogen blowpipe is 2,500° C. (4,500 F.), and the highest furnace heat not above 2,000° C. (3,600° F.)

A new method of preparing sulphuretted hydrogen has been proposed. By heating a mixture of equal parts of sulphur and paraffine in a flask to a temperature not much above the melting point of the sulphur, the gas is evolved with great steadiness. The production may be stopped or renewed at pleasure by simply withdrawing or applying the lamp.

New Fossil Mammal of Utah.—Dr. F. V. Hayden discovered two species of *Bathmodon* in the Tertiary bed (bourn eocence?) of the Wahsatch group, near Evanston, Utah. The characters of the molar teeth indicate that it belongs to a new family.—*Amer. Jour. of Science.*

The Cordoba Observatory.—The inauguration of this observatory, an event of great importance to astronomical science, took place on the 24th of October last in the presence of the dignitaries of the land. Prof. Gould delivered an excellent address.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior,in proximity to the mines mentioned.

California.

ALPINE COUNTY.

TARSHISH.—Monitor *Miner*, March 23: At 12 o'clock yesterday the mill started up.

THE finest body of ore opened in Alpine was struck in the Silver Glance this week. It is a continuation of the vein heing worked in the Monitor No. 3 and heing 300 ft. deepsr, shows that vein to hs not only continuous, hut richer as depth is reached.

WE anticipate a lively season. The Tarshish, M. & N. W., Leviathan and Globe, which have ore in sight; work from 25 to 75 men each. The Sovereign, Mountain, American, Morning Star, Winchester, Marion aud others are already talked of as sure to start up. We expect to see 500 men at work in this vicinity hefore Sept. next.

AMADOR COUNTY.

ONEIDA.—Jackson *Ledger*, March 23: The mill has stopped for waut of fuel, yet the hoisting works are operating and a large amount of rich rock lies in the mill ready for crushing. Supt. Morgan is engaged in erecting a building and hoisting works on the North shaft.

GOOD CLEAN UP.—The tuunel or hill claim of Señor Domingo Araus, at Jackson Gate, 3 miles north of town, after a run of 15 days, cleaned up a little over $1,000. This mine is worked by 3 men who draw out the dirt and pile it up until they accnmulate sufficient to make a 15-day's run, when they wash it by the hydraulic process.

PLYMOUTH.—Cor. same: The Phœnix is turning out good rock. The Co. expect to huild a 20-stamp mill near the mine soon, to be driven by water power. The Alpine is progressing downwards, and their mill is not running, but will prohably start up soon. The Condo is turning out rich rock. As soou as the road settles they will haul 150 tons to the mill. The Philadelphia is rnnning a low grade ore with a large amount in sight. The Arastra claim still runs, making small wages on $2 rock.

PINE GROVE.—Cor. Jackson *Dispatch*, March 30: In the Barlow quartz mine the shaft is about 240 ft. deep, from which 14 men are running 2 tunnels—each of which is abont 100 ft. long. There are 16 men ahove ground employed in connection with the steam hoisting works, chopping timher, etc. The owners design to sink the Barlow shaft 100 ft. deeper, drive the tunnels, thoroughly prospect both veins, and then determine on the propriety of building a mill.

CALAVERAS COUNTY.

MACHINERY.—Calaveras *Chronicle*, March 30. The props. of the Prussian Hill mine, have purchased the French mill, at Rich Gulch Flat, and will move it to their works as soon as the roads will permit. The machinery consists of a 13-stamp hattery and a 30-horse power engiue, in good condition.

RAILROAD.—Iu the Petticoat on reaching the depth of 350 ft. a level has been run ahout 200 feet on the lead, disclosing a wide vein of gold-hearing quartz.

Work is progressing favorably on the Wolverine, in Wet Gulch. The shaft has reached a depth of about 200 ft., and a level is being run from the bottom.

The Free and Easy has heen pnrchased hy Mr. Porteous, who is working it to good advautage.

Clark's mill, leased by Sanderson & Pickering, is crushing rock from the Good Hope at Mosquito Gulch. There are 100 tons altogether which will pay at least $25 per ton.

JENNY LIND.—Cor. same: The hydraulic claims on Whisky Hill are rushing things through. The Bunker Hill Co. have suspended operations for the present so as to re-lay their flume.

INYO COUNTY.

WHITTEKIND ORE.—Inyo *Independent*, March 22: The assay value of the first-class ore heing extracted from the Whittekind mine, Cerro Gordo, is 406½ ozs. per ton; the second class reaching 180 ozs. The ledge has just heen tapped in the new tunnel.

SHIPMENT.—Los Angeles *News*, March 20: 1,330 bars of Cerro Gordo bullion were shipped from here to S. F. by the steamer California.

LOS ANGELES, March 26—By telegraph. 570 bars, base bullion, were received from Cerro Gordo to-day.

NAPA COUNTY.

GEYSER QUICKSILVER MINES.—Calistoga *Tribune*, March 28: The Original Geyser Quicksilver Mine was located on the 13th of Nov. 1871. The mine is about 2 miles west of the Geyser Springs, near the Hog's Back ridge. The first rock taken out assayed 13⅓ per cent. Better rock has since heen struck, which, it is thought, will assay 25 or 30 per cent. A large quantity of good rock is in sight, and the Co. are about to commence tunneling. Locations have been made on the same ledge.

NEVADA COUNTY.

GOOD SHIPMENT.—Grass Valley *Union*, March 27: Findley & Co. yesterday shipped to S. F., $20,500, the product of a short run of the Idaho and several other mines.

THE SITUATION.—Idaho is paying regularly. There is no deterioration in the ore, and no falling off in the strength of the ledge. Many improvements are in progress at mine and mill. The new shaft is to he 6 hy 20 ft. in the clear, and will he arranged for convenient and economical working. North Star will startup to-morrow, and in a few days a full complement of hands will he employed in the mine. There is on the dnmp ahout 300 tons of good rock waiting for the mill.

EMPIRE mine is running full-handed. Great quantities of rock are being taken out—so fast that their 20-stamp mill has to run night and day for the 7 days in the week, to keep up with the mine.

EUREKA mine makes no particular improvement. The men in the cross-cut from the 5th level are doing well in very hard rock with giant powder.

HEUSTON Hill for the last 6 or 8 months has been worked by contractors, who for the first 4 or 5 months made about $10 per day to the man. This rock did not hold out and as a consequeuce the mine is ahout to he abandoned.

Shamrock is being worked again, and steam machinery for hoisting and pnmping has been placed on the mine.

Knight of Malta is getting up an engine for hoisting and pumping, and in a few days regnlar work will commence.

Independence Con. on French Ravine, is worked by a tunnel giving 150 ft. backs. The tnnnel is in 130 ft. and 420 ft. mors will cnt the first large ledge.

Constitution mine, adjoiming the above, will soon continne their tunnel.

Washington, a new location, west and adjoining the Independence Co. has taksn ont good quartz lately.

Perrin Mine is taking out rock and running drifts.

Gen. Grant Mine, south of the Psrrin, is taking ont fine looking rock, which is accnmulating on the dnmp.

Branch Mint Mine, on the ridge, betwesn Deer and Wolf creeks, has a long tunnel which drains the ledge to a great depth, giving about 200 ft. of backs.

WILLOW VALLEY.—The last crnshiug from the Lecompton ledge, paid $60 por ton, and some previous crushings have yielded as high as $120. The mine is now idle for want of capital to erect machinery.

THE ledge owned by Brown & Gagan, is ahout 1½ ft. thick, and is rich in sulphnr ets. This mine was opened this season, the first crnshing paying $18 per tou.

IN the Buchanan, the last lot of rock crushed at the Oriental mill yielded $40 per ton. Tho Co. have out a large quantity of rock, which shows free gold and is rich iu sulphurets.

HECKER & Co., have a splendid ledge, which is 1½ ft. thick. The crushings havo yielded as high as $25 per ton, and none less than $18.

BUCKEYE Co. has a splendid 3-ft. ledge, and aro pushing ahead with energy. They aro taking out large quantities of rock, paying them from $22 to $25 per ton.

MURCHIE & Co.'s ledge excels any in richness in this township. The ledge is large, and is paying ahout $60 per ton. They have hoisting works, and an 8-stamp mill which is operating day and night. Murchie & Co. have been engaged for a long time running a tunnel to work a gravel range which they own, and while doing so, ran against the hest quartz ledge ever discovered in that section of country. The ledge is over a ft. thick, and will pay not less than $80 per ton. They picked out of the gravel claim some of the quartz, which was crushed and paid over $200 per ton.

THERE are a large numher of Cos. eugaged in prospecting, and every few days new discoveries are heing made.

LOCATED. — Grass Valley *Republican*, March 28: A. J. Doolittle and W. H. Raymond have located a water privilege of 2,000 inches of the surplus waters of Bear river, taking it out at a point hetween the Little York and Gold Run ditches, to he used at Liberty Hill.

H. H. Armstrong and others have located 1,000 ft. on the Reese & Dupew ledge, at Randolph Flat, commencing at the north houndary of Reese & Dupew's claims and extending 1,000 ft. in a northerly direction.

Alexander Haven and others have located 1,000 ft. on a ledge on Haven's ranch, to he known as the Washington Lode, located in Grass Valley township.

G. H. G. Stackhouse and othsrs have located 600 ft. on the Reese & Dupew ledge, commencing at the southern houndary of the south extension.

PLACER COUNTY.

GREENE MINE.—Placer *Herald*, March 30: The Co. is sinking a fine shaft, which is to he sunk ahout 215 ft., hy men working on 8 hour shifts. The 20-inch lode is lookiug splendid and averages in gold $200 per ft.

PLUMAS COUNTY.

STRUCK DIGGINGS.—Plumas *National*, March 23: Some new surface diggings have heen discovered near the Indian Valley mine, near Greenville, which prospect well and will prohably prove extensive.

RICH YIELD.—Compton's mill is paying splendidly, and the ledge looking hetter than ever. On Saturday last, after a 2 day's run with 6 stamps, 52 ozs. was cleaned up from the apron and screens with fnlly as much more in the battery.

SAN DIEGO COUNTY.

SHIPPED.—San Diego *Union*, March 21: Bullion amounting to $2,280 was shipped to S. F. on the Orizaha yesterday.

ITEMS.—At Julian general activity prevails. All of the mills are running, and nearly every ledge is being worked, some quite extensively.

At Banner, Whitney & Co,s mill has temporarily stopped. Work will he commenced on a more extended scale in a short time.

The Stonewall are puehing work with vigor. Since water was struck in the shaft, the mill has been rnnning steadily night aud day. A recent clean up of float and other rock made a good showing.

The De Frees mill cleaned up 2 or 3 days since 48 tons of ore from the Mabel, which yielded $48 per ton.

The Reynolds mill has crushed 20 tous of ore from the Big Blue lead, which gave $53 per ton.

The prop. of the Owens lead are running a level at the depth of 200 ft. The ore in sight will go ahout $19 per ton. There is sufficient ore to keep a hundred stamps husy, if the mine is properly worked.

The Helvetia is being worked steadily at present. Its owners are taking cut a lot of ore which will ho crushed at the mill of De Frees & Co.

The Excelsior lead has a day and night force at work.

The Antelope mill is busy at work upou Madden rock, aud has several engagements to crush for other Companies.

Wilson & Co. are crushing Helvetia rock. The working of the new mill gives goueral satisfaction.

Work has been resumed on the Washington lead, which has recently heen leased.

SIERRA COUNTY.

Downieville Mt. *Messenger*, March 23: WORKING SULPHURETS.—The Indepcndence mine will erect works for the reduction of sulphurets this spring; also put in heavier machinery, and put their mine on a first class footing.

ALL OUT.—Manson has got the Highland & Masonic mine, at Alleghany, clear of water, and will push the work to hring to light the pay dirt.

DISCOVERIES.—A numher of discoveries of rich quartz have heen made in this vicinity during the past winter, the most important of which, perhaps, is the High Commission ledge on the south Fork. The owners have gone in about 100 ft. and have a ledge from 10 to 12 ft. wide, the rock throughout heing rich in free gold. The most important feature of this mine, is a helt of black sulphurets from 18 inches to 2 ft. wide, assaying from $5,000 to $6,000 per ton. Similar sulphurets have been discovered on the East Fork and in Jim Crow Cañon.

SOLANO COUNTY.

SHIPMENT.—Vallejo *Chronicle*, March 30: Eighteen flasks of quicksilver were brought in from the Vallejo mine to-day for shipment.

TRINITY COUNTY.

RED HILL.—Weavorville *Journal*, March 23: The miners of Red Hill and vicinity are working like hees, and will make a good season's run.

LEWISTON.—Olney Philips is working 8 or 10 men in his claim. Trask & Ross are helieved to have struck excellent pay.

GOOD DIGGINGS.—Ward's claim, on Oregon Gulch mountain, is the largest and perhaps the richest in Trinity Co. The face of the claim at present is 600 ft. in length and from 40 to 60 ft in depth. The gravel is intermixed with dscomposed quartz and volcanic ashes, which readily yield to the action of the water without using either pick or hydraulic.

Nevada.

EUREKA DISTRICT.

BULLION.—Eureka *Sentinel*, March 29: The Consolidatsd shipped 110 tons of hullion yesterday and day hefore. The Co. has produced so far in the present month, with hut 2 furnaces in operation, 290 tons.

PROGRESSING.—Work on the Richmond furnaces is progressing rapidly.

THE MINES.—We yesterday visited soveral very valuahle propsrties on Adams Hill. The first in order was the Newport, which hclongs to the Magnolia Co. Ths main shaft is down ahout 100 ft. disclosing a hody of ore 12 ft. in width. Three men are sinking preparatory to opening up levels. An extra force will he put on the Astor incline to-day where large quantities of high grade ores are visihle. There are ah out 150 tons of ore on the varions dumps. Passing on to the Meredith, on which a shaft is down 20 ft.; we saw a fair showing of ore at the hottom. Crossing over the ridge still further west hrought us to the Adams Hill property, which is heing vigorously worked. Three shifts of men are working night and day in the tunnel level. The most gratifying success attends all these various operatious, fine high grade ore being met with at all points.

SPRUCE MT.—The principal mines of the Ingot Co., are the Latham and the Fourth of July. The I. Co. ie erecting a large furnace, which will soon he ready for active operations. Thero are ahout 140 men in the Dist.

ELY DISTRICT.

BULLION.—Ely *Record*, March 21: W. F. & Co. has shipped since the 14th inst., hullion valued at $96,794.92.

KINGSTON.—The mine ie on Panaca Flat. It has a shaft 165 ft. deep, and is being worked vigorously, the ledge showing itself at the depth of 150 ft., and is looking fiuely.

PIOCHE (No. 9).—Tho shaft is in 460 ft. The first station is 75 ft. from the eurface. A drift has hcen run 170 ft. showing a fins hody of ore. At the second station is another drift of 300 ft. with an immenss hody of ore. At the fourth station 360 ft. from the surface, is a drift of 294 ft. The ore in this drift is completely covered with horn silver, and averages by assay $1,000 to the ton. At the bottom 460 ft. from ths surface, there is a drift or "cross cut" hsing run to tap the ledge. It is only in ahout 12 ft. as yet.

HUMBOLDT.

THE FRENCH CANAL.—Unionville *Silver State*, March 30: J. Ginacca has purchased a 10-stamp mill, all complete, which he intends putting up along side the old French Canal, at Winnemucca.

SEMINOLE TUNNELING Co.—The working force on the Scminole has heen increased. The ledge continues to improve as depth is attaiued. The ledge is 4 ft. wide and the ore is of excellent quality.

ECLIPSE.—The owners this week commenced stoping, and are now extracting rich ore in large quantities. The vein matter is from 5 to 6 ft. wide, one-half of which is miueral-bearing quartz.

REESE RIVER.

WHITLATCH UNION. — Reese River *Reveille*, March 27: This mine is in splendid condition. A large ledge of high grads ore is heing worked on steadily.

YANKEE BLADE.—The mines of this Dist. are yielding high grade ore, and preparations are heing made to work them mors extensively than heretofore. Mines long abandoned are heing reopened, the "Confidence" among others.

WASHOE.

ORE YIELD.—Virginia *Enterprise*, March 23: Last week the Crown Point yielded 2,95J tons of ore, the Savage 1,173 tons, the Chollar 758 tons, and the Hale & Norcross 760 tons.

PUMP IN OPERATION.—The Justis Co. have got their pump in operation and are fast lowering the water in the mine.

SUTRO TUNNEL.—Tho tunnel was yesterday in 2,800 ft.

ARIZONA AND UTAH—The Co. sitnated upon the same lead as the Globe Co., hslow Gold Hill, have cleaned out their old tunnel and retimhered it in good shape.

THE Hale and Norcross Co. are eteadily drifting south on their lower level.

BULLION.—We yesterday saw at the California Bank silver bricks to the value of $43,245.90, from the Crown Point and Belcher mines.

SAVAGE.—Night before last connection was made hetween the south drift, on the

1,400 ft. level of the Savage, and the winze going down from the 1,000-ft. level. This gives a fine circulation of air. The incline has been completed to the 1,500-ft. level, a station opened and drifting commenced.

GLOBE MINE.—A considerable number of workmen are taking out ore from the croppings, and in opening the old tunnels and inclines. Their lower tunnel, being cleaned out and retimbered, is from 1,300 to 1,400 ft. in length. They have cleaned out and substantially retimbered this tunnel 400 ft. and are pushing the work ahead. The tunnel taps the vein 700 ft. below the croppings. Above this tunnel is a second one about 400 ft. in length. This strikes the lead, and runs along it 200 ft.

YIELD.—Gold Hill *News*, March 27: The last weekly reports of 3 of our mines show the following results: Chollar-Potosi, 950 tons ore extracted, assaying $37.54 per ton, and $25,386 shipped; Crown Point, 2,858 tons of ore, sent to mills, estimated at $159,717; Savage, 1,660 tons ore extracted, averaging $27.20 per ton.

LEWISTON MINE.—The mine is 300 ft. west of the Buckeye, and is a recent discovery. The ledge averages about 7 ft. in width. A shaft has been sunk 20 ft., and the ore averages about $100 to the ton.

DANEY.—The main shaft is being sunk for the 600-ft. level, and is already 20 ft. below the 500-ft. level, with plenty of water to contend with, yet good progress is made. At the 500-ft. level a drift is being run north; following the ledge, with promising indications.

WHITE PINE.

BULLION.—White Pine *News*, W. F. & Co. shipped from this city, to-day, to London, for Eberhardt & Anrora M. Co. (limited), 4 bars, 286 lbs., valued at $5,339.23.

WILL START UP.—The furnace at Robinson Dist. will be running on base ore in a few days.

EBERHARDT & AURORA CO.'S MINES.—In company with Joseph Potts, the Assistant Supt., we examined this week the works of the Co., on Treasure Hill. The Earle mine was passed through to the Lady's chamber. As far as opened the Lady's chamber is 42 ft. wide, 100 in length, and 50 ft. high. On the south end there was a fault (or slip) that cut off the ore. A drift was started in a southeasterly course. After running 130 ft., a large body of ore was found in the south chamber, that as yet has no limit. The opening is 35 ft. high, 40 ft. wide, and 125 ft. long. In the bottom and sides of the opening, rich ore is in sight. In the bottom of the chamber the ore goes down below the level of the tunnel, of regular grade. The ore-body in the Risdale chamber is not as extensive as far as opened as in the south chamber; but is of a more regular grade, and mills from 100 to 220 per ton. Fifty tons of this class of ore is extracted daily.

Arizona.

YAVAPAI CO.—Prescott *Miner*, March 16: The Tiger is "panning out" plenty of ore, some 20 tons of which were shipped this week. The placer miners are taking out considerable gold. Vulture mill, at Wickenburg, is still running.

PIMA CO.—I. Q. Dickason brought some rich specimens of silver ore from a mine near Tucson.

MARICOPA CO.—Work is progressing on the Silver Queen and other lodes.

MOHAVE CO.—In Wallapai dist. An immensely large mine—supposed to be the one formerly worked by the Jesuits, has been discovered. Its location is not far from Mineral Park.

ITEMS.—The Tiger tunnel is in 216 ft. from the bottom of the deepest shaft, and a cut—to find ont the width of the vein—has been started.

MINERAL PARK.—Cor. Los Angeles *News* March 23: Great excitement is occasioned here by the reported discovery of the Montezuma mine in this neighborhood.

Twenty men are about leaving for the new placer diggings on the Colorado. From $10 to $15 is reported as the average pay per man per day. The locality is known as Black Canon, and is about 100 miles above Stone's ferry.

Mr. Elder, of Inyo county, is here and inquiring into the expediency of erecting smelting works in this vicinity.

ORES.—San Bernardino *Guardian*, March 26 Bruun & Roe received this week for shipment to San Francisco 47 sacks containing 3,700 pounds of silver ore from the claims of Capt. St. Dennis, Ivanpah, also 50 sacks of 4,495 pounds from Hite & Chatfield. The last lot forwarded to San Francisco sold for $1,362 per ton. This will undoubtedly go as high as $1,800.

CLARK DIST.—The crude bullion from the following mines sold in S. F. as follows per ton: Beatrice No. 2, $1,064; Beatrice No. 1, $433.09; Snow Storm, $529.04; Hurst & Co., $1,463.88; Lizzie Bullock, $1,362.04; Monitor $909; P No. 1, $675; P No 2, $430.

Colorado.

ITEMS.—Colorado *Miner*, March 21: The ore blockade is immense. Baily & Nott have shipped on account of owners, during the past 2 weeks, 30 tons of very rich smelting ore They have on hand, sacked and ready for shipment, 150 tons. There was crushed, sacked and sampled, at the mill of the Snowdrift S. M. and R. Co., during Feb. 76,929 pounds of high grade ore. There was crushed, sacked and sampled, at Hall's crushing works 182,000 pounds of ore. Burgharut and Wyth are working on a contract on the Eclipse tunnel, Grillith. The tunnel has been driven in about 500 ft. The Killwinning lode, Republican Mt., is yielding first class ore worth 1,315 ozs per ton. The second class worth 400 ozs. The Cliff mine is in a good body of fine ore and is improving as work progresses. An average of ore assayed yielded 903 ozs. per ton.

CLEAR CREEK Company will soon have smelting works.

POLLOCK DIST.—Cor. same: Kings lode is looking splendidly—Bemroso, if he can rent the Gould Hoyt mill, will run it next summer. The Pacific and Oro Fino lodes, on Ten Mile, have been sold and will be worked this season. Dowd, Breece and some Boston boys will construct a ditch from Snake river to New York and Soda Gulches at an early day. Fahey & Co., are constructing a ditch from the Ten Mile to Salt Lick Gulch. Greenleaf & Co. have been all winter getting out lumber for the Georgia Gulch flume.

MIDDLE BOULDER.—Central *Register*, March 20: The Caribou mill is in successful operation. About 18 tons of ore are worked daily, which yields from 100 to 200 ounces of silver to the ton.

Yesterday we visited the Belmont and Chomung lodes, and were surprised to see the activity in mining matters.

The first shaft we visited (No. 2 east on the Chemung) at 18 ft. has a crevice of very fine ore a foot in width, that is yielding 8 ounces per cord, under stamps. The mines are Ewers & Co.

On claim No 2 west, on the Chomung, Mr. Compton is taking out a very fair grade of ore. Adjoining this on the west, Leahy & Co. are working with profitable results.

East of Ewers & Co. about 606 ft. Flint & Co. are working, to considerable profit, the Belmont lode.

Idaho.

LOCAL RECORD.—Silver City *Avalanche*, March 23: The winze from the bottom of the 8th level of the Golden Chariot is yielding fine looking ore. Stoping is going on in the 4th level of the War Eagle, both north and south of the shaft. The vein is from 18 inches to 4 ft in width pay ore. The steam hoisting works formerly used at the Poorman were taken to the Minnesota this week and will probably be started up today. E. A. Thompson is working the Idlewild and taking ont ore, in much of which gold and silver are plainly visible. Sands & Co. are taking richer ore than ever from the Illinois Central. A fine body of pay ore has been struck in the north Oro Fino. The Empire is not being very extensively worked at present, although the ore continues rich. A permanent shaft will soon be commenced, with a view of putting hoisting works on the mine. Charley Peck is still driving his tunnel on the Belle Peck mine. He is in about 130 ft. The Mahogany fourth level continues yielding an abundance of splendid ore. The ledge continues looking well in the Ida Elmore winze north, and also in the 7th level drift of that mine.

SOUTH MT.—Cor. same: Mr. Brunzell intends to commence operations on the Scanda in a few days. Hastings & Co. have good indications in their tunnel: Cut 30 ft., tunnel 84 ft., width 7½ ft., hight 8 ft., depth from the surface 44 ft. and timbered the whole length. Work is going on in the Polar Star tunnel, with no indication of ore as yet. Length of cut 14 ft., tunnel 36 ft. and depth from surface, 20 ft.

Montana.

MILL RUNNING.—Deer Lodge *Independent*, March 23: The St. Louis mill at Phillipsburg was started up last week and is running successfully.

ROCKER.—The miners are busily engaged in preparing for spring work. The Rock Creek Ditch Co., intend to commence cleaning ont their ditch Monday next.

BLACKFOOT MINE.—Cor. same: There has been but little mining done during the past winter in Ophir gulch and bar.

The Illinois gulch is known to be rich and extensive. The different Co.'s have their work in a state of forwardness and their claims in perfect order.

On Carpenters' bar mining will be resumed about the 1st of May. But little preliminary work will be required, as the Cos. have their claims in working order.

NORTH PACIFIC LODE.—Helena *Gazette*, March 18: The prospects of finding a good vein are very fair.

RADERSBURG.—On Left-Hand lode, Clancey & Hull are opening their mine in a systematic manner. They have contracted for the removal of the Blue Cloud mill from this county, and its erection at a convenient point below Keatingville.

Mining on the Allen lode is steadily progressing, and all the things are in readiness to commence hoisting. The Allen mill, a 6-stamp, is crushing this ore very successfully. The Davis mill will also commence crushing on ore from this mine in a few days.

Several very promising mines of rich argentiferous galena, have been discovered in this dist. and will be developed during the coming season. Some discoveries of silver chloride have also been made which promise well.

Lower California.

ITEMS.—San Diego *Union*, March 21: The engine and boiler to be used by McKean to run the 10 stamp mill, arrived. Mr. McKean has several tons of rockready, and intends to commence crushing at it once. The Zapata mine will be worked extensively in a short time. Considerable prospecting is being done.

Utah.

OPHIR.—S. L. *Tribune*, March 26: The late shipment from the Pioneer mills to Walker Bros., was $5,870,11.

We were shown yesterday a valuable specimen of ore from the Silver Exchange mine weighing 90 lbs. A considerable amount of this ore has been worked, the first-class yielding $183 and the 2d $157 to the ton.

In Dry Cañon (correspondence) the miners are pushing their tunnels and shafts vigorously. Near the mouth of the cañon are the Rip Van Winkle, Nabob and several other mines on which much work has been done. The most promising mines on "Shoo Fly" hill are the Kearsage, Alabama, Post Boy, Noonday, etc. After leaving Shoo Fly Hill we passed down to the Mo-No, Converse, Utah Queen, Caddit, Miami, and thence to the Snow Storm Tunnel, which gives much promise but the development is yet limited. Below this tunnel the Lillie of the West shows rich ore. The first mines noticeable as you passs into East Cañon are in close proximity to the Brevoort Mill, Green Chloride Hill. Of these I visited the Red Jacket, Lexington, Green Chloride, Black Hawk, Irene, Malakoff and others, all of which show large bodies of ore and give great promise. On Silver Shield Hill on the edge of the cliff is the Oriental Tunnel and the Cliff Mine, from which they take exeellent ore from a good-sized ledge. Above this mine is the Champion, near which are the Miners' Delight, Silver Shield and Velocipede Nos. 1 and 2. Next we come to Ophir Hill, on which are the Burnett, Severe, Wild Delirium, Grant Tunnel, Chloride, Fair View, Bath, McCollum and Silvertail. The Fair View has a shaft of 100 ft. and the Silvertail is making a first-class exhibit of ore.

S. F. Stock Exchange Board.

SAN FRANCISCO, April 4, 1872.

The sales at the Board for the week ending Wednesday, the 27th ult., amounted to $4,-015,000, March receipts of the Meadow Valley mine were $150,000. Last week 1,985 tons of ore were taken from the Crown Point mine, valued at $124,981 and 956 tons from the Chollar-Potosi, assaying $36.48 per ton. The last bullion shipment for the latter was $17,652. The March receipts of the Raymond & Ely mine aggregated $319,953. Over 1,500 tons of ore were taken from the Savage last week assaying $34 per ton. The first shipment from the Raymond & Ely this month amounted to $31,100. On Friday mining stocks were in good demand in the Board; on Saturday only moderately active; Monday in good demand; Tuesday again strong; Wednesday active and in good demand, and to-day the markot is still excited and most kinds of stocks are tending upward.

STRAWBERRIES.—Ten days ago strawberries were bringing one dollar per pound at retail; now they are abundant in all the markets of the city at from 20 cents to 25 cents per pound. There is every prospect of abundant yield the present spring and summer, and prices will undoubtedly rule low. We hear of no blight, bugs or insects affecting the vines; but owing to the unusually wet spring, the berries though large, are not up to the full standard of sweetness.

MINERS and mechanics write for your paper.

The Hot Springs and Geysers of Montana.

In the February *Journal of Science* appears a description by Prof. T. V. Hayden of the hot springs and geysers of the Yellowstone and Firehole rivers of Montana. That wonderful region, until recently entirely unknown to the outside world, is now attracting wide attention to its natural curiosities, its scenery, its phenomena of artistic, scientific and medical interest.

Almost the whole area of the Yellowstone Basin is covered with volcanic material in some form. The basis rocks on the usual metamorphic granitoid series of the country, with every variety of basalts and basaltic conglomerates. The sedimentary rocks are Carboniferous, Jurassic, Cretaceous and Tertiary. It is doubtful whether any unchanged rocks older than the Carboniferous occur. The Triassic is probably wanting. There is evidence that the sedimentary rocks covered all the country up to the Eocene Tertiary inclusive.

Warm springs are not uncommon in the valley of the Lower Yellowstone, but seldom over 80° in temperature. At Gardiner's river, a branch on the west side, they commence in full force. About 3 miles above the junction the valley bottom is covered with a thick calcareous crust, the deposit of springs now extinct, under which flows a stream of hot water, of 132°, 6 feet wide and 2 feet deep. A little distance up is a group of four placid springs, 6 to 10 feet in diameter, whose curative effects were loudly praised by a number of invalids residing there.

A Wonderful Hill.

Near this spring is a high hill on whose slope is a system of terraces, each from 200 to 300 feet high, covered with a thick deposit of lime. The surface of the first two is fast decomposing, and the springs are nearly extinct. Higher up occurs a hot spring deposit, wonderful even in this land of wonders, in the distance appearing like a vast glacier. Indeed the different terraces in beauty can be compared only to a frozen cascade. First comes a broad terrace with old chimneys, irregular openings, like entrances to caverns, which extend beneath the crust, here probably from 20 to 50 feet deep. A little further up are basin-like pools, 4 to 8 feet in diameter and 1 to 4 feet deep, with semi-circular rims most beautifully scalloped; and underneath these rims are rows of stalactites with every variety of surface ornamentation. These continue about fifty yards, gradually ascending, and then occurs an abrupt declivity of about a hundred and fifty feet, rising in steps formed of these exquisitely moulded pools, of every size and variety. Upon the terrace above are numerous active springs with basins 20 to 50 feet in diameter, and with water heated to 150° or 160°, which, however, flowing down the declivity from one beautiful pool to another, gradually loses some of its heat; and we may find a bathing pool of any desired temperature.

Upon this lower terrace springs are continually dying out and others are breaking out anew. There are also several extinct geysers. One has a circular deposit of carbonate of lime, 50 feet high and 25 feet in diameter at the base, looking in the distance somewhat like a conical column. The layers of deposit are arranged on the almost vertical sides of the cone like the straw on a thatched roof, or hay on a stack.

Upon this terrace the principal portion of the active springs is now located; and here is presented another picture to the eye which transcends any description in words. The water is wonderfully transparent; one sees with perfect distinctness through it the minuted ornament on the inner sides of the basin, and the exquisite beauty of the coloring, and the variety of forms baffle any attempt to portray them with pen or pencil. Then, too, around the borders of springs, especially those of rather low temperature, and on the sides and bottoms of the numerous little channels of the streams flowing from these springs, there is a striking variety of the most vivid colors, comparable only to our most brilliant aniline dyes; various shades of red, from the most brilliant scarlet to light purple; yellow, from deep bright sulphur to light cream color; then also various shades of green. All these colors are rendered very vivid by the water. The springs are also full of a kind of vegetation, composed of diatoms; and in quiet springs and little streams from boiling springs there are great quantities of a fibrous silky substance which vibrates at the slightest movement of the water, and has the appearance of the finest cashmere wool.

About 300 feet further up the mountain are other localities, where the springs, however, are nearly extinct, and the surface covered with the remains of a still nobler natural architecture. A few small springs throw up jets of water two to four feet high. The orifices are lined with a light cream-yellow mixture of lime and sulphur. There are also chimneys, with walls 4 to 10 feet high, some nearly circular at the base, lined inside with a coating of carbonate of lime which is hard, smooth and like porcelain in luster. The oblong mounds, from a few feet to a hundred yards long, 10 to 20 feet high and 15 to 20 feet around the base, generally have a fissure along the summit, in some of which the water can be heard seething and boiling. These fissures all have the same beautiful white porcelain lining, and in some the brilliancy is intensified by the precipitation of vivid yellow sulphur in acicular crystals, but so delicate that they disappear at the touch. A qualitative analysis shows that the spring water contains sulphuretted hydrogen, lime, soda, alumina and a little magnesia. Carbonate of lime predominates, and they may therefore be called calcareous springs.

Classes of Springs—Their Age.

There are two classes of springs in the Yellowstone valley, one in which lime predominates, the other, silica. With the exception of those mentioned and one or two of lesser importance, most of the springs of the Yellowstone and Firebole Basins are siliceous. They may again be divided into intermittent, boiling and spouting, and quiet springs. The first are always above the boiling point when in action, but during the interval the temperature lowers to 150°. The second are always at the boiling point, and some of them throw the water up 2 to 6 feet by regular pulsations. The third class may once have been geysers, but are are now quiet, and range from 188° to 90°. When the temperature is below 150° great quantities of iron sesquioxide are deposited by the water.

An interesting question is that in regard to the time required for the deposition of this material. The position of the active springs is continually changing. In the aggregate they have been in constant operation during our present period. The center of activity may have removed and returned to its present position several times. There are no data to estimate at all accurately the period of any one era of deposition. Around the springs now active are dead pines, 6 to 18 inches in diameter, buried 4 to 6 feet in the calcareous deposit. From evidence gathered, one may estimate that at least 6 feet have been deposited within the space of one century.

Another interesting feature is the antiquity and great compactness of some of these deposits. On the mountain summits 1,500 to 2,000 feet above the river, evidently lifted by the forces which elevated the whole range, is a bed of hard, white and yellowish-white, regularly stratified limestone, 50 to 150 feet thick, which once evidently extended over a large portion of the valley. We may ask the question whether the geological structure of this region has anything to do with the calcareous character of this deposit. On the side of Gardiner's river, opposite the hot springs, is a bluff extending 6 miles, composed in the aggregate of 1,500 feet of Upper Cretaceous and Eocene Tertiary Strata, with some irregular intercalated bed of basalt. A thick bed upon the summit rests uncomfortably on the Tertiary beds. This group of strata inclines northeast at a moderate angle, and undoubtedly extended across the river over the area now occupied by the hot springs. Under the hot spring deposit, beds of older date incline in the same direction, the angle increasing as we ascend the mountains. The whole mountain side is covered with basalt of a thick deposit of local detritus, with here and there an outcrop of arenaceous Jurassic limestones. We therefore know that beneath this calcareous deposit there are at least 1,500 feet of Carboniferous limestones. If the origin of the heat which so elevates the temperature of these spring waters is as deep seated as is generally supposed, then the heated waters have ample play for their powers in dissolving the calcareous rocks beneath.

Hot Springs of the Upper Basin.

A few springs occur at the mouth of Tower creek, at the lower end of the Grand cañon, but the great hot spring district commences beyond the mountain range forming the north wall of the upper basin, 20 miles above the Lake. Here is an area, 40 miles long and 15 wide, which either is or has been occupied by hot springs. The Grand cañon is a channel 1,000 to 1,500 feet deep, carved out of basaltic rocks and hot spring deposits, on the sides of whose walls may be seen the irregular fissures which communicate from the surface with the heated interior. Resting upon an irregular surface of basalt are immense deposits of silica of every shade of red, yellow and white.

On Mt. Washburn is a remarkable group of springs now in constant action. Alum, sulphur, soda and common salt are found upon the surface in considerable quantities. Sulphuretted hydrogen is emitted in such amounts as to fill the air and render it oppressive. This group extends across the Yellowstone to the eastward for several miles. The springs now in action are only a few out of the many hundreds which once covered the entire area.

Sulphur and Mud Springs.

The largest group of these is at Crater Hills, 8 miles below the lake, in a district about half a mile square. Here are several mounds, 50 to 150 feet high, of siliceous deposits from extinct springs. The old craters and immense deposits show that the present active springs represent only the last stages of a once magnificent group. Even those now remaining excite intense astonishment. All around the base and high up on the sides of the hill are vents from which steam constantly issues, and around the edges and inside the orifices a most brilliant yellow layer of sulphur has been precipitated. On the west side, one of these jets produces a sound like that of a locomotive, which can be heard for a long distance. The surface is fairly riddled with little steam vents, and the crust seuds forth a hollow sound beneath the tread; and on removing this shelly covering at any point, hot vapors come forth, while its inner surface is encrusted with beautiful sulphur crystals. The springs here are either boiling, mud, or quiet springs. The principal boiling spring is near the base of the hills, and is in a constant state of violent ebullition sending up a colum of water 2 to 4 feet. It has a basin about 15 feet in diameter and gives forth a huge column of steam. The rim of this spring is a marvel of beauty. It is composed of silica, but scalloped and covered over with the most delicate head-work, and upon the pure white silica is deposited a thin layer of sulphur of the most delicate cream color.

Perhaps the most interesting objects here are the mud springs, which are of every size from 1 inch to 20 feet in diameter. One of the largest is filled with fine light-brown mud which is in constant agitation, its surface covered all over with puffs like basty pudding. Others send forth a thud-like noise every second, with an impulse at longer intervals which throws the mud up several feet. The water and mud in the vicinity are thoroughly impregnated with alum.

Two miles above is another group of boiling, turbid, placid, or mud springs and geysers. Upon the side of the hill bordering the river is a most terrific mud cauldron. A large column of steam is constantly ascending, 500 feet or more, from a deep funnel-shaped basin, 25 feet in diameter; when the wind carries away the steam for a moment, the thin black mud may be seen boiling violently about 20 feet below the rim, with a noise like distant thunder. The ground and trees for 200 feet around were covered with the mud which had been ejected at some of its periodical outbursts.

Checkmating the Cats.—A writer in the *English Mechanic* exults greatly on account of the success of a device put into practice by him for preventing cats from coming over the fence into his yard. This consists in nailing down horizontally along the top of the fence a piece of wire gauze or netting, having a coarse mesh, and projecting about two feet on each side. The netting will bend slightly downward by its own weight, and while it does not exclude the light or rain from the garden, will resist the most persevering efforts of any cat to surmount it.

The iron exports of Great Britain to the United States in 1871 amounted to nearly $38,000,000 in value, being more than one-half the iron exportations. This statement does not include the hardware trade, which foots up near $2,500,000.

About one person in fifty is said to have good luck in the South African diamond fields.

The Use of Sewage for Irrigation.

The city of Berlin, Prussia, has for a long time been considering the various methods of removing its refuse, etc., with a view to introducing the best process. Among other things it tried some experiments in utilizing the sewage for irrigation, and we propose to use freely Prof. Dunkelberg's article written on this subject for the Cologne *Zeitung*, as being of considerable interest both to people within and to those without the precincts of a city.

We omit the discussion of the question as to whether or no it is best to lead the matter from water-closets and other receptacles of human excrement into sewers. Many suppose that sewage without these excrements is worthless for agricultural purposes. That this supposition is wrong, is shown by V. Liebig's report to the Lord Mayor of London, in 1859. The analysis of water in which fish and certain vegetables (potatoes, cabbage and cauliflowers) had been cooked showed that in 472,768 tons of this water there were contained 414 tons of potash and 125 tons of phosphoric acid. If we take into consideration the immense amount of valuable matter sure to find its way into the sewers of large cities, we can see that by letting the sewage run away unutilized, whether or no the human excrements be carried off with it, there is a tremendous loss to agriculture. In the Berlin experiments the water from the sewer of the Königgrätz street was used to irrigate a sandy waste of about 4 acres. Part of this area was devoted to strawberries and other kitchen vegetables of various kinds and part was sown with grass. On the part devoted to grass it was necessary first to sow winter rye in order that the ground might be bound together; otherwise the water would have washed away grass, seed and sand together. The experimental irrigation was commenced on July 24th 1870, but was interrupted from October 2d to November 13th, and was continued for 81 working days of 20.3 hours (on the average) each, or 1642 hours. In this time about 1,436,000 cubic feet of water were used, equal to about 1½ inches (in hight) per day.

The sewer water was of excellent quality and the rye grew luxuriantly, so much so, in fact, that although cut twice and in places three times, it prevented the growth of the grass, the seed of which was mixed with the rye. Hence no grass crop was obtained in 1870, and the winter irrigation had to be tried on rye land, which was less adapted therefor than is grass land. There was no help for this, one of the main objects of the experiment being to see whether winter irrigation was feasible in the climate of Berlin.

On the 1st of December, 1870, the irrigation was recommenced and carried on for 102 days at the rate of 2.165 inches (in hight) per day. The result showed the feasibility of the plan, for notwithstanding the severity of the winter [unfortunately no data concerning the temperature are given] the ground was never frozen, and even where ice formed on its surface, the irrigation water flowed regularly beneath the ice and prevented the ground from freezing. For the sewer-water, on account of its formation and underground flow, can not get below the freezing point, and always showed at least one degree above the freezing point. The amount of this water obtainable for the experiments was very limited, and a large amount would have had a higher temperature. On account of an overflow from the Spree canal the pumping machinery was submerged and the irrigation stopped on the 15th of March for a considerable period.

The appearance of the field in March and April was not all that could be wished. In the upper part, which had received the most water, there were spots where the rye had been killed; between these places, however, individual bunches of (timothy) grass were in full growth. In other parts the rye had survived. The ground was then sown with grass seed (about 24 lbs. to the acre) and lightly harrowed with iron rakes.

In spite of the cold, unfavorable spring the young grass grew well and that sown the preceeding year spread and flourished so luxuriantly that a crop of 8,280 lbs. were obtained from 2½ acres early in May. A second crop of 7,259 lbs. was obtained in June 2d to 11th. Both of these crops came from the seed sown the previous autumn, proof enough that the winter irrigation had not destroyed all vegetation as very many had predicted it would. On the 25th day of June the third crop of grass was 18 inches high, the strawberry vines bore ripe fruit and the salad had been harvested and a crop of celery planted in its place.

To this may be added that a report of the 25th of August showed that the irrigated land had produced nearly 57 tons of grass in three crops while a fourth crop, only partially cut, had given 10½ tons more; that the strawberries (not including the many given away) had produced to the value of over $2¼; the salad per square rutho (about 153 sq. ft.) about 75 cts.; peas, 60 cts.; cauliflower, $3¼; beans, 34 cts.; varieties of cabbage from 25 cts. to 50 cts.; another variety of bean, not yet fully gathered, 90 cts.; and that the part of the field harvested had been sown with another crop. The maize (a variety called "Giant maize" in Germany) had grown to the hight of 9 feet. Table beets were in fine condition and sugar beets had a circumference of 21 inches.

Taking into consideration the many disadvantages encountered in the experiments, the results must be admitted to be very strong evidence in favor of the utilization of irrigation, both winter and summer, by sewage.

Useful Information.

Utilizing Insects in India.—Wallace in his "Malay Archipelago" gives the following account of the manner in which the superabundance of insect life is turned to account in the islands of the Malay Archipelago. Writing of Lombock, an island at the east end of Java, he says:—Every day boys were to be seen walking along the roads and by the hedges and ditches catching dragon flies with bird-lime. They carry a slender stick, with a few twigs at the end, well anointed so that the least touch captures the insect, whose wings are removed before it is dropped into the basket.

The dragon flies are so abundant at the time of the rice flowering, that thousands are soon caught in this way. The bodies are fried in oil with onions and preserved shrimps or sometimes alone, and are considered a great delicacy.

In Borneo and Celebes, the larvae of bees and wasps are eaten either alive as pulled out of their cells or fried like the dragon flies.

In the Moluccas islands the grubs of the Palm beetles (Calandra) are regularly brought to market in bamboos and sold for food; and many of the great Lamellicorn beetles are slightly roasted on the embers and eaten whenever met with.

Oiling and Blacking Harness.—All harness that is in constant use should be washed, oiled and blacked at least twice a year. When it is to be oiled, unbuckle all the parts and wash the surface clean with strong soapsuds. Any coating of gum which the soapsuds will not remove, may be removed by a little turpentine or benzine. Then warm the leather through and through. As soon as it is dry on the surface, and before it is dry to the center, apply the oil. Neat's-foot oil is the best. Linseed oil will make the harness dry and stiff. Apply the oil with a paint brush or swab, the harness lying on a bench or smooth board. The small pieces may be dipped in a pan of oil and drawn out slowly between the thumb and fingers to wipe off the excess of the fluid. By using a large pan one can oil a harness in a few moments neatly and thoroughly, and without wasting any oil. As soon as the oil has dried in, a coat of leather varnish should be applied. *Industrial Monthly.*

What is Fermentation?—It is asserted by Miss Coleman and "Beechwood" that fermentation is "rottenness," "death." On the contrary, it is life, literally and philosophically speaking. It is the progenitor of all life from the germination of the smallest seed to the hatching of the largest egg. Without it no life could begin, no life could continue. It is thus described in *Wood's Botany*:—"When a seed is planted in moist soil at a moderate temperature, the integuments gradually absorb water, soften and expand. The water is decomposed, its oxygen combines with the carbon of the starch stored up in the tissues, carbonic acid is evolved, and the starch is converted into sugar for the nourishment of the embryo, which now begins to dilate and develop its parts," and life begins.

Fermentation is a changing of the materials of organism for the creation of new ones for the purpose of nourishing life. It is not rottenness; neither is it death; but if properly arrested, may endure for ages, as in the case of "old wine."

Safety-Matches.—Casualties are continually occurring from fires caused by ignition from the still burning ends of lighted matches thrown carelessly aside; and it may be of interest to learn that a mode of preparation has lately been devised by which such a result may be entirely prevented. The principle of the new match consists in impregnating the wood of which it is made with a chemical solution which prevents the carbon from remaining a fiery mass for a single instant, as in the case of ordinary matches, so that as soon as it is blown out it may be thrown with perfect safety upon inflammable or explosive substances. The manufacture is said to be no more expensive than those now in use.

Mounting Drawing Paper.—First moisten the paper thoroughly; then lay it upon the board in proper position and with blotting paper remove most of the moisture for a distance of about one-half inch from the edges; then take strips of Manila paper (not too stiff), about 1⅛ inches wide, covered on one side with mucilage, and paste them down on both paper and board, allowing them to lap on the edges of the sheet about half an inch. Keep the middle of the sheet thoroughly wet until the mucilage has set, when the whole sheet may be allowed to dry gradually. This method is quick, sure and of especial use when coloring is necessary.—*Industrial Monthly.*

Snoring.—Snoring is, of all bad habits, the most intolerable, and it is comforting to know that a device has been found out to mitigate its horrors. A long and flexible tube leads from the nose of the patient to his ear, and thus the undulcet sounds which he creates awakes the author. He, in effect, consumes his own snoring, much as a well-constructed factory chimney consumes its own smoke; and, being thus convinced of the enormity of his own sin, learns to repent him and keep his own nose under better control.

The number of miles of railroad now in operation in the United States is 60,382.

Hints to Manufacturers.—The most important rule for a workshop is "a place for everything, and everything in its place;" and its rigid enforcement will save hours in time, and dollars in money, every week. Keep your floors and benches clean, and force journeymen and apprentices to take some degree of pride in the appearance of the benches and parts of the floors they occupy. It is not difficult to get a good workman interested in such matters; and the best workman, if he be a reliable man, is the cheapest under every circumstance. "Cheap help" waste and destroy as much as they earn, and the result of their labors is seldom satisfactory. We could never understand why a manufacturer, who could not think of touching his cash-drawer without the knowledge of his book-keeper, should deem it proper to walk into his factory and give his journeymen instructions regarding their work without first informing his foreman of his intention to do so. A competent foreman is naturally sensitive of his perogatives; an incompetent one you do not anticipate employing. If you engage a foreman, give him entire charge and control; if not, engage an assistant foreman and be foreman yourself, taking the responsibility as well as the credit of so being.—*Cabinet Maker.*

Mechanical Hints.

To Make Superior Lath.—Much of the lath of commerce is of poor quality, and unequal in thickness and width. Often it is sawed out of pine slabs saturated with pine gum which will often strike through a heavy coat of mortar and color the wall. In many instances a builder is located 20 or 30 miles from a market where lath can be obtained. But he may possess an abundance of cheap timber of the best quality for lath, and may have convenient machinery for sawing. The writer was once thus located, having plenty of basswood, which makes excellent laths. He hauled to the sawmill a few logs 16 feet long (the width of the rooms) and had them sawed into plank 1½ inches thick. These he hauled home and sawed into lath three-eighths of an inch thick and 16 feet long. In no place in the dwelling did the lath break joint. The mortar, of clean sand and good lime, was laid on half an inch thick and neatly troweled off; and for more than 20 years, no crack appeared in the walls. The laths were sawed as follows: A circular saw, one foot in diameter, was put on the journal of the firewood-cutter; a movable table, about 16 feet long, was made to move easily on a roller way, about 32 feet long; and the saw was driven by two one-horse railway powers placed side by side. A two-horse railway power or a steam engine would be much better. With such an apparatus one man could saw lath as fast as he could handle a plank.

A Cheap Cellar-bottom.—Grade the bottom of the cellar, letting the outside be at least two inches lower than the middle. Lay cobblestones down in rows and ram them down one-third their thickness into the ground so that they will not rock nor be sunk by heavy weights, as molasses barrels, etc. Fill all the interstices with a grouting of clean sand and water lime, or Rosendale cement. When this has set, cover with a layer, one inch thick, of good cement mortar. In order to spread the mortar even on the surface, lay an inch board one foot from the wall on the surface of the pavement, stand on the board, and fill the space with mortar even with the top of the board. After this move the board one foot, fill the space with mortar and trowel off smoothly. Such a floor is cheaper than one of boards, and exceedingly durable.—*Industrial Monthly.*

Keeping Frost out of the Cellar.—The temperature of a cellar can be kept above the freezing point, and thus vegetables therein preserved against frost, by keeping fire in a small stove, or by letting a pipe extend from the kitchen stove to the bottom of the cellar and then, by means of two elbows, return up to the chimney flue. The hatchways and windows should always be packed or shielded with shavings, sawdust, hay or some other material which will prevent a current of cold air from entering.

How to Build Brick Chimney-tops.—All the brickwork above the superstructure, whatever the material of the building, should be made with cement mortar, which absorbs less moisture than that made of caustic lime and sand. The bricks for a chimney-top should be soaked in water for a few minutes, so that they will not extract the water from the mortar. In order to have mortar become very hard, it must dry slowly. By laying wet bricks, the mortar will set slowly, dry slowly, and eventually become almost as hard as the bricks. Every brick chimney should be covered at the top with a copestone, an arched top, or bricks placed over the flues, like the rafter of a building, for the purpose of turning off the water which would go down the inside, be absorbed by the bricks and perhaps soak through and wet the paper or kalsomining on the inside. A chimney-top made as above will stand the influences of the weather over a hundred years without repairs.—*Industrial Monthly.*

A Cheap Packing.—An engineer says that for packing for the stuffing-boxes of pumps he uses common wood shavings from a carpenter's bench. Fill the box well with shavings and press them down either with a packing-stick or by screwing down the valve once or twice. The water causes the shavings to swell; they are found to be effectual and durable.

Good Health.

Curious Antipathies.

The subject of sympathies and antipathies is extremely curious. Boyle fainted when he heard the splashing of water; Scaliger turned pale at the sight of water cresses; Erasmus became feverish when he saw a fish. A curious story is told of a clergyman, that he always fainted when he heard a certain verse in Jeremiah read. Zimmerman tells us of a lady who could not endure the touch of silk or satin, and shuddered when touching the velvety skin of a peach. Mr. Julian Young tells the story of an officer who could not endure the sound of a drum, and ultimately fell dead when compelled to hear it. There are whole families who entertain a horror of cheese; on the other hand there was a physician, Dr. Starke, of Edinburg, who lost his life by subsisting almost entirely upon it. Some people have been unable to take mutton, even when administered in the microscopic form of pills. There is the case of a man falling down at the smell of mutton, as if bereaved of life, and in strong convulsions. Sir James Eyre, in his well-known little book mentions three curious instances of idiosyncrasy—the case of a gentleman who could not eat a single strawberry with impunity; the case of another, whose head would become frightfully swollen if he touched the smallest particle of hair; the case of a third who would inevitably have an attack of gout a few hours after eating fish.—*London Society.*

Australian Cure for Sore Throat.—A correspondent of the *Queenslander* gives the following cure for sore throat: It cannot be too generally known that all forms of sore throat, whether simple, ulcerated, quinsy, diptheria, scarlet fever, or otherwise, can be either totally cured or greatly alleviated by simply wearing a soft oil silk kerchief twice around the neck, high up and next the skin, especially if worn at night when the pain is first felt. Like Naaman the Syrian, people will take any trouble but the right one, and fly to gargles, blisters, lotions, pills, etc., and keep at them for a month at a time; but an old silk square—why it's too absurd, and so they hug their sore throat and wonder why it don't get better. Not only does the silk cure the sore throat, but it prevents a recurrence of it. I was formerly a martyr to quinsy and ulcerated sore throat, and used to have a whole month of it regularly every winter, and in spite, too, of all the usual battery of pills, gargles, etc., it run its course till I tried the silk; the sore throat then took the hint and has left me alone ever since as a bad customer. I invariably killed it within an hour of any attempt it makes upon me; an old sore throat will take a day to cure. Mind, I do not pretend to say that the silk will cure fever or any other symptom or complication that may accompany sore throat, but this I do say, that it will cure and remove all pain and difficulty of swallowing in the throat without the aid of any local remedy, or it will do it in spite of them, if you do apply them and it both, but, without it, cure only comes by nature, not physic, as far as the sore throat goes; other remedies are neither good nor harm, except as they keep you from trying the infallible silk. —*Australian Paper.*

How the Skull Protects the Brain.—A child bears knocks which would be fatal in old age. This is owing to the skull being thin, uniform in texture, and elastic, in childhood; and to the brain being of a corresponding structure. The brain is at this age soft to a degree that would be unnatural in mature years. This resiliency of the skull, and yielding quality of the brain, explain how the child is uninjured by blows which would be attended with fatal concussions in after life. But there is also a provision in adults for moderating the effects of such accidents. In proportion as the brain acquires firmness during growth, a gradual change takes place in the structure of the bones of the head; the protecting cranium is not simply strengthened; it is not merely thickened; the flat bones which surround the brain are split into layers, an external and an internal one. Those layers have each a different density, and a softer substance than either is interposed between them; the effect of which is, to interrupt that vibration which would otherwise ring around the skull, and reach every molecule of the brain.—*Phrenological Journal.*

Sleep.—A sufficient amount of good refreshing sleep is just as necessary to the health of the body, as proper food and sunlight. No one can do well without it; indeed, he cannot do at all, for when one loses his sleep he loses his strength and power of endurance with it. It is sleep that strengthens our bodies and repairs the waste of our tissues. Every movement we make during the day—every thought, ever action—is attended with a loss of substance. Like a mill running by steam or by water, every hour's work uses up a certain quantity of motive power. During the night, while we sleep, this is all replaced, and we wake feeling refreshed and new, and ready for action again. No matter how hard a person may work, if he only gets a sufficient amount of sleep, he will thrive and do well. If he does not get sleep enough, no matter how little he works, he will always feel tired and uncomfortable. Sleep is the great restorer, the great invigorator. It is poor economy to steal an hour from refreshing sleep, with the expectation of making a paying thing of it.

Growing Men.

Dr. W. Holmes has shown what every body knows, that we are, as a race, deteriorating. But he has not given us the reason why the New England man grows smaller in bone and muscle. Chemistry tells us it is owing to the want of material in the soil to produce bones. Much is owing to our unnatural habits of life. Much to the weakness of our female sex, who do anything but develop their muscular powers. But the main reason why the race deteriorates so rapidly in the eastern part of New England, is owing to the hard granite soil, which does not furnish limestone sufficient to form the bones. In Kentucky, Ohio and Western Vermont, men grow to large size because of the limestone formation beneath the soil. Parts of families have emigrated from Massachusetts to limestone regions, and the result in the next generation, has been a larger bone development in those who left Massachusetts than those who remained. Kentucky, Ohio and Iowa will grow great men. The finest figures in the world will be found in the valley of the Mississippi in a few generations. Indoor labor, so unnatural for men, will weaken the vital powers and stop the growth in large cities, but the great and glorious West, with its broad prairies, will compensate for the growing feebleness of the Eastern States.

Protest of London Physicians Against Alcohol.—A considerable degree of stir has been produced in London by the circulation of a declaration from a large number of the most eminent physicians of that city, in regard to alcohol, in which they state that, believing the inconsiderate prescription of large quantities of alcoholic liquids by medical men to have given rise, in many instances, to the foundation of intemperate habits, they are of the opinion that no medical practitioner should prescribe them without a grave sense of responsibility. They believe that alcohol, in whatever form, should be prescribed with as much care as any powerful drug, and that the directions should be accompanied by the understanding that its use is not to be interpreted as a sanction of exeess, or for the countenance of its use when the occasion is past. They also state that many people immensely exaggerate the value of alcohol as an article of diet; and hold that every practitioner is bound to exert his utmost influence to inculcate great moderation in the use of alcoholic liquids. Being also firmly convinced that the large amount of alcoholic drinking is one of the greatest evils of the day, they urge the utmost caution against doing anything, either in their character as physicians or citizens, to extend its use.

Perspiration.—The amount of liquid matter which passes through the microscopical tubes of the skin in twenty-four hours, in an adult person of sound health, is about sixteen fluid ounces, or one pint. One ounce of the sixteen is the solid matter made up of organic and inorganic substances, which if allowed to remain in the system for a brief space of time would cause death. The rest is water. Beside the water and solid matter, a large amount of carbonic acid, a gaseous body, passes through the tubes; so we cannot fail to understand that they are active workers, and also we cannot fail to see the importance of keeping them in perfect working order, removing obstructions by frequent application of water or by some other means. Suppose we obstruct the functions of the skin perfectly by varnishing a person completely with a compound impervious to moisture. How long will he live? Not over six hours. The experiment was once tried in Florence. Pope Leo, the Tenth, on the occasion of his accession to the Papal chair, wished to have a living figure to represent the Golden Age and so he gilded a poor child all over with varnish and gold leaf. The child died in a few hours. If the fur of a rabbit or the skin of a pig be covered with a solution of India rubber in Naptha, the animal ceases to breathe in two hours.—*Journal of Chemistry.*

Death in the Pipe.—A correspondent who recently visited an English tobacco dealer, was attracted by a sample of which that looked like a superior quality of Cavendish tobacco. The dealer remarked, "what do you think of that?" The correspondent replied "that he thought it looked nice and asked where it came from." "From New York," was the reply. "It's a weed that grows wild. It is not tobacco at all, they tell me." "Does it sell?" asked the other. "It seems to suit the public taste," answered he, "for we sell a good deal of it."

Curious Accidents.—The following described occurrences show how trifling a matter will sometimes result in serious accidents to the human system: The Waranga, (N. S. W.) *Chronicle* reports that a man feeling an ant on his back, in endeavoring to drive it away, dislocated his shoulder. The *Gipps Land Mercury* states that a Mr. Day, of Bairnsdale, while in the act of pulling of his boot, fractured the bone of one of his legs.

Excellent Tooth Paste.—Suds of castile soap and spirits of camphor, of each an equal quantity, thicken with pulverized chalk and charcoal, to a thick paste. Apply with the finger or brush.

Cundurango has long been known to botanists, as reported by Dr. Scherzer. It is used, in Guaco, in infusion or extract of the leaves for snake-bites, hydrophobia and cholera.

Table of Contents.

Editorials.—Important to Mine and Ditch Owners. 209. The Region of the Late Earthquake. 216 The Late Earthquake; Notices of Recent Patents The Comiug Centennial Anuiversary; California Machinery for Colorado, 217. Academy of Sciences. 220.

Illustrations.—Brown's Patent Stop Valves, 209. Sugar Mito; Itch Insect, 217.

Correspondence.—Notes of Travel in Nevada County: Mining in Inyo County, 210.

Mechanical Progress.—Light vs. Heavy Shafting: Boiler Explosions; Compensating Compass: A New Fire-Proof Composition; New Process of Obtaining Iron and Steel; Etc., 211.

Scientific Progress.—Variation of Color in Birds with the Locality; Faye's View of the Physical Condition of the Sun; New Reducing Agent; Tungsten Colors; Spectrum of the Fire-Fly, Etc., 211.

Mining Summary.—Reports from Mines in various States, Counties and Districts; Stock Reports; Leather and Metal Markets; Mining Shareholders' Directory, 214.

Miscellaneous.—The Hot Springs and Geysers of Montana, 214. Senator Cole's Land Bill; Meetings and Elections; New Incorporations, 217.

Useful Information.—Utilizing Insects in India; Hints to Manufacturers; Oiling and Blacking Harness; What is Fermentation? Mechanical Hints.—To Make Superior Lath; How to Build Brick Chimney-tops; A Cheap Cellar Bottom, 215.

Good Health.—Curious Antipathies; How the Skull Protects the Brain; Growing Men; Perspiration; Protest of London Physicians Against Alcohol. 215.

Domestic Economy.—Crumbs of Piecrust—The Grumbler; How to Make Good Bread; Know How to Live; How Summer Suits Should be Washed, etc., 218.

Sales.—The "Brown's Hope" mine in Lida Valley, Inyo county, has been sold to Messrs. Hiskey & Walker for $5,000.

The Placerville *Republican* reports the sale of the St. Lawrence claim of Buel, Bateman & Co., situated about six miles north of Placerville, in Kelsoy township. No figures are given but the amount is probably large as the mill ou the property cost the proprietors $50,000 alone, and the mine ie pronounced a good one.

The Davenport lode in Little Cottonwood, U. T., is reported as sold for $125,000.

A dispatch received here on the 4th inst. says that it is stated on reliable authority that the Eureka Company's property in Tintic District, U. T., has been sold to English capitalists for $720,000.

A Handy Book.—We have received from John Taylor & Co., 512 and 514 Washington strcet, a neatly bound volume containing tables showing the value of silver and gold per ounce Troy of different degrees of fineness. It has also a numher of other convenient tables for the use of assayers, among them one showing the amount of gold and silver, in ounces and fractions, contained in one ton of ore, of 2,000 pounds, from the weight of hullion ohtained in an assay of 20 grammes of ore.

Change of Address.—Samuel Pelton, inventor of Pelton's improved horse-power has removed from Marysville and may he addressed Box 1732 in this city.

A Company has been incorporated in Portland, Oregon, to work the galena mines on the Sautian river.

The Baltimore copper mine, in Fresno county, is to he re-opened and worked.

The Region of the Late Earthquake.

The late remarkahle earthquake in Inyo County will no doubt attract the attention of the world to that locality, and any points concerning its geological formation, appearance, characteristics, etc., will he of interest. Mr. Henry G. Hanks, who resided in that part of tho country for a number of years, has given us a few notes, the result of his personal observation, whichgive a very good idea of the volcanic nature of a region of which hut little is known.

Those who have visited Owen's Valley have heen struck with the strongly marked evidences of intense and comparatively recent volcanic action for a hundred miles north and south of Lone Pine. As far north as Owen's Lake very ancient outflowe of lava form the surface of the country. The valloy in which this lake is situated, is a circular basin about fifty miles in diameter, surrounded by low mountains. The body of water, which is about 25 miles long, lies near the southeast side. Near the lake is a remarkable mountain, which from a distance seems to be loose sand, but which on a close examination proves to be volcauic ashes and pumice, a disintegrated portion of which forms the soil of the valley in which it is situated. Pieces of pumice are sometimes seen floating in the lake or thrown by the winds and tide upon its shores. Great bouldors and masses of obsidian are found in the vicinity, while small angular fragments are scattered through the loose alkaline soil.

That the lake once filled the whole valley seems to be proved by the fact that water marks are seen along the hase of the surrounding mountains, and banks wonderfully formed by the ancient lake, are seen in successive terraces approaching the present level of the water.

The watere of the lake aro strongly alkalino and very offensive both to taste and smell. The odor arisiug from them is that of the refuse of soap works. The hot spring at Benton which hy a bold eacrilege is conducted almost hoiling through a flume and compelled to turn the wheel of a quartz mill, and tho remarkable thermal spring which gushes in a broad stream from the foothills in Adobe meadowe are evidences of latent volcanic action.

Let two or more intelligent observers express their opinion of this locality in ordinary conversation and they would soou be unanimous iu the opinion that Mono Lake valley is in itself a volcanic crater and that all of the volcanic rocks seem on every eide had their origin in it. From its margin, in every direction except west, streams of lava have flowed across hills and plain. For many miles the whole country is covered with blocks of lava, pumice, obsidian and trap. During the eruption, valleye were filled up and what were formerly mountain tops, are now outliers, projecting like islands above the frozen sea of lava.

In some localities since this action ceased, denudation has taken place, deep gorges and cañons have heen cut hy water and in some cases new hills have been formed, capped in every case with the ancient lava. Other beds of pumice of more recent origin flowed across the country in a southeasterly direction, crossing Adobe meadows, and the hills forming Black lake valley and entering Owens' valley at Whisky Flat. It seems to have heen formed hy two eruptions of different ages. It is a sort of breccia. A stream of pale yellow lava or pumice seems to have flowed over boulders of a darker colored variety, washed from an older deposit, surrounding without fusing them and the whole congealing into a breccia or conglomerate. Throughout the mass are small rounded nodules of a nearly transparent obsidian and angular fragments of a darker colored and uearly opaque variety. This formation extends nearly to the foot of the White mountains. At Adobe Meadows a stream of water has cut through it at a point where it is several hundred feet thick. The soil of Adobe Meadows is formed entirely of this formation. Its color is the same, and a microscopical examination shows its composition to bo identical.

About nine or ten miles abovo Camp Independeace aro a uumber of volcanic cones which have every appearance of having been in recent action. "The Volcano" is a cone which stands in the valley apart from the Sierras. This cone has evidently formed itself. I have never heen to the summit although I have often wondered at the immense outflow of lava which has cougealed upon its sides. From all these cones, black pathways to the valley reveal the course of the lava streams which must have epread devastation and ruin in thoir wake. On the Inyo side a single crator appears, from which, however, an astonishing quantity of lava has been thrown out.

The waters of Owens river which flow dowu from the high Sierras as pure as the snows that give them hirth, begin to collect the soluble salts from the decomposing lavas even before they reach the level of the valley, as the stream has cut a deep cañon through the peculiar lava before mentioned, which is soveral hundred feet deep. During the summer, wheu the freshets occur and the rain overflows its banks, minature lakes are formed, which, drying as the watere return to the channel, deposit an incrustation of alkali and salt which gleams in the bright and fervid sunshine like patches of snow. At Black Rocke the waters which burst out from under the lava are nauseous and alkaline. This alkaline solution mixes with the already contaminated waters of the river and increases its impurity. When it reachcs the barrier which checks its further flow, the waters spread out and form Owens' Great Lake. The river is extremely crooked. In travorsing 84 miles of latitude it flows hundreds of miles, so circuitous is its course. Every mile adds to its impurity until it deposits its collocted salts in the lake. The heat of the sun maintains an irregular equilibrium. The water soon becomes saturated and supersaturated and deposits the matter it can hold no louger in solution, in the form of a remarkable travertine, which coats the rocks and grows like coral upon any objoct which offers itself as a nucleus.

The waters of the lake are remarkable, having a specific gravity of 1.060 with the appearance of a thin yellowish oil. An analysis shows it to consist of potash and eoda with a trace of magnesia, and sulphuric acid and chlorine with traces of horacic, phosphoric, silicic and hydrosulphuric acide.

There is a remarkable similarity be tween this lake and the Dead Sea, not only in the lake itself, but its surroundings.

From the foot of Owen's Lake to Haiwee meadows the distauce is 14 miles. There is nothing remarkable or characteristic at this point besides a small extent of grass land and a stream of brackish water; but the evidences of recent volcanic action are seen on every side. It is difficult to put aside the idea that Owen's river formerly ran through this region, and that some terrihle convulsion of nature has lifted the walls which ehut off its flow and caused the lake to spread out. This seems to be one of the centers of a wide spread action, which resulted in the formation of the deserts of the Great Basin. This must have heen comparatively recent, for Owen's river valley was formed before the age of the mastodon and the extinct species of horse, the remains of which have been found in digging wells. There is reason to believe that hefore the eruption, or age of eruptions occurred, that Owen's Valley was as fertile and its waters as sweet as those of the Yo Semite or any other mountain valley in the Sierras. All the volcanic deposits I ohserved seemod superficial. There ie nothing to indicate that the Iuyo mountains owe their origin to this or any similar cause.

Between Haiwee meadows and Little lake there is a large volcano which stands prominent in a wide plain from which in every direction streams of lava havo run. This cono is intensely red in color, which is due probahly to the oxidatio nof the ferruginous matter thrown out during its eruptions.

During several years residence in that county I did not experience auy earthquakes of magnitude. But one occurred several years ago in the mountaine near the head waters of Kern river, which was very similar. I think an account of it was published at the time. The ehocks were very violent and often repeated. Those who were there describe the scene as one of terror. Large houlders were dctached from the mountain sides and rolled into the valley helow. The ground was in almost constant vibration for several hours. From what I know of the country I ehould not be eurprised to hear of eome of the ancieut volcanoes bursting into a state of eruption at any time.

Death of Professor Morse.

The telegraph, like a son carrying the news of the death of a fathor, has brought us the intelligence that Samuel Finley Breese Morse, the inventor of telegraphy, died in New York on the 2d inst. The death of Prof. Morse has heen hourly expected for some days. The benefit of the inveution which was created by his fertile brain, to the civilization and progrese of the world at largo can nover be calculated, and the personal distinction achieved by its success has been a subject of congratulation to the people of the United States. His name is well worthy of being placed at the head of the list of benefactors to mankind and will no doubt exist in the memory of man as long as history ehall remain.

Prof. Morse was born in Charlestown, Mass., April 27th, 1791, and had almost finished his eighty-first yoar at the time of his decease. He wae the son of Jedediah Morse, a clergyman and geographer, known as tho father of American geography. He graduated from Yale College in 1810, and eailed for London in 1811, to etudy painting, where he succeeded well in his profession. In 1813 he received tho gold medal of the Adelphi Society of Arts for a plaster model of "Dying Hercules" taken from an original painting of his own. He returned to the United States in 1815, and became subsequently one of the founders of the National Academy of Desigu, being its first president. In 1829 he paid another visit to Europe and returned in 1832. A fellow passenger on his returu trip, Prof. C. T. Jackson, was describing the experiments that had just been made in Paris with the electro-magnet, when a questiou arose as to the time occupied by the electric finid passing through the wire. Tho reply being made that it was iustantaneous, Jackson suggested that it might he carried to any distance and that the electric spark might be made a means of conveying intelligence. Thie suggestion took deep hold of Morse, who proposed to develop the idea; and hefore the voyage was over he had drawn out the general plau of the system known by his name.

It was not until four years afterwards that he succeeded in fully demonstrating his thoory upon a wire half a mile long. Congress voted him $30,000 to enahle him to carry out his views and, in 1844 he saw the realization of his hopes in the perfect

working of a wire 40 miles long, which had been constructed between Baltimore and Washington. Honors have been freely showered upon this greatest of American inventors both at home and abroad. He was a member of a number of American and European scientific and art associations, and medals and crosses have been presented to him by many European rulers. The most distinguished tribute ever paid him was by ten European governments combined—those of France, Russia, Sweden, Belgium, Holland, Austria, Sardinia, Tuscany, the Holy See and Turkey, whose representatives assembled in Paris at the instance of Emperor Napoleon to consider the best means of giving him a collective testimonial, which resulted in a vote of 400,000 francs as "an honorary and personal reward to Mr. Morse for his useful labors."

Professor Morse lived to see the system he invented adopted in every portion of the globe, bringing its most distant parts within speaking distance of each other, and all the nations of the world have vied in doing him honor. Like all inventors he experienced considerable trouble in bringing his method before the people, but when it was once understood its vast importance was at once recognized and it has been ever since one of the greatest of educators, the chief aid of commerce, the highest convenience of civilization, and one which revolutionized the entire business of the world. He has gone from us, not like a meteor in a wild blaze of transient brilliancy; but in the full effulgence and glory, of honors as enduring as the world.

The Late Earthquake.

The earthquake which occurred on the 26th ult. was felt the whole length of California and as far inland as Winnemucca. The shock though comparatively a light one in this city, was one of the most severe on record in other localities, as well as one of the most widely diffused. A great variety of opinion is expressed as to the intensity, and in the numerous descriptions much discrepancy exists concerning the duration. The center or initial point of the shock seems to have been at Lone Pine, in Inyo County, the center of a mining district of that name, situated on the western base of the Inyo Mountains not far east of Mount Whitney. The country in which it is located is undoubtedly of volcanic origin and abounds with evidences of comparatively recent volcanic action. From facts elicited by the late "temblor" it is reasonable to suppose that the Kern or Inyo region is the seat of the greatest energy of the failing volcanic forces which raised the Sierra Nevadas and covered the surface of the country with the evidences of its power.

The phenomena which occurred in that region were of the most appalling kind and some twenty three persons were killed and thirty injured by the falling buildings. Eye witnesses describe the scene in a manner which leaves no doubt of the power of the shock, and makes it a subject of congratulation that this city with its thousands of inhabitants, lofty brick buildings, and crowded houses, was so far from the center of disturbance. It is said that an instant after the shock occurred at Lone Pine (about half past two in the morning) not a building was left standing. The houses appeared to crumble away and fall into ruins. Cries for help from the wounded filled the air, and shock succeeded shock, added to the already overwhelming fright of the people who had escaped the first disastrous effects. Different accounts place the number of shocks all the way from 500 to 1,000, and it is asserted that each was invariably accompanied by an appalling noise, the reverberations of which through the mountains were as terrific as the noise itself. It sounded like the thundering explosion of a thousand heavy cannon fired at the same time. It seemed to be directly under foot, and at Independence the noise could be heard advancing from Lone Pine, and as the shock came on, thousands of huge rocks tumbled from the crags on either hand and crashed into the ravines and upon the edges of the valley below.

Big Owens Lake is said to have risen some four feet, and the Owens river overflowed its banks, whilst Little Owens Lake, 24 feet in depth, has entirely dried up. The earth is cracked and seamed in many places, and old springs dried up, while new ones were created.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co's. Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

Machine for Painting Wire Cloth.—Samuel Graves, S. F. The object of this invention is to provide a machine by which fibrous substances, and wire cloth especially, can be rapidly and thoroughly painted. It consists in passing the long strips of cloth from a reel, through a bath of paint where it is thoroughly coated, and thence between one or more sets of elastic rollers which squeeze out all superfluous paint from the meshes, but leave the wire thoroughly coated.

Permutation Lock.—Wm. C. Bussey, S. F., Cal. The object of this invention is to provide an improvement in that class of locks which are commonly employed for safes and bank-vaults. It is called a detached cylinder lock, and consists mainly in the employment of operating devices which render it possible to remove the lock to a considerable distance from the knob, and also in the use of novel devices between the knob and the lock proper by which the combination is set and operated. An elastic connection is employed so that it will be impossible to tamper with the lock from the outside.

Brick Kiln.—Francis F. Boudrye, S. F., Cal. The object of this invention is to provide such an arrangement of the lines of bricks and the conducting passages for

THE SUGAR MITE.

heat, that all parts of the kiln shall be exposed uniformly to the heat and thereby the burning and spoiling of many brick in every kiln is avoided.

Improvement in Traction Engines.—W. W. Hanscom, San Francisco, Cal. This invention relates mainly to improvements in applying power to the wheels of traction engines so that all gearing and complicated machinery are dispensed with. It consists in the employment of hydraulic pumps which are operated by means of steam cylinders. The hydraulic cylinders which are operated by the pumps are connected directly with cranks, which are fixed upon the axles or wheel centers, and in such positions as to have no dead point. The whole mechanism is much simplified.

Submarine, and Other Walls.—Wm. H. Foye, San Francisco, Cal. This invention relates mainly to an improved method of constructing walls, by which a system of ground and vertical rods are employed which guide and assist in placing the stones, and also serve to retain them firmly in place after they are there. It also relates to a device for attaching a cornice when employed upon buildings.

Little and Big Cottonwood Districts, in Utah are still covered with snow. The Emma and other mines are working, however, with full sets of hands and good prospects.

Wheat Shipment.—The large ship, Adriatic, cleared for England this week with 3,300 tons of wheat, the heaviest shipment this season. The "Glory of the Seas" carried 3,200 tons. The total shipment since the 1st of July amounts to 1,162,000 centals against 3,500,000 centals for the same time last year.

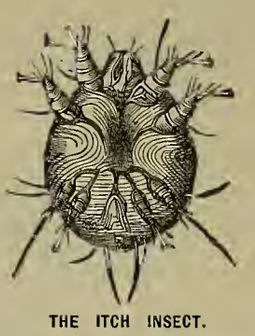
Microscopic Wonders.

The uses and advantages of the microscope crowd upon us in such profusion that a volume would be required to merely enumerate them. There is no department of science, art or manufactures for the benefit of which it is not called into requisition. It is no longer a costly toy, as at its first introduction, but it is a genuine and practical aid to man in almost every research or employment in which he is engaged.

Perhaps in no direction has its wonder-revealing powers been more fully exhibited than in the world of microscopic life which it has made known to us. Equally interesting and useful is the assistance which it has rendered in the study of the various orders of insects, not strictly microscopical, but whose minuteness rendered any practical study of their structure, habits, etc., utterly impossible.

There is a class of insects known as *Acarus*, commonly called mites, and belonging to the spider family, a more accurate knowledge of which, than can be obtained by the naked eye, is almost indispensable to man, in his present advanced social condition. We allude to the parasitical insects which so seriously interfere with him by their depredations upon his food, his domestic animals, the feathered friends by which he is surrounded and most of the vegetables, etc., which he cultivates, and even with his own person.

We have herewith figured two of these insects, the *Acarus sacchari*, found in unrefined or raw sugar, and the *Acarus scabici*, sometimes found under the human skin in the pustules of a well known cutaneous disease. There are, besides these, great numbers of similar insects, some one of which is peculiar to nearly or quite every quadruped or feathered creature. A microscopical knowledge of the physical constitution, habits etc., of such insects is



THE ITCH INSECT.

almost indispensable in enabling us to rid ourselves and our domesticated friends of their annoyances, which if not arrested often lead to fatal and most destructive results.

Many people were much startled by the reports of the immense number of mites found in raw or unrefined sugar, when their presence was first announced by Dr. Hassel in 1868. The Dr. found them in no less than 69 out of 72 samples of sugar examined; but he did not detect them in a single specimen of refined sugar. The conditions of refined sugar are doubtless unfitted to their existence therein. In one sample of raw sugar he found no less than 500 mites in 10 grains; equivalent to 100,000 in a single pound! When they are present in great numbers they may sometimes be detected by a good eye, unaided by a glass—appearing like little white specks. The "Grocer's itch" is caused by transference of these mites to the human skin. *Mem.*—Don't eat raw sugar.

A mere sight of the picture of the ugly looking little fellow which we have placed by the side of the *Acarus sacchari*, will probably be all our readers will care for, at this time, and we will not inflict them with any further reference.

This class of insects have a rounded oval body, without the usual division between the head and body. They usually have four pairs of legs. Perhaps the most familiar type of this class of insects is the common head louse—*Pedicule Capitis*, and the insect which infests the common barn-yard fowl—more easily detected on the head or under the wings of very young chickens.

One of the cheapest microscopes extant is that advertised in another column, and known as Craig's microscope. This instrument will do very well for beginners, or for cultivating a taste for such studies; but we cannot recommend it as a very affective instrument for practical study.

The Coming Centennial Anniversary.

Mr. John Graham, of this city, has received a letter from Judge J. D. Creigh, the California delegate to the Commission which was called to meet at Philadelphia for the purpose of making arrangements for the approaching Centennial anniversary of our National Independence. From a perusal of that letter we infer that the preparations indicate that the event will be made one of greater magnitude than anything of the kind which has yet entered into the civil history of any nation on the globe.

The Commission, which consisted of twenty-seven members, has held several sessions, and has selected as a site for the celebration, the well known locality of Fairmount Park, upon which will be erected a main building which will cover about 50 acres of ground! The building will consist entirely of iron and glass and will cost about *seven and a half millions of dollars!* Other minor and special buildings will also be erected. The Commission estimate that the entire cost of the celebration will reach *fifteen millions* or more. The city and entire State, in fact, is alive to the importance and magnitude of the event, and citizens of all classes are making every possible exertion to encourage and help on the enterprise.

In consequence of some needed legislation by Congress and the State of Pennsylvania, the committee has adjourned until the 22d of May, when they expect to meet again and make all necessary arrangements to put in active progress the material preparations for the grand event. Very properly, and with a due appreciation of the importance of the feeling which should pervade the national heart, the most thorough arrangements are contemplated to unite all sections of the country in this demonstration; and every good citizen will hope that nothing may transpire to, in the least, interfere with the realization of this purpose in its fullest and most comprehensive sense.

Mr. Morrell, who was offered the Presidency of the Commission, has declined the honor in such a manner as to give the whole country more time for consideration in its choice of a gentleman in whom might be centered such feeling and confidence as would command the greatest amount of admiration. Some gentleman will undoubtedly be selected for the office, who, by position and all the amenities of nature and other circumstances, will be able to conduct the first grand celebration of the birth of the Nation in a manner worthy of the event and satisfactory to the people as a whole.

As we understand it, the design is not to make the occasion simply a grand gala-day, but in addition to the ceremonies, displays, addresses, etc., appropriate to such an event, the day will also be made the grand opening of one of the most magnificent industrial displays which the world has ever yet witnessed. The main building alluded to is designed for the reception and display of the industries of the country, and it is confidently expected that the United States will be able to show more strength and genius, in the mechanic arts and sciences, through the influence of that celebration, than has yet been shown by any "World's Fair" or other similar means yet attempted by the nations of the earth. If the proper current is set running, the only difficulty will be for Philadelphia to find room for all that is offered to show the productive resources of the country, and the progress which has been made during the first century of our national existence. It is confidently expected that the first centennial of the United States will be the grandest civil and industrial exhibition ever known in history.

California Machinery for Colorado. A 15-ton mill is being built at the Union Foundry for Hon. N. B. Judd and F. W. Crosby of Georgetown, Colorado. This is a pioneer movement in that quarter, California machinery being hitherto unrepresented in that Territory. The mining interests of Colorado, more especially her silver interests are now in their infancy but are full of promise for the future. Our foundrymen have had over 20 years' experience in building milling and mining machinery, and their work we think cannot be equalled, let alone surpassed, in the world, and we believe that if the proper steps are taken they will find in Colorado a good customer.

Numbers of miners are leaving Salt Lake City and going to Star and other districts south.

Domestic Economy.

Crumbs of Piecrust—The Grumbler.

The grumbler is one of the most unfortunate of beings; he travels the worst roads, drives the worst horses, drawing the worst vehicle under the sun. He eats the worst dinners, especially at home, and wears the worst clothes of any live man.

He spends most of his thoughts in wondering why he is not Alexis, or the Prince of Wales, or the President of the United States, or the Grand Mogul of somewhere, instead of plain John Smith, Jr.

To the discontented man his wife, heaven help her, is a constant source of annoyance. She is too tall or too short, too grave or too gay, too voluble or too reticent, in fact, it is doubtful whether a companion imported directly from the celestial regions, would be a complete success in his eyes.

If she goes with him to an evening entertainment or for an afternoon visit, he spends the homeward ride in grumbling because she does not sing like Mrs. A., or play like Mrs. B., or dance like Mrs. C., or talk like Mrs. D., and ends by complaining because she is moodily silent, and won't answer him at all.

He wonders why she looks so sad and careworn, why she does not welcome him as gladly, or laugh as cheerily as before marriage; why she has the habit of starting nervously every time he enters the room; and why she does not care to ride, or walk, or talk with him. Poor man! he is continually planting briers by the way! What wonder if he reaps a plentiful harvest of thorns?

Does our grumbler travel, he meets with more hair-breadth escapes, comes in contact with more villainous people who make him the sole object of their vile intentions, which, however, from his superior discernment he succeeds in eluding, than Ledyard or Von Humboldt ever encountered.

The best way to cure a discontented man is to help him complain; agree with him that he is the most unfortunate person living, and he will very soon undertake to prove that he has quite as much to be thankful for as the most of people.

A friend whom I was once visiting had the misfortune to have a husband who was always exaggerating the ills of life. One morning he sat down to breakfast as usual, ate a hearty meal, and just before its close, leaned back in his chair, saying that he was unwell; and forthwith began to descant upon his many ailments. He declared that he felt that he was not long for this world; it was his fate, but he was resigned. Here he recounted a number of incidents to prove that an evil genius had followed him from his cradle to the present moment. Said he:

"I must consult a physician immediately."

"Yes," replied his wife anxiously; "you must go to Dr. Cur'em this very day. Start right away, do dear; don't defer; now please don't—"

"There, that's just like a woman," replied the husband, "you always think that I can leave my business at any moment."

"But," rejoined the wife, "only think of the danger of delay; you are going to put it off until it is too late. You will die, I know you will! Oh, dear, oh, dear! I know you will," she cried hysterically.

"Well," said he angrily, I can't nor shan't leave my business to-day; so there is no use in making a fuss," and marching firmly to the hat rack he invested himself in coat and hat and left for his place of business.

As he passed out of sight my hostess burst into a merry laugh; and seeing my look of surprised inquiry, remarked, "you know Henry is rather notional, and I find it best to humor him."

I think she was right, for during my stay I heard nothing more of Henry's ailments. His wife's prescription no doubt proved more efficacious than any which Dr. Cur'em could have administered.—*Western Rural.*

Look to your Wall Paper.—The filthy custom of pasting one wall paper over another till a thickness of an eighth of an inch or more is accumulated is too common, and is attended with the worst consequences. This, as ascertained by the *Lancet*, was the cause of the puzzling offensive smell at Knightsbridge Barracks, England, that recently threatened the whole establishment with fever. The examination of the drains and taking up of the floors revealed nothing, while the introduction of increased means of ventilation left the evil as it was. At last an examination was made of the wall papering, when it was found that one paper was pasted upon another till a thickness was accumulated amounting in one case to fourteen layers. Between these layers there was rotten paste, in which fungi and even maggots germinated; while the wall being hollow, the stench spread into the passages and over the establishment.

Apple Puffs.—Peel and core as many sour apples as will be needed, simmer with a little water till tender, then add a half pound of sugar to a pound of apples, let it simmer till the apples become a kind of marmalade; take it up, and when cold put it into puff paste and bake quickly; when done ice it, return to the oven just long enough to turn the icing golden.

How to Make Good Bread.

Put what flour will be needed for two or four loaves, according to the size of your family, into your bread bowl or pan. Make a hole in the middle, pressing the flower compactly up to the sides of the pan, then pour in sufficient boiling water to thouroughly scald and wet about one-half of the flour. When cool stir in one cupful of lively domestic yeast, previously soaked in warm water. Set it near the stove or in a warm place in cool weather, cover closely just before retiring at night, and it will be light by morning, when a teaspoonful of salt, and enough more warm, but not hot, water to wet all the flour must be added; knead it very thoroughly, and set it to rise again. When light, work it again, and put it in the pans to rise for the last time, and as soon as it is light bake in a moderately heated oven. If the oven is too hot at first the bread is apt to get brown on top and bottom too soon, and then it will not be done in the middle. A moderate oven at first is best, increasing the heat gradually until the bread is about half done, when it should be of a steady heat till the bread is done.

The Secret of Baking Bread.

The grand secret and mystery in having the bread come out of the oven delicious, inviting and nutritive, is the exact point of time in putting it in. While in the state of dough it will readily run into various stages of fermentation—the first of these is saccharine, or that which produces sugar—the next is the vinous—the third the acetous, or that producing vinegar, etc. If the dough be formed into loaves, and placed in the oven before the first fermentation has taken place, the bread will turn out heavy. If it be kept from the oven until the second fermentation, it will prove light enought but tasteless, and little better than the same quantity of saw-dust. If it be delayed until the acetous fermentation had occurred, it comes out sour, and altogether uneatable.

It is, then, during the first or saccharine fermentation that it should be cast into the oven; and it will, if sufficiently baked, be found a sweet and wholesome food. That bread should be without sweetness, when allowed to run into the vinous fermentation is very easily explained—the saccharine matter produced by the first fermentation being converted into a vinous spirit, which is driven off by evaporation during the process of baking. This kind of bread may be easily distinguished without tasting, by its loose, open appearance—the pores or cells being very large—whereas, really good bread is marked by fine pores, and a sort of net work in uniform appearance.

A French Broil.—Select a spider or saucepan with a smooth, clean bottom, set it over the range or stove until really hot, and then lay on a good tenderloin or sirloin steak; keep the spider very hot, and turn the steak as often as every two minutes—no longer; when done sprinkle over salt and pepper to suit the taste of those who are to eat it; continue to turn the steak often till sufficiently done; just as you are to take up and dish the steak dust a little flour over it, spread on a tablespoonful of butter, or, if a large steak, a little more; turn it over, dust on more flour, and spread on the butter as on the first side; turn again, set the saucepan back from the hot fire, take the steak on to the platter, and set in heater or oven to keep hot, but not to cook any more; shake more flour into the butter in the saucepan, set again over the fire, and as soon as the butter bubbles up through the flour, rub it smooth with a spoon, and pour in a few spoonfuls of boiling water, and as soon as it thickens pour over the steak and serve hot.

Know How to Live.—Prof. Blot can never teach you this. Books on cookery will never enable you to learn the secret. Care and experience only will enable you to attain such a desirable end—they are as essential to good housekeeping as to any other duty.

It would seem ridiculous for a man to attempt to do business without going to his office and knowing, from day to day, what is being done there.

The extravagance of living is not all in high prices, or high rents. It is in *waste*. Take a house full of the best servants, and if the mistress is always occupied with company, or engagements away from home, what hope can she have that her servants will be careful. They get no credit for it. Their work *seems* well done, as far as it is likely to meet their mistress' eyes, as she passes from her chamber to the parlor or dining room; and knowing that she will not search out their shortcomings any further, they save themselves trouble by slighting all that is under the surface.

We forget that our servants are human; and conscientious, and well-meaning as we may be, are we sure if we were in their subordinate position, we should do any better?

Be better housekeepers. Look more carefully after your homes and home cares, and there will be fewer hotels and crowded boarding-houses, and more happy husbands, and well-trained children, and less distress on the part of uneasy women because they have not enough to do.—*Home Monthly.*

To Clean Smoky Mantels.—A strong solution of alum and water, applied while hot, will, it is said, effectually clean a smoky mantel. When dry, it should be sand-papered and receive one coat of paint.

How Summer Suits Should be Washed.

Summer suits are nearly all made of white or buff linnen, pique, cambric or muslin, and the art of preserving the new appearance after washing is a matter of the greatest importance. Common washerwomen spoils everything with soda, and nothing is more frequent than to see the delicate tints of lawns and percales turned into dark blotches and muddy streaks by the ignorance and vandalism of a laundress. It is worth while for ladies to pay attention to this, and insist upon having their summer dresses washed according to the directions to which they should be prepared to give their lanudresses themselves. In the first place, the water should be tepid, the soap should not be allowed to touch the fabric; it should be washed and rinsed quick, turned upon the wrong side, and hung in the shade to dry, and when starched (in thin boiled, but not boiling starch) should be folded in sheets or towels, and ironed upon the wrong side, as soon as possible. But linen should be washed in water in which bay has been boiled, or a quart bag of bran. This last will be found to answer for starch as well and is excellent for print dresses of all kinds, but a handful of salt is very useful also to set the colors of light cambrics and dotted lawns; and a little beef's gall will not only set, but brighten, yellow and purple tints, and has a good effect upon green.—*N. Y. World.*

Pickles.—If Hippocrates could escape from the dominions of Pluto and visit this country of pickles, pancakes and hot bread, and contemplate the consequent pasty faces, hot breaths and toothless gums, he would every where meet with, he would see just cause to undertake the *communis* of his maxim. He would see people, sensible in other respects, munching pickles as boys munch apples, filling themselves with hot new bread, and meat with all its juices dried up, which by way of destroying the efficiency of nature's solvent, the saliva, diluting it at every mouthful with water or other liquid, and to crown all, taking bodily exercise in an inverse ratio, to the amount of food swallowed—we might fancy that dyspepsia and indigestion would be seen holding high carnival over every barrel of pickles which *pater* or *matter familias* provides to correct the greasy messes of the frying-pan. Thus we find, as one crime leads to another, so one error causes many—remove the superabundant grease, and there will be no need for a peck of pickles—probably the safest and surest plan would be to knock the bottom out of the frying-pan which is the father or mother of nearly all the ills the belly is heir to. There are more constitutions ruined by the frying-pan than by the whisky barrel; indeed, the former leads to the latter.—*Ex.*

Packing Cucumber Pickles in Brine.—If they are dirty or sandy, wash them by throwing water over them, but do not rub them if it can be avoided. Put the pickles, as soon as picked, into clean barrels only, avoiding kerosene or greasy barrels especially, even if burned out. Fill up the barrel and gently shake them down; then put on brine made of fifteen gallons of water and a half bushel of common fine salt. This is sufficient for all that can be put into a forty gallon barrel; then trim off the edges of the barrel head, and lay on it the pickles, and put on two bricks, or a small stone, to keep the pickles under the brine all the time.

Examine the barrels daily, to see that the brine does not leak or soak away, and leave the pickles out of the brine. If the pickles need more brine, put it on. Fill up the barrel every ten days until you have added one more bushel of pickles. See that the picklos are kept under the brine all the time; and when ready to ship, pour off two gallons of brine, and nail a piece of board crosswise over the head and they are ready to send to the depot. *Western Rural.*

Mrs. Snow's Cream Cakes.—One cup of boiling water, one-half cup of butter, put this on the stove, when boiling add one cup of flour, stir it five minutes, set away till it is almost cold, then stir in one egg at a time till you get in five eggs, then take a piece of soda the size of a pea dissolved in a teaspoonful of cold water, and put it in the mixture. Heat your tin hot that you are to bake your cakes on, grease it, drop your cakes on, bake twenty-five minutes, and do not take them off the tin till they are cold. Have your oven hot to commence with, and when the cakes are almost done let it cool a little.

For the Cream—One pint of milk, one cup of sugar, one-half cup of flour, two eggs. Beat the eggs, sugar and flour together, put the milk on the stove to heat it, then stir the mixture into the milk slowly and when it boils to thicken take it off and let it cool before putting in the cakes.

Cider Without Apples.—Water, 1 gal., common sugar, 1 lb., tartaric acid, 1 oz., yeast, 1 tablespoonful; shake well; make it in the evening and it will be fit for use the next day. In quantities for bottling up, put in a barrel 5 gallons of hot water, 30 lbs. common sugar, ¾ lb. of tartaric acid, 25 gallons cold water, 3 pints hop or brewer's yeast, worked into paste with one pt. water and 1 lb. flour. Let it work in the barrel 48 hours, the yeast running out at the bung all the time, putting in a little occasionally to keep it full, then bottle, putting in 2 or 3 broken raisins to each bottle, and it will nearly equal champagne.

PACIFIC STONE COMPANY.

Ransome's Patents International,

For which Commissioners for the Exhibition of 1862 awarded the Prize Medal, and Gold Medal at the Mechanics' Institute Fair, 1871, of San Francisco.

REMOVAL.

This Company have removed from the corner of Turk and Larkin streets, to their new and Commodious works corner of Greenwich and Octavia. They have established an office and salesyard at the Junction of Market and Bush, where they will keep constantly on hand an assortment of ORNAMENTAL, BUILDING, CEMETERY and GRINDSTONES. Orders will be received at the above office from all who wish to get good work at low prices. Send for Circular. 5v24-3amslamrly

Dupont's Gunpowder, Safety Fuse,

—AND—

WINCHESTER REPEATING ARMS.

DUPONT'S Superior Mining Powder (saltpetre), F. FF-FFF.

DUPONT'S Blasting Powder, in air-tight corrugated Iron Kegs, C-F-FF-FFF.

DUPONT'S Celebrated Brand, Diamond Grain, Nos. 1, 2, 3 and 4, in 1 lb. and ½ lb. canisters.

DUPONT'S Unrivalled Brands, Eagle Duck and Eagle Rifle, Nos. 1, 2, 3, in half kegs, qr. kegs, 5 lb. tins, and in 1 lb. and ½ lb. canisters.

DUPONT'S Standard Rifle, Fg-FFg-FFFg, in kegs, half kegs and qr. kegs, and in 1 lb., ½ lb., and ¼ lb. canisters.

DUPONT'S Superior Rifle, A. F. & Co., F-FF-FFF, in kegs, half kegs, qr. kegs, and in 1 lb., ½ lb. and ¼ lb. canisters.

DUPONT'S Cannon, Musket, Meal and Fuse Powder.

EAGLE SAFETY FUSE (manufactured near Santa Cruz, Cal., by the L. S. & P. Co.) Constantly on hand full supplies of their Celebrated Brands, Waterproof and Submarine, Triple Taped, Double Taped, Single Taped and Hemp Fuse. Fuse made especially to explode the Giant Powder and Hercules Powder Caps.

The above named Fuse are warranted equal to any made in the world.

WINCHESTER REPEATING ARMS (Henry's Improved) and Fixed Ammunition.

A large and complete stock of these celebrated arms constantly on hand, to wit:

Repeating Sporting Rifles—Oiled Stocks.

Repeating Sporting Rifles—Varnished Stocks.

Gold, Silver and Nickle-plated Rifles—beautifully Engraved.

Repeating Carbines—Oiled Stocks.

Repeating Carbines—Gold, Silver and Nickel-Plated and Engraved.

Muskets—Angular or Sword Bayonets.

Full stock constantly on hand of all the different parts of the Winchester Arms.

Cartridges in cases (Brand H), manufactured by the W. R. A. Co. expressly for their arms.

A full and complete stock of the above named merchandise always on hand and for sale by

JOHN SKINKER, Sole Agent,

5v24-6m-1amr 108 Battery street, S. F.

The California Powder Works

No. 314 CALIFORNIA STREET,

SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,

MINING,

And BLASTING

POWDER,

Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.

We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

HERCULES POWDER,

Which combines all the force of other strong explosive now in use, and the lifting force of the best blastin powder, thus making it vastly superior to any other pompound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office.

16v20-3m JOHN F. LOHSE, Secretary.

To Parties About Building.

A person who is competent to prepare plans and take charge of the construction of Dwellings, Mills, Bridges, or other architectural improvements, will make favorable engagements with persons or corporations in the city or the interior. DICKINSON'S
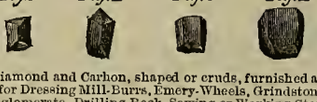
Patent Shaped Diamond Carbon-Points.



Diamond and Carbon, shaped or crude, furnished and set for Dressing Mill-Burrs, Emery-Wheels, Grindstones, Conglomerate, Drilling Rock, Sawing or Working Stone, Truing up Hardened Steel, and for other mechanical purposes. Also Glaziers' Diamonds. See Scientific American, July 24th, Nov. 20th and 27th, 1869; Engineering and Mining Journal, Jan. 17th, 1871; Journal of the Franklin Institute, Philadelphia, June, 1870. For Circulars descriptive, and Prices, send stamp to
1v24-6m J. DICKINSON, 64 Nassau St., N. Y.

THE TANITE COMPANY,
STROUDSBURG, PA.,
Sole Manufacturers of
THE TANITE EMERY WHEEL,
And builders of Emery Grinders, Saw Gummers, Etc., Etc.
Emery Grinding Machines,
At $15, $25, $35, $40, $55 and $100. DIAMOND TURNING TOOLS, $15 each.
SOLID EMERY WHEELS,
From 40 cents to $113 each.
Every IRON FOUNDER can save money by using these Wheels to grind the sprues and gates off of castings. Every MACHINIST can save money, files, and labor, by using them to shape his lathe tools, to grind off chilled edges, to finish nuts, etc., etc. Every BRASS WORKER can use them on Brass. Every WOOD WORKER can use them to gum his saws, to sharpen his planer knives, to make his moulding cutters. For illustrated circulars address The Tanite Co., Stroudsburg, Monroe county, Pa.

Varney's Patent Amalgamator.
These Machines Stand Unrivaled.
For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.
They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.
This Amalgamator Operates as Follows:
The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.
Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.
Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco.

Academy of Sciences.

The Academy held its regular semi-monthly meeting on the 1st inst. Messrs. John Williamson, Wm. Henry Knight, Eugene E. Dewey, Albert S. Evans and Thomas P. Madden were elected to membership and Col. E. Sparrow Purdy, now in Egypt, was elected a corresponding member.

A New Mineral.

Mr. T. E. Durand presented a description of a new mineral found by him in the new Almaden quicksilver mine. It is of a very bright pure yellow color, is found embedded iu crystalline silicious dolomite. It can be very easily separated from dolomite by sublimation. When warmed in a glass tube it volatilizes when it has become dark red, and gives a strong yellow sublimate which appears amorphous, but which, under the microscope, shows very fine needles like crystals. If heated very quickly it carbonizes and gives a residue of carbon and an empyreumatic odor. Strong acids have no influeuce upon it. When tried for sulphur or arsenic it furnishes no traces of their presence. This mineral is very likely a kind of volatile hydro-carbon, probably belonging to the class of idrialine. When treated by the ordinary dissolvents of carburetted compounds, oil of turpentine, alcohol and ether, it appears to be entirely insoluble. On some specimons of cinnabar from the Redington mine the same substance is found in small scales. In fact, all the characteristios show that the miueral is a new substance, and for it has been adopted the name, *Aragotite*.

About the Earthquake.

Mr. Hanks introduced to the academy Mr. A. C. Diggins, who was at Independence during the recent earthquakes. Mr. Diggins said that he had been interviewed by a reporter of the *Bulletin* and that he had little more to add to what had already been published. He was willing to answer any questions, however, as far as it was in his power. In answer to a number of questions by different members he stated that a rumbling souud was distinctly heard at Independence preceding each shock. The sounds were loud and rumbling, like a train of cars, or distant artillery. At first they seemed to come from the air, and then a rumbling directly under foot would follow. The shocks followed each other so rapidly that this rumbling under foot might have been the noise of the shock, and the sound which apparently came from the air might have been the precursor of the shock immediately to follow. Which sounds preceded and which followed the convnlsions could not be determined. The first shock came about half-past two in the morning. At four o'clock Mr. Diggins said he was in the stage traveling north. Wherever the stage stopped the passengers felt one or more shocks, and always heard that terrible sound accompanying the convulsion. They noticed it more particularly at Bishop Creek, 75 or 80 miles north of Lone Pine. At Independence, where he felt the first shocks, he was near mountains, and the inhabitants at first ascribed the sounds to the rolling of masses of rocks down the mountains. He noticed no peculiarity in the atmosphere the night preceding the shocks; it was a bright moonlight one. He mentioned having been told by a lady and gentleman, that they saw fire coming from the top of the mountains, and the next day there was a black streak down the side of the extinct volcano, which had never been noticed before.

Mr. Hanks gave a short description of the country with which he was familiar. Dr. Gibbons, Dr. Blake, Mr. Stearns and Dr. Hewston all made some remards on earthquakes in general.

Mr Hanks, in answer to a question, said the ouly experiment he had ever made with an earthquake indicator was to construct an arrangement similar to what, he had been informed, they used in China. He had been told that they suspended a steel weight from a magnet, and that just before an earthqnake the electricity of the atmosphere would cause the magnet to lose its power, the weight would drop, and, striking a gong, would give the people the alarm, so that they could escape into the street. He had constructed one on this principle, but it had passed through several earthquakes and had given no indication.

Paper Manufacture.

Dr. Gibbous exhibited a section of the cactus plant, a portion of which he said had been sent East that its qualities for the manufacture of paper might be tested. Some of the pulp made therefrom had been returned, with the statement that it was the very best material for paper. This production grows in great abundance in the southern counties of California.

Senator Cole's Land Bill.

An excellent bill for the protection of settlers on public lands was offered in the United States Senate by Mr. Cole, of this State, which was referred to the Committee on Public Lands, and ordered printed. Following is the full text of the bill:

SECTION 1. That every citizen now residing upon the public lands of the United States or who may hereafter settle upon such land, shall he held and deemed to be, in law, the owner of the same; *Provided, however*, that his or her possessions do not exceed in extent one hundred and sixty acres of agricultural land fitted for cultivation; or six hundred and forty acres of land if the same be useful for pasturage or timber only; or forty acres if the same be known as placer mining lands.

SEC. 2. That every person occupying the public lands of the United States, as provided in the preceding section, shall, after two years of actual continuous possession, if the same be agricultural or pasture lands, be entitled to a patent for the same from the United States free from all costs and charge whatsoever, and if timber land, or placer mining land, or other mineral land, at the rate or price now prescribed by law.

SEC. 3. That none of the public agricultural, pasture, timber or placer mining lands of the United States shall he disposed of otherwise than as in this act provided.

SEC. 4 That all agricultural, pasture, timber, mineral and other public lands of the United States, except reservations for Government purposes, whether surveyed hy the United States authorities, or unsurveyed, or whether offered by the Government or not, if the same remains uncovered by patent, shall be free and open to occupation and settlement, and shall be subject to the provisions of this act, any former act of Congress relating to the same to the contrary notwithstanding.

New Incorporations.

The following have filed certificates with the County Clerk, San Francisco:

NEWARK S. M. Co.—March 29. Location: Ely M. District, Lincoln county, Nevada. Capital stock, $3,200,000, in 32,200 shares. Trustees—Wm. Blanding, S. Heydenfelt, Jesse S. Wall, Jose E. De la Montanya, A. A. Young.

GAUDALUPE G. S. AND C. M. Co.—March 31. Location: Comondee District, Lower California. Capital stock, $200,000, in 20,000 shares. Trustees—H. H. Pearson, Edward Landers, John Wade, C. J. Hutchinson, and Wm. Williams.

KENTUCKY G. ANN S. M. Co.—March 31. Location: Lincoln county, Nev. Capital stock, $3,000,000, in 30,000 shares. Trustees—J. B. E. Cavallier, Alexander Austin, Richard O'Neill, E. J. Baldwin and Pierre G. Venard.

GWIN M. Co.—March 31. Location: Middle Bar District, Calaveras county. Capital stock, $2,000,000, in 20,000 shares. Trustees—W. M. Gwin, J. D. Fry, H. D. Bacon, A. K. P. Harmon and E. J. Coleman.

FREMONT M. AND M. Co.—March 31. Location: Drytown, Amador county. Capital stock, $2,500,000, in 50,000 shares. Trustees—Cyrus Wilson, John Tregloan, John S. Wilson, Levi H. and Mark T. Ashby.

BECKWITH M. Co.—April 2. Location: Kanaka Flat, Ely M. District. Capital stock, $2,000,000, in 20,000 shares. Trustees—Isaac Wormser, Charles Jones, George D. Roberts, J. M. Miner and L. Garstle.

ROCK ISLAND G. ANN S. M. Co.—April 3. Location: Storey county, Nevada. Capital stock, $2,400,000. Trustses--A. K. P. Harmon, A. E. Head, Joseph Clark, J. E. de la Montanyna, and B. Thornhurgh.

NORMON G. M. Co.—April 3. Location: Aqueduct District, Amador county. Capital stock, $1,250,000. Trustees—J. M. Thompson, W. G. Wayman, Benjamin Dore, M. D. Plummer and E. J. Moore.

The following have filed certificates of incorporation in the Secretary of State's office in Sacramento:

COTTONWOOD CREEK G. M. Co.—Location: Tehama county, Cal. Capital stock, $2,000,000; principal office in San Francisco. Trustees—S. M. Van Wyck, Wm. Welch, Geo. Rutledge, James L. and Parker Crittenden.

STERLING M. Co.—Location: Ely District, Nevada. Capital stock, $3,000,000; principal office in San Francisco. Trustees—J. D. Fry, P. J. Bradford, C. W. Fox, G. W. Beaver and R. R. Givens.

Meetings and Elections.

PACIFIC SILK MANUFACTORY.—On Friday, March 29th, the Trustees of the Union Pacific Silk Manufacturing Company, held their first meeting for the election of officers, when the following named gentlemen were appointed: C. W. H. Coney, President; R. A. Ruttcr, Vice President: J. D. Stewart, Secretary; W. C. Ralston, Treasurer; Joseph Warhurton, Superintendent and General Manager.

PHENIX S. M. Co.—At the annual election of the stockholders of the Phenix S. M. Co., the following persons were elected Trustees to serve for the ensuing year: Robert Sherwood, President; A. J. Ellis, H. F. Cutter, T. Wiswell, O. Livermore, and Joseph Maguire, Secretary.

FRANCIS M. Co.—At the annual stockholders' meeting of the Francis M. Co., the following Trustees were chosen for the ensuing year: Messrs. A. C. Peachy, President; Geo. D Roberts, J. W. Gashwiler, Richard Ivers and M. Mayblum. T. F. Cronise was elected Secretary.

JULIAN G. M. Co.—At a meeting of the Trustees of the Julian Gold M. Co., T. J. Poulterer was chosen President; M. Mayblum, Vice-Prcsident; Alex. Forbes, Treasurer; T. F. Cronise, Secretary.

BECKWORTH M. Co.—At a meeting of the Beckworth M. Co., the following officers were elected for the first three months: President, Charles Jones; Vice-President, G. D. Roberts; Secretary, W. H. Watson; Treasurer, Isaac Wormser.

From an Old Inventor.

MARYAVILLE, Cal., March 2, 1872.—Measrs. DEWEY & Co., U. S. and Foreign Patent Attorneys, San Francisco. My Patent, through your Agency, is received. Please accept my warmest thanks for the ahility you displayed n obtaining it. Thirty years experience in inventing and obtaining patents haa taught me the lesson that *that* patent agency is tbe cheapest whlch has the most ahility, integrity and energy; and without flattory, permit me to say that I have tried the most prominent patent agents of the Atlantic Coast, and have never had my work so ably done aa hy your firm. I have carefully reviewed the specifications and claims of my patent, and am unable to find an error, nor would I add a word or line thereto; yet it ia the most complicated and difficult invention to specify clearly that I over invented; still, your lucid specificationa and drawings so divest it of its apparent complication, that it may easily be understood by any one. Permit me to say, in conclusion, that the inventors of thia coast bave cause for just pride in the poasession of so able a medium as DEWEY & Co., through whicb they may obtain justice at the Patent Office.

10v3-1am3t Yours truly, S. PELTON.

A NEW BOOK ON MINING.

The Explorers', Miners' and Metallurgists' Companion; Compriaing a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy. The Most Practical and Comprehensive Work on Mining Subjects Extant. Comprising 640 Pages and 81 Engravings. By J. S. Phillips, M. E. Price, bound in cloth, $10 (in coin or its equivalent). In leather, $12. Postage, 50 cents extra. Issued and for sale by DEWEY & Co., Patent Agents and Publishers Scientlfic Press, S. F.

COMPLETE VOLUMES

Of the SCIENTIFIC PRESS can be bad from January 1, 1864, to date, at $3 per aingle vol. or $6 a year. They afford tbe cheapest and best information on mining and the industry of this coast of any work published.

RICHARD H. BUEL, Consulting Mechanical Engineer, 7 Warren Street, New York. Advice and assistance given to those who desire to invest funds in meritorious and valuable Patent Rights. Machinery of all kinds bought and sold. Unusual facilities for testing engines, boilers and other machinery. I refer particularly to Professor R. H. Thurston, of the Stevens Institute of Technology, who has consented to associate himself with me in consultation on matters of special importance. 10v24-13t

Owing to the time necessary to mail the present large edition of the Scientific Press we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Ingomar Silver Mining Company—Location of works, Ely Mining District, Lincoln County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 2d day of April, 1872, an assessment of 25 cents per share was levied upon the capital stock of said company, payable immediately, in U. S. gold coin, to the Secretary, at the office of the company, Room 21, Hayward's Building, 419 California street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on Wednesday, the 8th day of May, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Friday, the 31st day of May, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Trustees.

CHAS. S. NEAL, Secretary.

Office, Room 21, Hayward's Building, No 419 California street, San Francisco, California. ap6-4t

Marcelina Silver Mining Company.—Location of Works: Eureka District, Lander County, Nevada.

Notice is hereby given that at a meeting of the Board of Trustees of said company held on the eighth day of March, 1872, an assessment of ten cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, Room 21, Hayward's Building, 419 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the fifteenth day of April, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the seventh day of May, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

CHAS. E. ELLIOTT, Secretary.

Office, Room 21, Hayward's Building, 419 California street, San Francisco, California. mar19-3w

Nevada Land and Mining Company—

Location: Spruce Mountain, Antelope and Clifton Mining Districts, Elko County, State of Nevada

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 28th day of March, 1872, an assessment of four cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the Co.'s office, room 5, No. 302 Montgomery street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on Thursday the 2d day of May, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Friday the 24th day of May, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. H. WATSON, Secretary.

Office—Room 5, No. 302 Montgomery st., San Francisco, California. mar30-td

Nuestra Senora de Guadelupe Silver Mining Company.—Location of Works: Tayoltita, San Dimas District, Durango, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twelfth day of May, 1869, an assessment of two dollars per share was levied upon the assessable capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, E. J. Pfeiffer, No. 210 Post street, or to the Treasurer, A. Himmelmann, No. 637 Washington street, San Francisco, to settle the indebtedness of the said Company.

And whereas there has been an error in the course of proceedings for the collection of said Assessment, by reason of which, as provided by law, all previous proceedings, except the levying of the Assessment, are void, and publication required to be begun anew, NOW, therefore, by order of the Board of Trustees of said Company, at a meeting of said Trustees, held on the eighth day of March, 1872, said Assessment is hereby re-published, and notice thereof given as follows, to wit:

Nuestra Senora de Guadelupe Silver Mining Company.—Location of Works: Tayoltita, San Dimas District, Durango, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twelfth day of May, 1869, an assessment of two dollars per share was levied upon the assessable capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, E. J. Pfeiffer, No. 210 Post street, or to the Treasurer, A. Himmelmann, No. 637 Washington street, San Francisco, to settle the indebtedness of the said Company.

Any stock upon which said assessment shall remain unpaid on the fifteenth day of April, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the eighth day of May, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

E. J. PFEIFFER, Secretary.

Office, No. 210 Post street, San Francisco, California.

Ophir Copper, Silver and Gold M. Company—Location of Works, Ophir, Placer County, Cal.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 18th day of March, 1872, an assessment of twenty (20) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, N. E. Cor. Sansome and Halleck Sts., entrance on Halleck street, San Francisco. Any stock upon which said assessment shall remain unpaid on the 20th day of April, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 14th day of May, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

R. G. BRUSH, Secretary.

Office, N. E. Corner Sansome and Halleck Streets, S. F.

Quail Hill Mining and Water Company—

Location of works: Calaveras County, California.

NOTICE.—There are delinquent upon the following described stock, on amount of assessment levied on the 15th day of February, 1872, the several amounts set opposite the names of the respective shareholder as follows.

Names.	No. Certificate.	No. Shares.	Am't.
F. S. Spring, Trustee	44	120	600
E. F. Dennison	42	1	5
A E. Hill, Trustee	40	7	35
A. E. Hill, Trustee	39	1 0	60
A. E. Hill, Trustee	37	119	595
A. E. Richardson, Trustee	36	60	300
A. E. Hill, Trustee	31	50	250

And in accordance with law, and an order of the Board of Trustees, made on the 15th day of February, 1872, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, No. 409 California street, San Francisco, California, on the 16th day of April, 1872, at the hour of 12 o'clock M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale. T. F. CRONISE, Secretary.

Office, 409 California street, San Francisco, Cal. mar30-3t

Siempre Viva Silver Mining Co.—Location of works, District of Zaragoza, Sinaloa, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 26th day of March, 1872, an assessment of 25 cents per share was levied upon the capital stock of said company, payable immediately, in U. S. gold coin, to the Secretary, at the office of the company, No. 314 California street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on Thursday, the 2d day of May, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 20th day of May, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOHSE, Secretary.

Office, No. 314 California street, San Francisco, Cal.

PACIFIC BRIDGE COMPANY,

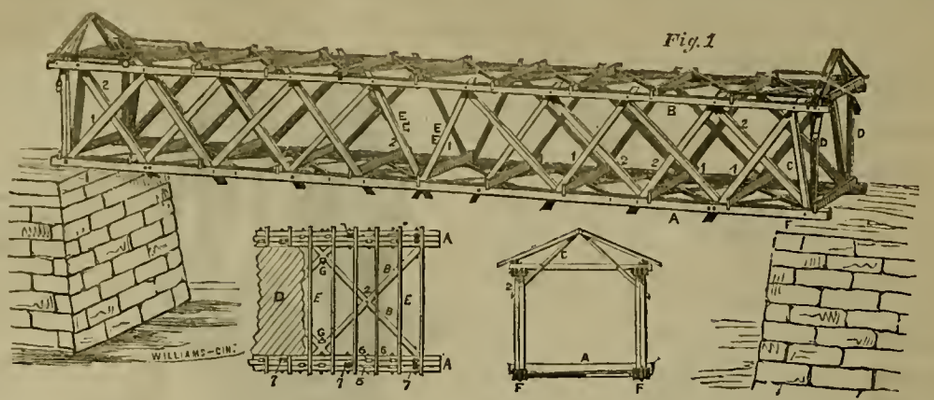

Fig. 1

OAKLAND, CAL.,

ARE PREPARED TO BUILD ALL KINDS OF WOODEN BRIDGES ON

Smith's Patent Truss Plan.

These Bridges have been thoroughly tested in the East for Three Years, and wherever tried have proved superior to any other Bridge in the following points:

Being built of wood entirely, they are not affected by change of temperature.

The timber used is placed so directly in the line of strain, that less material is required to support the same load.

It is not perceptibly affected by shrinkage. It is the most Economical Bridge built. It is adapted to any practicable LENGTH OF SPAN.

Plans, Specifications and Terms will be sent to any County, Township or Person wishing to build a Bridge, and no charge made unless the Plan is used. For all Public Bridges the Plan will always be open to competition.

Smith's celebrated CAST IRON PIER, economical, and adapted to heavy currents, built at low rates.

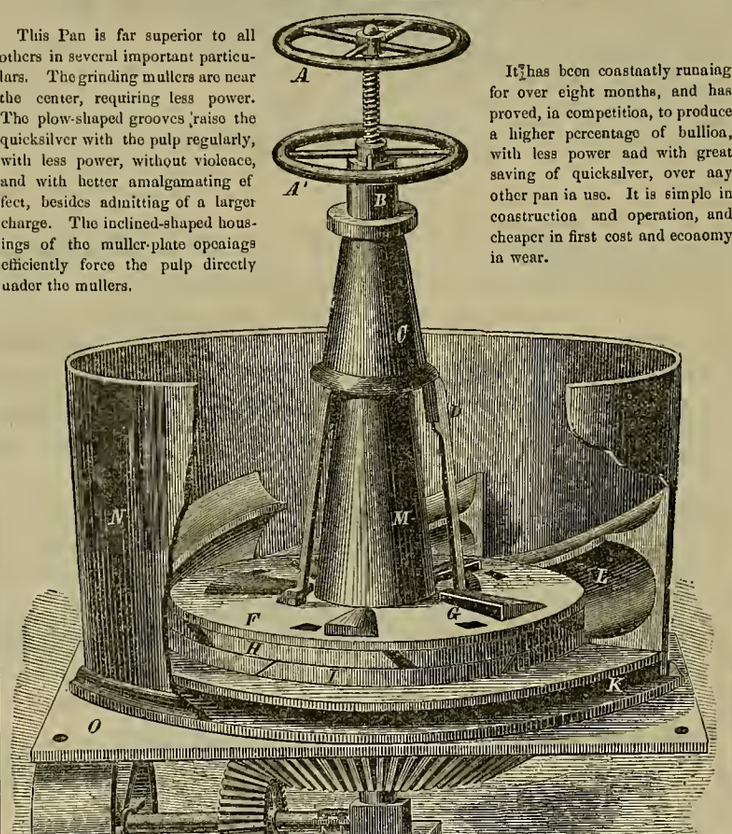
C. H. GORRILL, Secretary.

W. H. GORRILL, President.

STEVENSON'S PATENT MOULD BOARD AMALGAMATING PAN.

This Pan is far superior to all others in several important particulars. The grinding mullers are near the center, requiring less power. The plow-shaped grooves raise the quicksilver with the pulp regularly, with less power, without violence, and with better amalgamating effect, besides admitting of a larger charge. The inclined-shaped housings of the muller-plate openings efficiently force the pulp directly under the mullers.

It has been constantly running for over eight months, and has proved, in competition, to produce a higher percentage of bullion, with less power and with great saving of quicksilver, over any other pan in use. It is simple in construction and operation, and cheaper in first cost and economy in wear.



Manufactured at the Golden State Iron Works (Co-operative). 19 First street, S. F.

Where it can be examined and further particulars be learned; or persons may apply to the inventor and patentee, Mr. C. O. STEVENSON, at the Douglas Mine, GOLD HILL, STATE OF NEVADA, where the Pans have long been in constant operation. 15v20-1mr,1amtf

Pocahontas Gold Mining Company—Location of works, Mud Springs, El Dorado County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 26th day of February, 1872, an assessment of Five Dollars per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the office of the company, Room No. 26, Hayward's Building, No. 419 California street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on Saturday, the 6th day of April, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before will be sold on Monday, the 8th day of May, 1872, to pay the delinquent assessment thereon, together with costs of advertising and expenses of the sale.

D. A. JENNINGS, Secretary.

Office, Room No. 26, Hayward's Building, 419 California street, San Francisco, Cal.

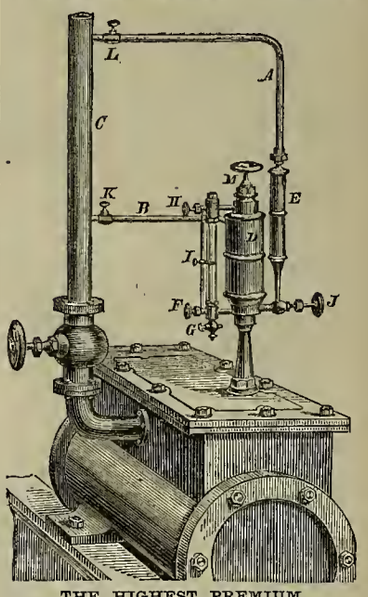
N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; l, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

BLAKE'S PATENT STEAM PUMPS.

WHAT IS SAID BY THOSE WHO USE THEM.

SALEM, Oregon, January 16th, 1872.

MESSRS. BERRY & PLACE, San Francisco—Gentlemen: In answer to your query regarding the working of the large Blake Steam Pump, our company purchased of you, we would say in all sincerity that the pump *has exceeded our expectation*. It has been in use since the 27th of September, 1871, and has thus far given the most perfect satisfaction. It does its work with ease, does not get out of order, and requires but little or no attention to run it. It is SIMPLE, DURABLE, and PERFECT in its construction. We have found it entirely satisfactory and just the pump *in every respect* needed for our work.

Yours, respectfully, W. F. BOOTHY, Pres't Salem Water Works.

PHŒNIX MINE, Napa County, January 10th, 1872.

MESSRS. BERRY & PLACE, San Francisco—Gentlemen: The No. 8, Blake Steam Pump we bought of you last fall is doing good service. We are having a large amount of water to contend with during this stormy weather; but the pump throws it all out of the main shaft (160 feet deep) with perfect ease, and is only working from 60 to 80 strokes a minute. It is a complete pump and no mistake. We are well satisfied with its working, and if you wish to use the name of our company, as a reference, you are at liberty to do so. Very resp'tly, GEO. FELLOWS, Supt. Phœnix Quicksilver M. Co.

OFFICE STARR MILLS, VALLEJO, Cal., January 13th, 1872.

MESSRS. BERRY & PLACE, San Francisco—Gentlemen: We are pleased to state that the No. 3 Blake Pump purchased of you, has constantly supplied our three boilers for the past year, with water heat to above boiling point with one of Armstrong's Patent Heaters. It has given us no trouble nor expense, and has in fact fully come up to your recommendations.

Yours, Etc., STARR BROS. & CAMPBELL.

OFFICE S. J. WOOLEN CO., SAN JOSE, January 29th, 1872.

MESSRS. BERRY & PLACE, San Francisco—Gentlemen: We have used a No. 6 Blake Steam Pump now for about two years, both as a Tank Pump and as a Fire Pump in case of need: and it has given excellent satisfaction. *It suits us in every respect.*

Very respectfully, R. F. PECKHAM, Pres't San Jose Woolen Co.

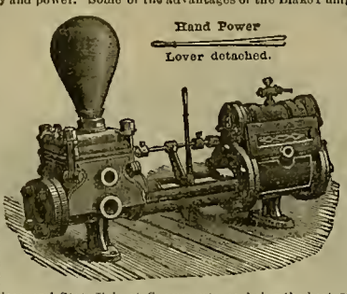
BELMONT, Cal., February 6th, 1872.

MESSRS. TREADWELL & CO.—Gentlemen: In reply to your inquiry concerning the large Blake Steam Pump, purchased of Berry & Place, by Mr. Ralston, I will say, that it gives ENTIRE *satisfaction*, even working as it now is, where no other Pump could; for it is *at present six feet under water*, yet it does its work PERFECTLY.

Yours, Etc., J. E. BUTLER, Supt. Water Works and Engineer at W. C. Ralston's.

BLAKE'S PATENT STEAM PUMP.

These Pumps have been tested, and found to be indisputably without an equal wherever tried. They have been sold in the Pacific States now for nearly three years, and we are willing every one in use may be referred to; every Pump will speak for itself. They are constructed in the most simple style, and built in the most thorough manner—especially calculated for simplicity, durability and power. Some of the advantages of the Blake Pump may be summed up as follows: It is positive under any pressure. May be run slow or fast as may be desired. Will discharge more water than any others of the same dimensions. Has no leaky joints, the steam part being cast in one entire piece. The steam valve is perfectly balanced, is cushioned at each end, and slides with the greatest facility *having no cams, nor complex rotary arrangements to get out of order.* Will start at any point of the stroke, and will discharge all the water of condensation. The Pump has no crank or fly-wheel, thereby saving a considerable item of expense to the purchaser. Having *no dead points*, it therefore needs no watching, and is consequently ready to start without using a starting bar or any hand work whatever. The Blake Pump is extensively used on Railroads and Steamboats, in Hotels; for Mining and Fire purposes; in Breweries, Tanneries, Sugar Houses, Factories, Mills, Laundries, and as Boiler Feeders, wherever steam is employed. In fact, wherever water or other liquids are desired to be raised in large or small quantities, or against heavy or light pressure, it is the cheapest and best Pump that can be used. It is offered to the public as the most perfect independent steam Pump ever invented. Forty different sizes are made, capable of throwing from 1,000 to 200,000 gallons an hour, and adapted to any class of work that may be required. Every pump will be warranted to perform the work required of it by the purchaser, or it may be returned and the money will be cheerfully refunded. The Blake Pump was awarded a silver Medal at the exhibition of the Mechanics' Institute, San Francisco, and State Fair at Sacramento, as being the best steam Pump on exhibition. The agents have recently imported several of the largest-sized Mining Pumps for water works, and deep mines, and will be pleased to refer parties to them; we claim for it, that it is the most simple and durable, and consequently the best Steam Pump ever built. For sale by TREADWELL & CO., Machinery Depot, old stand, corner of Market and Fremont streets, San Francisco, who will be pleased to send circulars to any address, or show its advantages to parties calling on them.



It has no Cams or Rotary Complex Valves. It has stood the test wherever tested.

IT IS SIMPLE, COMPACT, DURABLE, AND POWERFUL.

☞ Manufactured by Geo. F. Blake & Co., Boston, who build and have on hand a larger variety of Steam Pumps than any other concern in the country, embracing *forty* different sizes, and capable of throwing from 1,000 to 200,000 gallons an hour, and adapted to every description of work required. ☞ Send for circular and prices.

Designing and Engraving

By the Best of Artists, At this Office.

The Scientific Press is the Oldest and Largest Practical Mining Journal in America.

Established in 1860, this weekly has steadily advanced in size, ability and interest. Its chief editors and publishers have had over fifteen years successful experience in conductiug this and other journals in California.

Its editorials are carefully prepared with an honesty and accuracy that maintains its reputation as the best authority on mining matters in the country.

It is published in the best location in the world for furnishing the largest amount of valuable information to the gold and silver miners and metallurgists everywhere.

Its correspondents and subscribers are to be found in nearly all the mining districts of CALIFORNIA, NEVADA, IDAHO, MONTANA, UTAH, ARIZONA, COLORADO, and in MEXICO and other foreign countries.

Over 10,000,000 Dollars!

Have doubtless been saved to the miners of the Pacific Coast by reading this journal, each issue of which contains some two pages of MINING SUMMARY from the most important districts in the U. S.; from one to two pages concerning NEW INCORPORATIONS, SHARE MARKET, MINING CORRESPONDENCE, COMMUNICATIONS, etc., aud from two to three pages of EDITORIALS (with illustrations) of NEW MACHINERY, NEW DISCOVERIES, PROCESSES, and operations in MINING, MILLING, ROASTING of ORES, ASSAYING, etc.

One feature of our journal consists in presentiug in each issue a POPULAR VARIETY of highly interesting matter, useful and instructive for all intelligent readers, systematically arrauged in departments under headings entitled Mechanical Progress; Scientific Progress; Mechanical Hints; Home Industry; New Discovcries; Good Health; Domestic Ecouomy, etc., rendering its reading pleasant and profitable at the OFFICE, SHOP AND FIRESIDE.

Yearly subscription $4 per annum. Single copies 10 cents. Four sample copies (of recent dates) furuished for 25 cents. List of California mining books sent free. DEWEY & CO., Publishers, Patent Agents and Engravers, No. 338 Montgomery street, Sau Fraucisco.

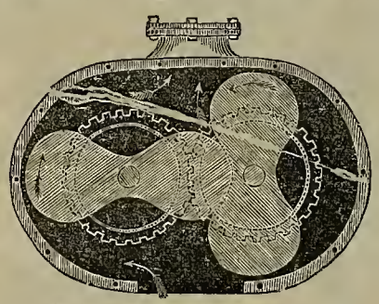
ROOT'S PATENT FORCE BLAST ROTARY BLOWER,



[Sectional view showing the pistons and gearing.]

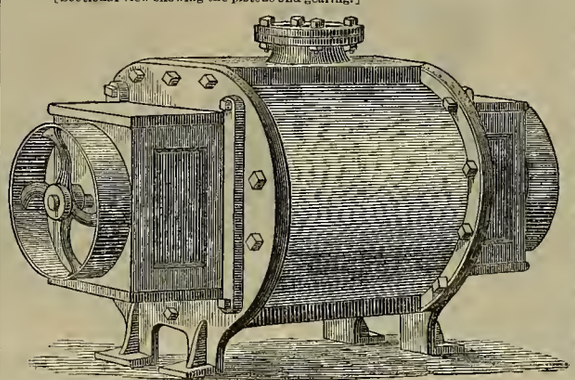
MANUFACTURED AT THE

GLOBE IRON WORKS,

Stockton, Cal.

Awarded the First Premium at the Paris Exposition.—Patented November 1, 1864; July 24, 1866; and October 9, 1866.

Adapted for Smelting, Foundry, Mining and Steamships. Requires 50 Per Cent. less power than any Blower now in use.



One of these Blowers may he seen at W. T. Garratt & Co.'s Brass Foundry, San Francisco; Gould & Curry and Savage S. M. Co.'s, Nevada; and at C. P. R. R. Co.'s Works, Sacramento; and other places on this cosst.

CAUTION. — Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article. Quartz, Saw and Grist Mill, Iron, Stationary and Steamboat Engines, Horse-Power and Pumps, of all Sizes.

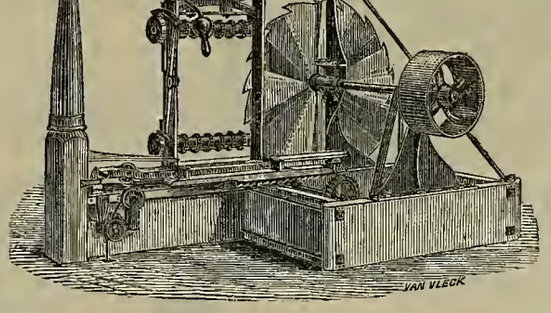
For Circulars and further information, Address

4v24tf GLOBE IRON WORKS, STOCKTON, CAL.

Huntington's Improved Shingle Machine.

PATENTED DECEMBER 7, 1870.

MANUFACTURED AND FOR SALE BY F. A. HUNTINGTON, Nos. 18 and 20 Fremont Street, SAN FRANCISCO.



FOR SIMPLICITY, DURABILITY AND RAPIDITY OF action, these Machines have no equal, cutting from 3,500 to 4,000 per hour. They are now used by all the principal Millmen on the Pacific Coast.

These Machines are in use at the Mills owned by the following parties: Macpherson & Wetherbee, San Francisco; Pope & Talbot, San Francisco; Hanson & Co., Redwood City; Rice & Haliburton, Woodside; S. P. Pharis, Woodside; Harrington & Co., Pescadero; Burch & Co., Pescadero; A. Saunders, Point Arena.

Steam Engines, Sawmills, Planing, Lath and Picket Machines, etc., made to order, at short notice.

IMPORTANT MINING BOOK.

Mines, Mills, and Furnaces of the Pacific States and Territories; An Account of the Condition, Resources, and Methods of the Mining and Metallurgical Industry in those Regions, Chiefly Relating to the Precious Metals. By Rossiter W. Raymond, Ph. D., Vice-President Am. Inst. of Mining Engineers; Editor "Engineering and Mining Journal." Author of "Mines of the West," "American Mines and Mining," etc. J. B. Ford & Co., 1 vol. 8vo. 458 pp. Extra Cloth. Sold by DEWEY & Co., publishers Scientific Press, San Francisco, at publishers' rates, $3.50. This volume will scarcely need to be recommended to those who are acquainted with the "Mines of the West," "American Mines and Mining," and other professional publications of its author. The present work is in no sense a repetition of Mr. Raymond's former ones. It contains a full and comprehensive account of the condition of the gold and silver mining industry of the United States, with practical recommendations of great importance to those engaged in it. The chapter on the treatment of auriferous ores in Colorado is the best account of the stamp-mill process ever published in this country; and the general discussion of smelting processes for silver ores supplies an instant want. The series of volumes, of which this forms the third, which have proceeded from the rapid but careful pen of Commissioner Raymond, are recognized in this country and in Europe as professionally authoritative and popularly interesting to a remarkable degree. To be technically accurate, but not technically abstruse, is their salient and acknowledged merit.

SCIENTIFIC PRESS.

AN ILLUSTRATED JOURNAL OF SCIENTIFIC AND INDUSTRIAL PROGRESS,

Mining, Mechanic Arts and Inventions.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, APRIL 13, 1872.

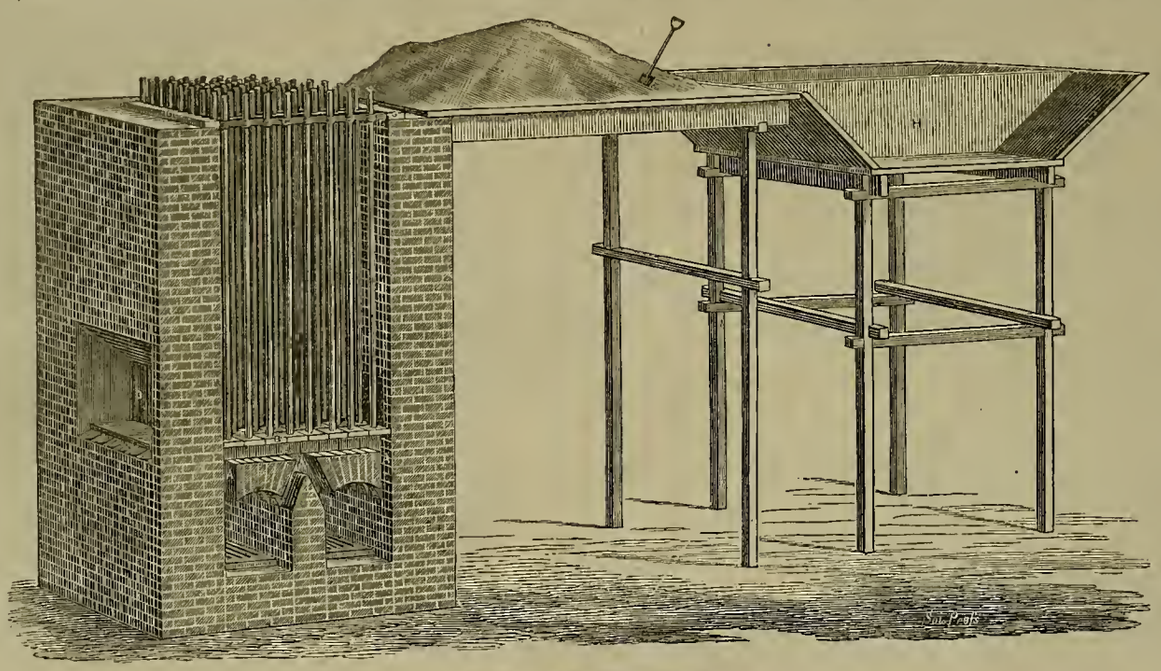
VOLUME XXIV. Number 15.

Improved Furnace for Roasting and Chloridizing Crushed Ores in Bulk.

Onr illustration represents a sectional view of an improved furnace for roasting metallic ores to be nsed in connection with an improved proccss for so doing, hy the same inventor. The peculiarity of the invention consists in opening passages for the circnlation of the heat and gascs needed in the reduction and purification of metallic ores, throughout a mass of pulverized ore, in the reducing chamber of a furnace, to facilitate and insnre its speedy desulphurization and reduction. In roasting pulverized ores, heretofore. difficulty has heen experienced from the fact, that owing to the fineness of the particles, the ore when in mass packs so closely as to prevent a draught and passage of heat; and of the reducing gases through the eame. To obviate this difficulty various expedients have heen resorted to, sueh as moulding the ore into bricke or balls, preparatory to suhmitting the same to the action of the fire; sifting the ore through cnrrents of flame and gascs, etc., all of which have proveu to be tedious and expensive in their nature. The ohject sought for in this invention is to provide a simple, cheap and effective method of roasting and chloridizing gold and silver ores *in bulk*, and is specially dcsigned for ores, slimes and tailings that have been wet crushed. To effect this by any other means now in vogue requires that the ore shall he firet dried and re-pulverized, an expense that few ores of that class can hear.

The furnace, as the cut shows, is substantially a large rectangular ore chamber with ordinary fireplaces underneath, the fines, *A A*, from which lead directly under the fleor of the chamber containing the ore. This floor, *B*, is constructed of tiles ahout six inches square, each one having a two-inch hole in its center so as to allow the heat and flames te pass from the fire helow to the ore chamber—above. A number of round wooden poles—two inches in diameter, to fit into the holes in the tiles of the floor, are made sufficiently long to permit their upper ends to extend above the fnrnace. They are secnred in position en tep hy light hoop iron guides, *C*, fastened to a frame work, *G G*, on the side eo that the whole can he lifted np in one piece when the poles are to he removed.

To prepare the furnace for a charge of ore, the first step is to place the wooden rods in an upright position, the lower ends being in the holes in the tiles and the upper secured by the guides. When the rods are all in, the side doors, *D*, are closed, and the furnace is ready for work. The tiles, *B*, of the floor are laid on fire-brick set on edge, *E E*, and they in tnrn are eet on the fire-arch. On each side of each fire-arch are a series of flues, *A A*, which permit the heat and flame to pass up through the floor into the chamber ahove. The grate bars and doors are constructed in the ordinary manner. A staging is erected heside the furnace npon which is a floer, *I*, connecting it with the settling tanks, *H*, and providing a convenient place to charge the furnace. This, however, would he unnecessary when the furnace could he erected beside a hill. The ore is run into settling tanks at a convenient distance from the furnace and then thrown on to the mixing floor.



CROSBY'S IMPROVED FURNACE.

Chopped hay or straw or any hollow vegetahle matter (straw is preferable) cut into lengths of from two to three inches, is thoroughly mixed with the ore, with a proportion of salt according to the charac- of the ore. The furnace being prepared as above described, the mixed ore is shevelled into the ore chamber so as to fill it nearly to the top. The charge is left as loose as possihle and no tamping done. The upper surface should he somewhat smoothed and levelled down, the guides removed, the poles drawn and the fire started. The wet pulvorized ore is of euch consistency that it packs closely in the chamher above tho upright rods and will not crnmhle. When the rods are withdrawn and the fire started it penetrates through the passagce left by their withdrawal, reaches the straw or fibrous material, speedily consuming it, and opening thousand of new passagee for the flame, heat and gas. This produces an exceedingly porous condition in the mass which is favorable to the speedy and effective action of the agents for its decomposition and reduction.

The proportion of straw which is found to work the best is 20 to 30 pounds to the ton of ore; the amount of salt will vary, with silver ores, from one to three per cent.; in good ores of course no salt is used. The charge can be quite wet, hut is hest when hut little moister than molder's sand. In silver ores the salt is hrought into direct contact with the ore and a more perfect chlorination is reached with a much less quantity than by other methods.

The cost of a 20-ton furnace of this description will vary from $400 to $800, exclusive of the right of use, according to locality. The lining of the fire hoxes with the arch and floor of the chamher should be of fire hrick hut the rest of the furnace can be made of almost any kind of etone or common brick. No iron work is necessary except grate hars and doers and the light guide frames. The furnace may be made of almost any capacity, but experience has ehown that those capahle of treating from 20 to 30 tons of ore at a charge are the most convenient to operate. Where there are two or more fnrnaces near each other one set of guides and polos will answer fer all. The furnace is ee cheap as to he within the reach of all, and can bo built in any locality with materials always at hand, as with careful usage common brick will do instead of fire-hrick. No power is required and any mason can erect it. This precess is now in no sense an experiment, it having been thoroughly and practically tested heth in Northern Nevada and Colorado. It was tried also for some time at the mines in Nerth Carolina, and is said to have worked well. Parties wishing further information concerning it can address the inventor, F. W. Croshy, Georgetown, Colorado, or Messrs. Taft and Smeeton, Ophir City, U. T. Col. C. S. Drew, 728 Howard St., in this city, is agent for California.

EASTERN SENSATIONALISM.—Our Eastern eotemperaries are circnlating nnwarranted reports with regard to the late Inyo earthquakes, such as leave the impression on distant readers that the entire State was severely shaken, when the fact wae eorrectly telegraphed from this city that the eeverity of the "tremhlor" was confined to a comparatively limited region, in a distant and thinly peopled portion of the State. With the exception of a natural sympathy in behalf of the Inyo sufferers, who were intimately connected in business and personal relations with our citizens, no more thought was given the earthquake in this city, or indeed throughout nineteen-twentieths of the State than though it had occurred in South America.

DETERIORATION OF WHEAT LANDS.—Russia seems to he following in the footsteps of this country in the neglect of her wheat lands, and, as a consequence, complainte are already being made that the average yield of her grain crops is constantly growing less. It is said that there, as in California, valuahle farm yard manure is, in many places, being conducted to the nearest waste gronnd or stream as a nuisance. Still, Russia is huying largely of reaping and threshing machines, netwithstanding, as well as ether agricultural machiuery, on a large scale.

BUSINESS neglected is business loet.

CORRESPONDENCE.

Notes of Travel in Placer County.

[By our Traveling Correspondent.]

Placer county, in proportion to its length, is the narrowest one in the State, being 80 miles long east and west, and having an average width of but 14 miles, containing about 1,120 square miles. Its county seat, Auburn, of which I will speak more fully in my next letter, is situated near the centre of the county, and about 150 miles distant from your city by rail. The lower part of the county is nearly at a level with tide water and the upper end is high up among the Sierras where the snow sometimes lies the year round. This being the case of course there is a variety of climate; the weather being mild and spring like in the western part and mild and pleasant in the center, while the eastern sections are hurled in snow and swept by furious storms.

It is traversed from south to north by one of the most extensive

Deep Channel

Auriferous gravel leads in the known world, commencing in the south at Todd's Valley and extending northward through Yaukee Jims, Wisconsin Hill, Iowa Hill, Indiana Hill and Gold Run. The channel at the latter point bears northeast to Dutch Flat, a distance of four miles, makes a short horse-shoe curve and turns directly to the westward, leaving the county at Little York a distance of three miles. The wash gravel along the entire channel is not only traceable, but pays to wash by hydraulic process, from one-half to three-quarters of a mile in width; the channel proper being from 100 to 800 feet in width, and the deposit from 75 to 500 feet deep.

Dutch Flat,

The largest town in the county, and most active mining camp on this gravel lead, is located one mile north from the railroad station bearing the same name, distance from your city about 200 miles, and about 35 miles a little north of east of the county seat, Auburn. It contains about 1,500 inhabitants. While mining is the chief occupation of its inhabitants, its lumber interests are second to none in the State. The Towle Bros. and Messrs Towle & Blanchard are the principal dealers in this line. These firms own, combined, 3 steam saw-mills situated severally, 3, 5 and 8 miles distant northeast, each of which is driven by steam with engines of from 20 to 40 horse-power. The largest has a capacity for making 27,000 feet of lumber per day, and the two smaller 15,000 feet each. The principal offices are situated at this place. Between these firms there is sold 9,000,000 feet of lumber annually, varying in price from $14 to $35 per thousand. The Towle Bros. also carry on an extensive manufacture of doors, windows, blinds, dressed flooring and all kinds of lumber for building and manufacturing material. The factory is situated in the suburbs of Dutch Flat. The principal interest in as extensive a mining section as this, is its water and water ditches, and the

Dutch Flat Water Co.,

The principal office of which is located here, is among the most important of its kind in the State. The company's ditches consist of the Placer county canal 30 miles long, and Cañon Creek and Little Bear River Ditches about 30 miles more, including other ditches leading to resevoirs, all of which center at Dutch Flat and Gold Run, and have a capacity of furnishing daily 5,500 inches for 24 hours run. This company own 12 resevoirs, the largest of which will furnish the above mentioned amount of water for one week, and all combined will furnish 30 days water without a drop running into them. The furthest point in an air line to where the water is taken up for these ditches is 25 miles easterly. This extensive enterprise is owned by E. L. Bradley and M. S. Gardner. The number of men engaged in the different departments is 13.

The water generally lasts from the middle of December to the middle of August, or from 6 to 8 months. It is reduced at the latter end of the season from August to December to about 100 inches. The company is at present disposing of from 3,500 inches of water per day up to their full capacity. Prices received for the same are 9 cents per inch for 12-hour water or 15 cents for 24-hour water. The measure is counted from the center of the issue with 7-inch pressure.

Summit Mining Co.

Leaving Little York, and going eastward, the first claim is that of the Summit Mining Co., situated 1¼ miles west by south from Dutch Flat. This company's possessions cover an area of 50 acres of mining ground and 190 more of timber land, all of which is covered by United States patent, the first ever granted to a gravel mining claim under the law of Congress. It is owned by eight equal partners, viz.: L. B. Tillotson, Chas. Voight, J. H. LaKamp, Wm. and John Rablin, Frank Sachs, W. T. Odgers and a Mr. Bailey. John Rablin is superintendent and Chas. Voight is secretary. The improvements consist of 1½ miles of 14-inch pipe and 600 feet of 4-foot flume 2 feet deep, with 5 undercurrents; the claim is better located for using the latter than any other on the flat. Working two of Hoskin's Little Giant monitors, with 3¼ and 4-inch nozzles, running 350 inches of water under 175-feet pressure; 125 feet more pressure will be added to this after the first of next month. Four hundred feet fall is had from their flume to the lowest undercurrent and 200 feet more of dump is obtained from there to Bear river where the tailings fall. This claim is one of the few that is being cleaned to the bed-rock as they go along, and the profits are satisfying to its proprietors. Still going eastward we meet a number of

Other Gravel Claims,

The first of which is known as the Kidder claim, consisting of about 10 acres of ground, located on the south side of Dutch Flat Cañon.

Jehosaphat claim comes next and is owned by the Dutch Flat Water Co. and H. C. Kelsey. This claim consists of about 15 acres of mining ground working regularly 4 or 5 men and two monitors.

Palmtag claim, next in order, is owned by the gentleman after whom it is named, who is working three men and using one monitor.

C. Straube's claim is an excellent claim containing 27 acres, working 3 men and one Little Giant monitor.

The Chinese Claim, called the American, is owned and worked by Chinamen. They own 12 acres of mining ground and employ regularly from 5 to 6 men and run one monitor.

Dutch Flat Blue Gravel Mining Co.

The principal office of the above named company is 401 California street, San Francisco. L. A. Booth is President and Geo. D. Roberts, J. B. Haggin, W. H. Raymond and E. B. Dorsey are its present Board of Trustees. The latter is Superintendent. This is an incorporation with 40,000 shares and $4,000,000 capital. The company's possessions consist of 27 acres of mining ground, covered by United States Patent. The water used is purchased of the Yuba Ditch Co., and they are at present running 2,000 inches through two 6-inch nozzles, of Hoskins Little Giant monitors, under a pressure of 400 feet, and by the time this is in type will be running under a pressure of 460 feet. Two more 8-inch nozzle monitors have been ordered, through each of which they expect to use 2,000 inches of water. In addition, their improvements consist of 2,500 feet of 30-inch pipe and 1,500 feet of tail flume 5 feet wide and two feet deep, with three under currents. They employ about 70 men. This is the largest enterprise in the State and they are at present using more water than any similar claim in the country. Several important blasts have lately been put off in this claim in one of which 700 kegs of powder were used; 14 chambers were drifted for the purpose, and it was fired by electricity. Using at present both black and Giant powder. This company have in project a bed-rock tunnel 1,500 feet in length for which they have ordered a "Diamond Drill." Up to the time of my visit to this mine, since being opened so systematically by its present owners, no clean-up has been made. It is not, however, to be supposed that an extensive clean-up could be made when they have only been washing top dirt, but the ultimate success of this mine is only a matter of time, for when it is thoroughly opened it will surely pay handsome dividends. The bed-rock under the principal portion of the channel in this claim has never been reached but they have a known depth of gravel of 150 feet, and the top gravel is 2,000 feet wide.

Columbia Gravel Claim, owned by Simons & Co., is the next adjoining the above and consists of 10 acres of mining ground where they are working 4 men with 2 Little Giant monitors. The claim is paying satisfactorially.

Gold Run,

Located four miles nearly west of Dutch Flat on the line of the Central Pacific Railroad, contains about 800 inhabitants and is now one of the busy mining towns of this county. Surrounding the town are a larger number of paying claims now working than at any other camp in the county. Beginning at the most southerly of these claims distant 1¼ miles southeast of the village is the Cement Mill Co. The company's possessions consist of a bed of hard cement 1,600x400 feet, and 9 feet thick. In their improvements is comprised an 8-stamp mill, run by water power which can crush about 40 tons per day, and which is now running to its full capacity. The average pay is about $4 per ton. They are at present engaged in drifting in a breast 100 feet wide, and are in 400 feet. Benches are left to support the mass above and but very little timbering is done. Working on an average 20 men. The claim is owned by 8 equal partners of whom John N. Jensen is Superintendent. The next claim passing northerly is the

Stewart & Sneff,

A rim rock claim, owned by gentlemen of the same name, which is nearly worked out except some back bottom gravel that will not at present pay to work. They are using one of Hoskin's monitors. After one more run of 30 days this claim will temporarily be laid up. It has paid its owners satisfactorily.

The Brink's and Hawkin's claims are the next two met in passing in the same direction and adjoining the above on the northeast. They are not at present working but are considered good claims in this vicinity.

The Indiana Hill Claim,

Owned by Judd, Brown & Miner, is a very extensive claim of about 40 acres, situated right on the channel adjoining the above. It is at present being vigorously worked, using two monitors, running 500 inches of water, and working 6 men night and day. It pays as well as any mine in the vicinity.

Gold Run Hydraulic M. Co. (Limited).

The property owned by this company was formerly known as the "Cedar Claim" and consists of about 37 acres in the heart of this mining section, the channel running the entire length of it. A deeper deposit of blue gravel is found here, probably, than at any other point on this celebrated channel. This property has recently been purchased by an English Co. for the sum of $60,000; the principal office is in London. O. S. Kipp is general superintendent. This company own no ditches but are purchasing their water for hydraulic purposes. Their improvements consist of about 1,400 feet of flume 4 feet wide by 2 feet deep, blocked the entire length. The flume has a grade of 8 inches to 12 feet. They also have 1,500 ft. of 16-inch pipe and the same amount of 11-inch pipe; working two Little Giant monitors with 4 and 5-inch nozzlee using 500 inches of water under a pressure of 240 feet. Their present working is at least 125 feet above bed-rock with a bank of gravel above and facing them 215 feet high. The northwest line of this company's claims is within ¾ of a mile of Gold Run station. Six men are employed night and day. The average yield for 30 days' run has been from $6,000 to $8,000. A sufficient amount of pay gravel is in sight in this claim to last for the next 25 years with the present method of washing.

Gold Run Mining Claim,

Located about one mile east of Gold Run station and adjoining the above on the north-east is owned by E. L. Bradley and W. H. Kinder. H. C. Kelsey is the present superintendent and lessee. The claim consists of 40 acres of mining ground on the main channel and their improvements are 650 feet of bed-rock tunnel that cost $30 per foot to construct; also 1,300 feet of bed-rock flume (being doubled through the tunnel) 4 feet wide by two feet deep. They have 1,600 feet of 30-inch, and 900 feet of 16-inch pipe. Working two of Hoskin's Little Giant monitors of 3¼ and 4 inch nozzles, lead pipes 11 inches in diameter, carrying 640 inches of water under 325 feet pressure. Working regularly 12 men night and day. The bank of pay gravel at present facing them is 130 feet high and fully 150 feet above bed rock; average receipts $6.000 per month. Making semi-monthly runs. There are a number of

Other Claims,

All of which are considered first-class, and most of which are at present working, as follows: Sherman, owned by Fitzpatrick; Newark, owned by Miners' Ditch Co.; Tayler & Harriman's; Frank Sach's; Beale & Co.'s and the Hawkins', all of which are extensive claims. The following are owned by the Dutch Flat Water Co.; Gold Run, Golden Gate, Union, Pacific, Ellison, Gem, Schuylkill and Central, all of which are extensive and most of them being worked with good profit. From Colfax and Auburn in my next.

L. P. Mc.

Sales of Mining Interests Unconstitutional.

Yesterday morning, Judge Reardan decided the case of Cullovin vs. Morarity, involving the constitutionality of the law passed by the Legislature concerning "mining partnership." The law provided that when owners of a mining claim desired to develop their claims, they could by notice call a meeting, levy an assessment, and afterwards, if the assessments were not paid, sell the interest of the delinquent according to the terms of the law. In this case the plaintiff, Cullovin, was sold out and he brought suit by his attorney, W. W. Cross, for possession of the ground. The defendant, by his attorneys, Williams & Johnson, answered, setting up as a defence, the assessment and sale under the law above alluded to. Mr. Cross moved the Court to strike out this defense on the ground that it was unconstitutional. The regularity of the proceedings for assessment and sale were not questioned, the motion resting entirely upon the questioner of the constutionality of the law. The case was argued on Saturday, by Mr. Cross, in favor of the motion, and Mr. Williams in opposition. Yesterday morning Judge Reardan rendered his decision sustaining the position of Mr. Cross. He held the law to be in contravention of the part of the constitution, providing "no person shall be deprived of life, liberty, without due process of law," holding that the latter phrase meant a suit and judgment of a court of competent jurisdiction. As a number of sales have been made in this and other mining counties of the State, under the law, the decision has an important bearing upon the interests of parties. We have not learned whether this case will be taken to the Supreme Court or not.—*Nevada Transcript.*

Wonderful Railway Bridge.

The Wallkill Valley Railroad bridge at Rosendale, Ulster county, deserves to be placed among the wonders of railroad construction. It is built across a deep gorge in the Shawangunk Mountains, in which lies the romantic village of Rosendale, and through which sweeps the Rondout creek. The immense chasm lay directly in the route of the surveyors, when the line was run, and there was no possible way to get around it, and the gigantic task of bridging it was commenced. The Western Manufacturing Company, of Paterson, was awarded the contract for the superstructure, and A. L. Dolhy & Co. the excavation and abutments. Work was commenced on the abutments in the fall of 1870, but owing to the prevalence of quicksand in the excavation, it was a year before everything was in readiness for the superstructure. It was completed in January last, nearly a hundred men having been steadily employed on it during that time. The bridge is a diagonal truss, Post's patent. There are three iron spans and two wooden ones. The entire length of the bridge is 987 feet, the iron spans being 876 feet, and each of the wooden ones 56 It is 150 feet above the Rondout creek. In putting up the iron work 300,000 feet of timber were used, it being necessary to put it up for each span at a time. One thousand tons of iron were used in the construction, and its supporting capacity is 4,000 pounds to the lineal foot. For the stringers, cross-pieces, etc., 120,000 pieces of timber were required. The structure is the highest span bridge in the United States. It cost $125,000. The rails will be laid over it next month. —*N. Y. Times.*

Preserving Fruit and Flowers.—Dr. Piesse has recommended preserving fruit and flowers by simply emersing in melted paraffine and withdrawing quickly, when a thin coat of paraffine instantly sets and closes all the pores of the plants thus treated. The paraffine should not be hotter than just sufficient to liquefy it; and the flowers should be dipped in separately (held by the stalk) and moved about in order to get rid of air bubbles.

Miners and Mechanics, write for your paper.

MECHANICAL PROGRESS.

Petroleum as Fuel in Iron Manufacture.

Much attention has been drawn to experiments with petrolenm in iron-making for some months past in progress in the La Clede Mills, St. Louis. No reliable data are afforded concerning the smelting of ores, but the reanlts in converting pig into bar and malleable iron are said to be good. We qnote the *Pittsburgh Commercial*:

One of the tests—all of which are said to have been of the most thorough character—employed to ascertain the effect of petroleum heat, consisted in puddling 1,000 pounds of pig-iron, smelted with raw Illinois coal in 1859, and which, owing to the large debasement by sulphur, had been thrown aside as worthless. Frequent efforts have been made from time to time to reduce the mixture to merchantable iron, but to no avail. Since 1864 it had lain neglected. A single hour's treatment with liquid gas, however, is said to have turned the mass out in the shape of iron of the finest quality, closely resembling steel, and perfectly free from sulphur and all other impurities. Specimens were exhibited, and were pronounced by old iron men as of the very finest quality of metal, equal if not superior to the best charcoal iron.

Other experiments are said to have demonstrated that common Iron Mountain pig-iron could, by a single application of the liquid fuel in the puddling furnaces, ha made into the best flange boiler iron, which, under the severest tests, was shown to be eqnal to the first quality Sligo or Low Moor iron, a range of capacity which is reported to have astonished even the most sanguine believers in the patent.

It is asserted that the iron manufactured by using this fuel has been tested in almost every conceivable manner, and that these tests prove its tensile strength as well as its capacity to anstain weight to be far above the average; in the former showing a tensile strength of more than 1,000 pounds greater than specimens of Low Moore iron. The workmen in the mill are said to be greatly interested in the experiments. They recently satisfied their curiosity by rolling this iron in sheets, and thongh still experimenting, have produced sheets so thin that five hnndred of them are but one inch thick. These sheets are described as being remarkably tough and flexible. Numerous other experiments are also reported to have been made, with only temporary machinery and apparatns for the nse of petroleum fnel, but with the most satisfactory results.

From these experiments it would appear to be considerably cheaper than coal in its use and handling, so far as the heating of the iron for the rolls is concerned, while the saving in 'scrapping' gives it a still further economic advantage, as the following results obtained in the acrapping furnace show:—

Iron placed in the furnace	7,950 lbs.
Iron taken out	7,761 lbs.
Showing a loss of	199 lbs.
Loss with coal 15 per cent. on	1,192 lbs.
Deduct loss with liquid fuel	199 lbs.
Saving with liquid fuel	993 lbs.

"Although petrolenm is generally known to be a concentration or distillation of coal, and that in proportion to the crudity of the coal to the concentrated character of the petroleum is the intensity of the heat produced by the petroleum greater than the heat of the coal, yet this seems to be the first definite and sustained attempt to apply the greater intensity to practical uses, aud to employ it as a refined mechanical force.

Heretofore, coal has been the main aliment of industry, and such is its importance and valne throughout the civilized world, that any material which supersedes it in cheapness and importance in the more essential uses of industry aud commerce, must necessarially be an agency of incalculable value, and work a corresponding revolution in the development of the resources of the country and their adaptation to the requirements of civilization and the interests of man. As to the snpply of the new fuel, so as to render its use a question for economy, there need be no alarm, for the quantity of it in many parts of the world seems to be inexhaustible and easy of access, and especially is this the case in our own country. Should the claims which are made in its behalf be substantiated by further experiments and investigations, it will probably work an eventful revolution, not only in the manufacture of iron, but wherever heat, steam, or artificial light are employed.

Labor-Saving Machines.—The beneficial effect of labor-saving machines in improving the conditiou of workmen, it is stated, has been exemplified by the application of the sewing machine to the manufactnre of shoes. The workmen of Lynu, Masa., who in 1862 were earning ten dollara a week without the assistance of the leather aewing machine, are now, it is reported, earning fifty dollars a week with the aid of thia useful apparatus. The inventor, who in 1862 was threatened with mob violence, is now considered by the workmen as their greatest benefactor. Within the last ten yeara the town of Lynn haa doubled in population and taxable property, and it is estimated that forty-four millions dollara have been saved to the whole country by the invention of the aewing machine aa applied to the manufacture of articles of leather.—*Public Ledger.*

High-Speed Engines.

F. A. P. Barnard, President of tha American Institute has recently made an elaborate investigation of a high-speed Alleu engine, the resnlts of which we find given in the New York *Engineering and Mining Journal* as follows:

High velocities and considerable weight in the reciprocating parts of cylinder steam engines, working expansively, are advantageons in the following particulars:

First, in distributing the work dono with a near approach to uniformity over the circumference described by the crank in its revolutiou; and secondly, in greatly reducing the irregnlarities of strain experienced by the working parts of the engine, especially as it respects the torsion of the shaft.

Tho advantage derivable from the use of heavy pistons increases with increase of weight only up to a certain point and is dependent on the initial pressure of the steam in the cylinder, on the point of the stroke at which cut-off is made, and on the velocity of revolution.

A high speed, heavy piston engine, depends, like every other reciprocating engine, upon the inertia of its fly-wheel or other rotating parts for the facility with which it passes the centers, but it taxes these regulators less than the ordinary reciprocating engine, becanse of the brevity of the intervals during which the effective force intermits. There must be at the beginning of the stroke a large excess of steam pressnre above that which is required to overcome the inertia of the piston, and impart to it the necessary acceleration; otherwise the advantages derivable from this constructiou and mode of working will not be fully secured, and the irregularity of working of the engine may even be exagerated.

The counterpoise weight employed to balance the strain exerted toward the close of the stroke by the heavy piston upon the crank, ought not to exceed one half the weight of the reciprocating mass to which it is opposed; otherwise, immediately after the passage of the centers, the strain on the main shaft in the direction opposite the crank will be excessive, and may be injurious.

Improved Canal Boat.—The first iron canal boat made in this country, or in the world, is now being built at the Continental Works, Green Point, N. Y. The boat is constructed on what is known as the longitudinal and transverse plan, with water-bottom divided by the framing into water-tight compartments. She has three entire hulkheads, dividing the machinery, cargo, and cabin spaces from each other. The boat is especially designed to carry grain, and has a cargo capacity of 200 tons of wheat. It is being built for the Fowler Improved Steam Propeller Co., and is especially designed for the improved screw of this company, the peculiar advantages of which for canal navigation, and the lightness aud strength of this boat, it is expected will settle the vexed problem of how to carry a paying freight at a fair rate of speed upon canals. It is thought that time now reqnired for through freights will be reduced to one-third or one-fourth of that now taken.—*Coal and Iron Record.*

Iron and Steel Rails.—As compared with iron the breaking tests which steel rails will stand are something wonderful; 1,000 pounds falling 10¾ ft. has long been applied as a breaking test for first-class iron rails, while steel rails stand a test of 2,000 ponnds falling 13½ feet.

The object sought in railway coustruction is a rail which will be hard enough to stand abrasion and wear, but strong enough to stand all the strains to which it is liable. The railroad engineer's idea of hardness is that quality which imparts durability without brittleness.

Freezing by Mechanical Action.—M. Foselli has annnounced to the French Academy of Science that he has snceeeded in producing an amount of cold just below the zero of the Fahrenheit scale, by simple mechanical action creating rapid evaporation. He employs a wheel formed of a spiral tube, both ends of which are open, set vertically and half immersed in the fluid to he cooled, so that the latter passes constantly through the whole length of the tube, half of which is constantly above the liquid, and, being wet, gives rise to active evaporation and consequent refrigeration within it.

The Largest Iron Casting ever attempted has been successfully achieved at the Elswick Ordnance Works, Newcastle-on-Tyne, under the direction of Sir William Armstrong and Captain Noble. It was a huge auvil block, weighing 125 tons, to he used with a twenty-ton double action forge hammer, for performing the necessary forging for the 35-ton Armstroug gun.

Iron ann Steel Dust.—A Boston mechanic recommenda the placing of electro magnets in shops where iron and steel dust prevails, to take up the particlea and prevent them from pervading the atmosphere and injuring the health. The experimeat would undoubtedly prove effectnal.

A machine haa been invented in Chicago for making type by a cold pressure process out of copper. It ia aaid that copper type made by this procesa lasta ten times as loug as cast type.

Four iron ships of the capacity of 2,000 tons each are now building at Buffalo, to run in the Buffalo and Chicago trade.

SCIENTIFIC PROGRESS.

New Triumphs of the Chemical Laboratory.

Reports from abroad chronicle another great step forward in the art of compounding certain chemical products, thns far only obtained by the intervention of vegetation, ont of their inorganic elements. The discoverer is Professor Schulze, who recently at the session of the chemical section of the German Association for the Advancement of Science, at Rostock, communicated his discovery of a method of making a series of hydro-carbon compounds, as benzole, nitro-benzole, or oil of myrbane, anihn, and anilin colors, from their inorganic element.

We have before ns a memorandum of the process employed, which is too lengthy for the columns of the Press.

The learned Professor also makes millitic acid, from any form of carbon, such as mineral coal or charcoal, also from graphite or plumbago. When this acid was first produced the Professor called it anthraconic acid; hut he soon found that it rosembled mellitio acid very closely, and finally that it was identical with the same. This being the case, the road was open to make successfully from inorganic snbstances, snch as carbon, permanganate of potash, soda, nitric acid, irou-filings and cbloride of lime, the series of mellitic acid, benzole, oil of myrbane, anilin and the anilin colors. As in a similar way the isatine, one of the coloring matters in the indigo, and the garancine, one of the coloring principles in the madder, have beeu made, the road is open to produce all these dye-stuffs, and probably several others, from the elemeuts, without having recourse to vegetable growth.

If, however, the growing of the plants producing these dye-stuffs, will, for the present, be not more econominal than compounding them out of their elements in the chemical laboratory, is a totally different question, which practical experience will decide. A great triumph, in the meantime, is the fact that tbe possihility to do this has been proved. Very likely, in the progress of these investigations, we may find the means to compound from their inorganic elements all the products now derived from the destructive metamorphosis of organic growth; and as oxalic acid, viuegar and alcohol have already been thns obtained, so we may some day produce grape sugar, dextrine, etc. However, it is very unlikely that we will be able to compound the smallest starch granule, as this possesses a highly-elaborate, organized structure, which is easily ascertained by the polarizing microscope. By the destruction of the starch granules, we obtain successively dextrine, gum, sugar, alcohol, vinegar, and ultimately carbonic acid and water.

Mechanical Effect of Magnetization.—The following is from a lecture by Prof. Tyndall: "The effect I wish to make manifest was discovered by Mr. Joule, and was subsequently examined by MM. De la Rive, Wertheim, Marian, Matteucci, and Wartmann. It is this:—At the moment when the current passes through the coil surrounding the electro-magnet, a clink is heard emanating from the body of the iron, aud at the moment the current ceases a clink is also heard. In fact, the acts of magnetization and demagnetization so stir the particles of the magnetized body that they, in their turn, can stir the air and send sonorous impulses to our auditory nerves. The sounds occur at the moment of magnetization, and at the moment when magnetization ceases; hence, if means be devised of making and breaking, in quick succession, the circuit through which the current flows, we shall obtain an equally quick succession of sounds. I do this by means of a contact breaker which belongs to a Ruhmkorff's induction coil. A thin bar of iron stretches from one of the bridges of this monochord to the other. This bar is placed in a glass tube, which is surrounded by copper wire. Tho contact breaker is placed in a distant room, so that you cannot hear its noise. The current is now active, and every individual in this large assembly hears something between a dry crackle and a musical sound issuing from the bar in consequence of its successive magnetization and demagnetization.

Obtaining Absolute Alcohol.—A German *savan* has recently improved on the well kuown method, employed by Mendelejeff, for obtaining absolute alcohol. Alcohol of ·792 is boiled with quicklime, the pieces of the latter projecting above the surface of tho liquid, for half an hour or more, with a condenser inverted so that the liquid may return by its own gravity to the flask. The condenser is then reversed, and the alcohol redistilled. If the alcohol contains more than 5 per cent. of water, the process must be repeated two or three times. The vessel should only be half filled with the pieces of lime, as the rapid formation of hydrate of lime may break it to pieces.

Electric Currants.—In the *Comptes Rendus*, for Jauuary 2d, M. P. Volpicelli has a memoir "On Electric Currents Obtained by the Bending of Metals." From this it appears that all metals, being bent or twisted, give rise to the development of an electric current, and that copper exhibits this phenomenon in the highest degree.

Recent Obsenvations of the Planet Venus. Although this "star of lova" is our nearest neighbor among the planetary bodies, wa know less about her than about several of tho family that are more distant. Her very brilliancy has interfered with the study of her face, blinding the observer "with excess of light," and little has been learned on the subject since the days of the indefatigable Schröter. At the heginning of the present year a committeo of the "Observing Astronomical Society," in Eugland, arranged for a series of systematic observations of the planet, and no less than thirty-seven gentlemen promised to aid in the work. They began their operations in March, and valuable results have already been attained. Markings upon the surface of the planet have been seen and deliueated by several of the observers, and there is a general similarity in the drawings made at the samo date by different persons. When the various sketches and observations have been carefully compared we may expect that our knowledge of the "geography" of Venus will be materially enlarged.

Sinking of Bodies in the Ocean.—Douhts about the sinking of bodies in tho ocean can only be entertained by those who imagine the water is more compressiblo than the bodies sinking in the same. Now the reverso is the case. Water at a depth of 8,000 feet is only increased one-hundredth part in its density or specific weight, while cork, wood or other porous bodies, will at a much less depth become so much compressed as to be unable to even reascend to the surface. They have become heavier than water, and, consequently, will float no longer, aud this is called water-logged. We have heard people who even went so far in their error as to assert that, at a sufficient depth, the density of the water is such as to prevent even stones from sinking further; the absurdity of this notion is evideut from the fact that in this case the whole ocean bottom would be floating.

Scientific Achievements.—What would the great father of British chemistry have said, had he stood in the lecture room of the Royal Institution, where his great discoveries were made, and seen the burning hydrogen extracted by our great countryman Graham, from a meteorite, the heat and light of another world; or could he look with Lockyer on the burning flames of hydrogen, which dart np from the sun to a hight of 50,000 miles, or could he read the flashing telegrams which so rapidly run around the world, that our notions of time are completely upset, and we actually receive intelligence to-day which was sent to-morrow? —*Ex.*

The Spectroscope ann Nebular Hypothesis Prof. Kirkwood says that the spectroscope has demonstrated the present existence of immense nebulous masses, such as that from which Laplace snpposes the solar system to have been derived. It has shown, moreover, a progressive change in their physical structure, in accordance with the views of the same astronomer. In short, the evidence afforded by spectrum analysis in favor of the nebular hypothesis is cumulative and of itself sufficient to give this celebrated theory a high degree of probability.

Power of the Sun's Rays.—Mr. Siemens, the well known English telegraphist, has invented a photometer which has proved that light penetrates to a depth of one hundred fathoms below the surface of the sea. Hitherto it has been supposed that thirty fathoms was the farthest depth to which the sun's rays could reach, but an apparatus, of which the maiu feature is chemically prepared paper, has proved that the sun is more than three times as powerful as was supposed.

Vapors from Smelting Works ann Vegetation.—The apparently injurious effect on vegetation of the vapors from the smelting works at Freiberg, Saxony, has given rise to careful investigatious and elaborate experiments with certain plants on the part of the authorities. It has been found that neither the soot or the arsenious acid of the vapors injures the vegetation, but the sulpburous acid, even in very small amounts, has a deadly effect. Moreover, the feed raised in the vicinity causes peculiar diseases of cattle.

Buddhu's Rays.—A resident of Colombo, in the island of Ceylon, writes to *Nature*, describing a curious meteorological phenomenon which occurs there, and which the inhabitants call "Buddhu's Rays." It consists of radiated bands in the sky, alteruately of rose color and blue, proceeding from a point close to the horizon, and is generally noticed in the west at sunset, although it occasionally appears in the east. It commonly extends from thirty to forty degrees.

Professor Shepard, of Amherst College, Mass., has one of the largest collectiona of meteorites in the world. It embraces 146 different meteoric stones and 94 meteoric irons. The heaviest specimen of the irons ia one from Aerotopaa, weighing 438 pounds, and the largest of the stones is that from New Concord, weighing 52 pounds.

A microscope lena was recently made in London, at the cost of $1,250, from a diamond, its magnifying power being an increase over that of glass as eight to three.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior,in proximity to the mines mentioned

California.

ALPINE COUNTY.

RICHER AND BETTER.—Monitor *Miner*, March 30: The Tarshish miners struck this week the richest and finest body of ore ever opened in any part of this lode.

AMADOR COUNTY.

KENNEDY.—Jackson *Ledger*, April 6: On Monday and Tuesday the Kennedy made a clean up of 365 ozs., after a run of 19 days. A new ledge about 2½ ft. thick has appeared on the 400-ft. level, which surpasses in richness any rock yet discovered. The Kennedy now has 2 distinct ledges, either of which are charged heavily with free gold.

CALAVERAS COUNTY.

PETTICOAT.—San Andreas *Citizen*, April 6: This claim is down 400 ft. and the rock becomes richer as they progress.

CAPITOL.—This claim, about one mile from town, has struck some very rich rock, showing free gold.

HUDSON.—Last week some ore tested assayed $15.06 to the ton. The Co. are still sinking on their shaft and the ore seems to grow richer as they progress.

MILL'S GRAVEL LEAD.—This claim is paying remarkably well. A shaft was originally sunk on the lead about 40 or 45 ft. deep. Thence the Co. have followed up the lead hy drifting and are in over 500 ft. The gold seems to grow coarser as the drift progresses. Last Saturday a 2-week's run was cleaned up, netting over 40 ozs. The Co. are working 10 men day and night.

WHISKY HILL.—Cor. same: The mines are heing worked vigorously. Three hydraulics are running; Bunker Hill and Whiskey Hill Tunnel Cos. are using the large patent nozzles; Collins & Co. and Meyers & Co. are running a hydraulic, and other small claims are by no means idle.

WORK RESUMED.—Calaveras *Chronicle*, April 6: Operations have been resumed upon the Whisky Slide mine. The battery is once more in motion, crushing a fair quality of rock, and work upon the lead is also heing pushed ahead.

EL DORADO COUNTY.

GARDEN VALLEY.—Cor. Placerville *Republican*, April 4: The Isahel is worked by Swain & Co., who have a 10-stamp steam mill erected. There are some good claims that are heing worked by hydraulics, and among them Capt. Blaisdell's and Mr. Stowe's.

NEVADA COUNTY.

RICH ROCK.—Grass Valley *Republican*, April 5: Ryan and Donahue had 12 tons of quartz from their ledge in Woodpecker's ravine crushed this week at the Gold Hill mill which yielded $62 a ton.

HEAVY BRICK.—A gold brick weighing 529 oz. made its appearance at Delano's banking house yesterday, from the Empire mine, valued at $8,900.

RICH DISCOVERY.—A party of prospectors a few days ago discovered a rich pocket of quartz on Woods' ravine, and took out about $700 worth of specimens.

ERIE MINE.—The mine on Deadman's Flat was located in May last. The first crushing of two loads of rock yielded $222. The second crushing of 9 loads in July yielded $145 a load. The third crushing iu Oct. of 15 loads yielded nearly $500 a load. Last Friday 20 loads were crushed, yielding $60 per load. The owners have sunk only about 50 ft. on the ledge, which averages only ahout 6 inches in thickness.

IMPETUS TO MINING.—Good paying ore has been struck in the Gold Tunnel mine near Nevada City, at a depth of about 400 ft. from the surface. In codsequence of the discovery Gashwiler and others of S. F. have purchashed the California mine, which is a continuation of the Gold Tunnel, as also the Illinois.

LOCATIONS.—Nevada *Gazette*, April 6: F. Hoffman & Co. havelocated 1,000 inches of water of Little Greenhorn creek to be taken out of the creek one mile helow the Greenhorn quartz mill, and to he conveyed by ditch to Boyd's ravino, for mining purposes.

The same parties havo located 1,000 ft. of ground fronting on Boyd's ravine, and also the ravine for fluming and mining purposes.

Gamble & Co. have located 800 ft. on the Gracie ledge southwest of the Gracie Co's location, in Nevada township.

R. C. Walrath and others yesterday located 800 ft. as a southern extension of the Grarie ledge, commencing at the southerly houndry of Graire Co.'s claim and running southeasterly 800 ft.

HANDSOME RESULT—Grass Valley *Union*, April 4: A lot of hlack sand, containing gold covered with rust and slime, 220 pounds, from the Webster gravel claim, from which the gold could not he saved hy ordinary sluice washing, was yesterday cleaned up at the Coe mill, from Justin Michel's amalgamating pan, and produced 17 ounces of hard amalgam, which retorted 11 ounces of excellent gold, worth over $18 per ounce, or a net result of something over $200.

MINING MATTERS.—The shaft of the Daisy Hill mine is down to a point where drifts are to he run.

The repairs having heen made to the pumping machiuery of the North Star, tho pumps are again at work and rapidly freeing the mine of water.

CHUNK OF GOLD.—Nevada *Transcript*, April 7. We saw a heautiful lot of gold, yesterday, valued at $2,560, the result of 10 days' work in a placer claim, near this city.

PLACER COUNTY.

GOOD YIELD.—Auburn *Herald*, April 6: Jones of the Bellevue has finished crushing the rock taken from that mine, at the St. Patrick mill. The amount of ore reduced was 429 tons, and the yield was some $18,000, an average of over $40 per ton.

SAN DIEGO COUNTY.

BULLION.—San Diego *Union*, Maroh 28: Bullion valued at $10,138 was shipped to S. F. last Sunday, all from Sau Diego mines.

CLEAN UP.—Mr. Farley of the Stonewall mine, arrived on Wednesday. He brought with him a gold brick, valued at $1,800, result of an 8-day run at the mill.

ITEMS.—San Diego *Bulletin*, March 30: C. Pauley returned from the mines yesterday, bringing a gold hrick worth $800, the product of 21 tons of rock from the Helvetia, crushed at Pierce's mill, the clean up of last Tuesday.

TRINITY COUNTY.

DOUGLAS CITY.—Cor. Weaverville *Journal*, March 30: Roderic & Rabbit are working a point on Mule Gulch which pays them $10 per day to the hand regularly. Jas. A. Johnson has his new derrick upon Stratton's old claim and it works splendidly. They hoist boulders out that weigh several tons with a 12 foot wheel.—Mr. Silcox makes $300 per week regularly. Manuel Silva & Co. have made a partial clean-up of 102 ounces in a five weeks' run. Gahriel & Co. have ground enough sluiced to keep them cleaning up all Summer. Frank Silva & Co. have done very well. Hennessey & O'Keefe are rushing things on Spring gulch and are making money fast, but Morris & Smith heat them all. They have no rocks to handle, nothing hut red loam. They pipe away the loam and there lays the gold. They pick up pieces that weigh from $2 to $5, 2 ft from the hed-rock. Last week they took out 40 ounces with only 2 men at work.

Nevada.

ELKO COUNTY.

RAILROAD DIST. — Elko *Independent*, April 6: The erection of 2 smelters will probably be commenced within 10 days by the Hussey Co.

THE Lee mine, at a depth of 120 ft., has a large body of ore assaying on an average $390 per ton.

THE Elko tunnel, at a distance of 200 ft., has struck a large body of ore 7 ft. between the walls.

A LEDGE 15 ft. wide of rich coppor ore has heen struck in the State of Maine Tunnel.

THE Hunter mine has a fine body of ore at a depth of 90 ft.

THE Hussey Co. has commenced to work on a tunnel which will strike the Last Chance mine at a depth of 300 ft.

ELY DISTRICT.

BULLION.—Ely *Record*, March 31: W. F. & Co. shipped to-day, hullion valued at $53,695 87.

BRISTOL DIST.—In the hay State the ledge is fine-looking, and from present developments it is a valuable mine. The ore is 4 ft in thickness, and looks well. On the dump there are about 250 tons that will average over $100 per ton. At the lowest point of the incline, 83 ft from the surface, the ore looks well, and is as extensive as in any other part of the mine. The ore is oxide of lead, with a small percentage of carhonate, all carrying silver aud a small percentage of gold.

In the Mayflower but little work has been done, almost 40 tons of good ore are on the dump.

The Cave mine is on the northside of Copper Mt. This mine is worked by a tunnel which starts into the mountains ahout 100 ft ahove the hed of the cañon. The tunnel follows the hanging wall of the ledge 122 ft, but the ore being so very thick, it was found necessary to raise up to another level, 17 ft ahove the main tunnel, and from this point the tunnel continues 85 ft further, the full size of the tunnel heing in ore. The ore is oxide and carbonate. The ledge will average over 8 ft in thickness from the mouth of the tunnel to the point, 225 ft back in the mountain. The dump contains over 1,250 tons of ore that will average an assay of $80 per ton. The National is the south extension of the Cave and is a very fine claim. It is opened by a tunnel which follows the ledge 80 ft, and from this point an incline is sunk 40 ft deep, every foot of the workings showing a fine ledge.

EUREKA DISTRICT.

FINE ORE.—Eureka *Sentinel*, April 2: The Eureka Con. Co. shipped to S. F., a few days ago, 16,000 lbs. of the fine ore recently developed in the lower workings of the mine.

DIAMOND DIST.—The owners of the Champion are working their property day and night and are opening a fine body of mineral.

SILVER LICK.—The main shaft is down 70 ft. and the ledge is one of the largest and best defined in the dist. At the first station, 35 ft. from the surface, drifts are being run each way on the ledge. In one of these drifts an immense body of high grade ore has heon developed withiu the last few days.

HOT CREEK.—Cor. same: Our mines are not in as forward a condition as they might he, from the fact that the owners have not the means to reduce their ores into bullion.

At Moore's dist., 15 miles northeasterly from Hot Creek, about 7 tons per month of assorted ores are shipped to the Manhattan mill. This ore works ahout $400 per ton.

The New Philadelphia mine, in Rattlesnake Cañon, 6 miles northwesterly from Hot Creek, is about to be operated on.

The "2 G" (Twogee) mine is, perhaps, the leading miue of Tyho dist. The props. have opened the mine, in several new places, from the hottom to the top of the hill, a perpendicular of about 300 ft, and in so doing have stripped large bodies of galena, rich in silver. They have sunk also a shaft, 70 ft., at the foot of the hill, hringing up good ore from a well defined ledge, and the work still goes on upon the shaft.

In Empire dist., which joins Tybo dist. on the north, John Centraz has struck a mass of surface ore of a peculiarly deceptive character. This mass is a very large out-crop of lime spar and quartz of a speckled or freckled appearance, hut it assays variously from $20 up to $12,600 in silver per ton.

HUMBOLDT.

RICH MINE.—Unionville *Silver State*, April 6: One of the richest silver mines in this county has heen opened and is heing steadily worked by C. Gregg. The mine is 20 miles from Golconda Station in Gold Run Dist., and at present a shaft 60 ft in depth has been sunk, from which ore has heen taken which worked $421 to the ton.

NATCHEZ.—This mine, in Sierra Dist., a short distance south of the Gem mine, is turning out ore which yields ahout $400 to the ton.

PATTERSON.—The mine helonging to this Co., commonly called the "Lead mine," is about 4 miles from Golconda Station, on the C. P. R. R. A shaft is down ahout 30 ft. with good prospects for a valuable mine

BONDED.—The Eagle in Indian Dist. was honded on last Thursday for 90 days and the price is $25,000.

COPPER MINES.—Capt. Winn, at Summit Springs, has recently discovered some valuahle copper mines in that vicinity.

CENTRAL DIST.—A lot of ore recently shipped from the mine of Ruse & Co. is said to have yielded very handsomely. Work will be prosecuted with vigor on that side of the river this summer.

REESE RIVER.

BULLION SHIPMENT FOR MARCH.—Reese River *Reville*, April 2: The following is a summary of the bullion shipped through the office of W. F. & Co. in this city during March. 134 bars, 11,826 lbs., of the value of $128,646.65. Of these, 11 bars were from the Murphy Mill, valued at $10,515.20; 38 from the Belmont mill, valued at $18,791.69; 11 from the Ellsworth mill, valued at $10,640.36 and 74 bars from the Manhattan mill, valued at $88,709.40.

WASHOE.

BULLION SHIPMENT FOR THE PAST QUARTER.—The following is the hullion shipment of W. F. & Co., from their office in this city, for the past 3 months: Shipped during Jan. 468 hars, 34,939 lbs., valued at $914,189.22; for Feb. 476 hars, 37,061 lbs., valued at $954,111.38; and for March 509 bars, 39,024 lbs., valued at $1,066,247.70. This makes a total for the quarter of 1,453 bars, weighing 111,024 lbs., worth $2,934,548.30.

SUTRO TUNNEL.—The Tunnel was in March 30th 2,811 ft. Shaft No. 1 was down 132 ft.; No. 2, 307 ft.; No. 3, 156 ft; No. 4, 150 ft.

It is rumored that a new and promising deposit of ore has heen struck in the Savage, near the winze which connects with the drift on the 1,400 ft. level.

WHITE PINE.

NORTH AURORA.—White Pine *News*, March 30: TREASURE HILL MINES.—The force of miners in tho Ridsdale chamher has been increased since our last visit. The ore in sight averages over $100 per ton, and requires but little assorting. The hody has increased since last report, and from present appearance promises to prove as extensive as the famous Lady's chamher. Hoisting ore, day and night, hy whim.

SECOND SOUTH EX. OF HIDDEN TREASURE.—Extracting ore from the bottom and South side of the Anchor incline. The ore extracted will mill $30 to $40 per ton. The drift running north to connect with the drift from the north shaft is pushed ahead with 2 shifts, and shows a well defined spar wall for the whole distance. The indications are favorable for developing a good mine.

SAN JUAN DEL RIO.—The usual force is employed, with improved prospects, completing the prospecting shaft to the depth of 125 ft. The shaft is down 48 ft. and shows richer ore iu the hottom than any yet found since the mine started up. Capt. Boyle will, after a depth of 125 ft. is attained, run levels from the main shaft, and commence stoping out ore for shipment to mill.

EAST SHEBOYGAN.—Breasting out in the west cross-cut. Coutractors have pushed the drift from the Exchange incline ahead 6 ft. the past week. The chances for coming on the ore-hody soon are favorahle.

BEECHER CON.—Four men are employed running the east drift from ore chamher.

SILVER WAVE.—Rich ore is extracted from the Boswell shaft.

EBERHARDT.—Breasting ont in the south stope of the Keystone shaft, in a fair grade of ore.

WARD BEECHER.—Working in the east drift to connect with the Lady's chamber.

SCHELL CREEK.—Cor. Elko *Independent*, April 6: The Wide West, on Ruby Hill, has a shaft on it 30. ft., showing good ore all the way. The ledge is 10 ft. between the walls, and work has heen resumed on it, and will he prosecuted vigorously. The ore is of a high grade.

THE Ajax, helonging to the same cluster of rich mines discovered last fall, although hut partially prospected, is looked npon as one of the most promising mines in the Dist. This ledge has a shaft sunk on it 10 ft. deep, showing at that depth rich ore, 8 ft. between casings.

THE Silver Wreath is heing rapidly developed, showing good ore the whole depth of the shaft, which is down 20 ft., with a 7 ft. ledge hetween the walls.

THE Lookout is in the same neighborhood, showing a ledge of rich carbonate ore, 5 ft. wide. A shaft 30 ft. deep has heen sunk on the mine, and the owners are busily at work going down.

NEAR Schellbourne the most promising mines are as follows: McHahn, which has a shaft 15 ft. deep and is 10 ft. hetween the walls; Woodhurn, with incline 12 ft., shows a rich hody of ore, $240 per ton, 6 ft. wide; Ontario, with incline 30 ft., shows a 3½ ft. ledge, that assays from $1,500 to $2,100. This mine is in the vicinity of the Ferguson spring, which affords 30 inches of water the year around.

THE St. Paul is another promising ledge, north of the overland road. Work already done on it demonstrates it to he a trne fissure vein of high grade ore.

Arizona.

WALLAPAI.—Cor. Prescott *Miner*, Mar. 23: Meechem & Harey's mill is working on splendid ore from several ledges. I saw 26½ lbs. of hullion taken from 3 tons of ore of the Rilay ledge.

THE furnace of the Chloride City will be ready for work in about 2 weeks, and another one for Cerbat, is on the road between Los Angeles and the Colorado river. It is expected to he in operation in about 8 weeks.

THE ledges around here are very promising. The Fairfield, Keystone, and other lodes are heing worked night and day, and are gradually becoming richer as the work progresses.

SEVERAL capitalists have arrived from San Francisco and the East, with a view of erecting mills, etc., here.

HUALAPAI.—(Some paper Mar. 30:) J. Leopold exhibited to us yesterday specimens of ore from the mines of Chloride, 5 miles from Mineral Park. One specimen was taken from the shaft of the Silver Hill Co., at 120 ft. from the surface, and another was obtained from another shaft on the ground of the same Co. at 80 ft. from the surface, both of which are exceedingly rich in silver. The lowest average assay value of this ore, is $213.56. The ledge is 7½ ft. in width and increases in richness with depth. They are engaged in driving a tunnel to tap the vein, having commenced operations simultaneously on both sides of the hill. Specimens of ore obtained from the Pink-eye, 10 ft. from the surface, assay as high as $1,500 per ton. Work is being vigorously pushed, and they are down 30 ft. Sinking on the Diana ledge has reached 40 ft. The assays of ore are various, but in every instance exceedingly rich. All the ledges that have been prospected are looking well, and every effort is being made to develop them. Mr. Cover's smelting works are going up rapidly. There is a sufficient quantity of ore on the dumps to keep these works employed for at least 2 years. The average width of the ledges throughout the dist. is about 20 inches.

Colorado.

ITEMS.—Colorado *Miner*, Mar. 28: H. Utter shipped on account of owners, during March, 170,000 lbs. of smelting ore to Black Hawk. There were crushed, sampled and sacked, at G. W. Hall's mill, during March, 120,957 lbs. of smelting ore. Palmer & Nichols who have shut down for repairs, have started up again. Baily & Nott shipped during March, on account of owners, 90½ tons of smelting ore. This firm have on hand, ready for shipment, 250 tons. The value of the ore shipped and on hand will reach $140,000.

SNOW & Co. seem to be cracking away bravely in the Butler lode, Gunnell Hill. The main shaft is 35 ft. in depth, carrying a rich vein of ore. The works have been put into first-class order.

J. W. CLAYTON, of Nevada, has placed upon our table a retort weighing 100 ozs., the result obtained from his stamp-mill from 9 cords of ore from the claim of Roberts & Co., on the Kansas lode.

THE COOK property, on the Gunuell lode, that has lain idle for so long was leased a short time since to Richards, Grow & Co. During the present week 5 cords were treated at Kimber's mill, Black Hawk; yield, 9 ozs. per cord.

ROBERTS & Co., on the Kansas are working the Ophir G. M. Co.'s claim. Throughout the mine, in levels, stopes and shafts, the pay ore averages 30 inches in width, 1-class ore selling for $85 per ton, and the 2-class paying 11 and 12 ozs. per cord under stamps.

BOULDER Co.—Cor. same: Three Cos. are working on the Celestial lode, in Ward. They are taking out a good quality of ore, and have about 10 cords on the dump, ready for milling.

JOE LONG and Chas. Holverson are at work on the Columbia, and have about 5 cords on the dump. L. & H. will soon start up their 10-stamp mill on Left Hand.

ALBERT OSBORNE will commence work in the gulch mines on Four-mile creek, as soon as the water starts running.

BOULDER.—The North Boulder ditch running from Graham's old ranch to the White Rock Mill, is to be enlarged to 6 ft on the bottom, and will carry about 3 ft of water.

At Switchville, Williams & Mitchell are sinking on their lode, and are down 20 ft. At that depth, the ore is running from $350 to $800 per ton. Amasa Bixby and Tom Davis, think they have discovered the extension of Williams & Mitchell's lode. The ore looks well at a depth of 10 ft.

Idaho.

WARREN'S CAMP.—Cor. Lewiston *Signal*, March 16: Both the Rescue mine and mill are in full operation. On the 10th they expected to make a clean-up of a 2 week's run. The prospects look as well as ever, if not better. A second chimney of good ore had been reached in drifting east about 200 ft from the terminus of the tunnel.

THE MINES.—Walla Walla *Union*, March 23: A busy and prosperous season is anticipated by all. In Warrens' diggings everything is being put in readiness. In the Oro Fino dist in the vicinity of Pierce city a new ditch was completed last season and there will be an abundant supply of water. At Florence, one Co. commenced work about 2 weeks ago, and others were preparing to follow. In the Elk City camp the Chinamen have commenced working their claims, and expect a long season as the snow is about 10 ft deep on the summit. On Newsome creek the miners are getting to work, all the hydraulics being in full operation.

Montana.

DIAMOND CITY.—Helena *Gazette*, March 25: The mining interests in old Confederate gulch present a lively appearance, and several Co.'s have been drifting and washing up dirt all winter with very rich results. D. P. Rankin is running his claim night and day, and employs some 40 men. The har diggings will be started up immediately. Michael Welsh, of El Dorado Bar, is making preparations to commence work on an extensive scale next week.

THE REDUCTION WORKS.—Helena *Herald*, March 28: This morning the largest silver button ever cast in this Territory was turned out at the Helena Reduction Works. Its weight is 308 lbs, and its value is upwards of $6,000.

WEST SIDE.—Cor. same: Lyon's mill is running day and night, turning out bullion of superior fineness.

The St. Louis mill has just started up, crushing ore from the Eastern Comanche.

Work on the Eastern and Western Comanche is being prosecuted. A shaft is being extended on the Hope, and the newly discovered Little Emma lode is likely to prove far from small, as day by day it shows up better. The trout remains the leading richest fish, both in the camp and Territory.

Another mill will be erected here the coming season by a Wheeling Co.

BLACKFOOT.—Deer Lodge *Independent*, March 30: Mining has been commenced in a few claims in Ophir gulch and on the Bar.

PHILIPSBURG.—Col. Lyon is crushing Speckled Trout ore with good results. Holland & Co., are taking out ore from the Emma, which will average about $80 to the ton, with an 8 ft. lode at the depth of 68 ft. H. Brown has hands at work on East Comanche, Cordova, and Dashaway lodes, taking out ore.

NEW MINES.—Winchell & Co., have commenced work on the new mines discovered last fall in the bar or hill east of Flint Valley.

The Cameron Mill at Cable will start up next week. It is expected that 300 tons of ore will be crushed before the mill is shut down. The ore being taken out is said to be very rich.

Oregon.

Portland *Oregonian*, March 2d: Mining prospects are first-rate. Seventeen companies of Chinaman are at work on "Maiden Gulch," Eagle District, Union county, and miners at work in Rye Valley.

BOHEMIAN MINES.—W. S. Burnham, Superintendent of Knott & Ladd's mill, in the Bohemian mines, informs us that on Monday next he expects to resume operations.

PIG OF COPPER.—At Ladd & Tilton's bank can be seen a pig of copper weighing seventy pounds, the result of eight hundred pounds of ore, taken from a ledge discovered some years since, a few miles from Baker City.

Utah.

BULLION.—Salt Lake *Tribune*, April 2: 2 bars were shipped to-day to N. Y. from the Pioneer mill, East Cañon, worth $1,-909 87.

A new body of ore has been struck in the Emma, 10 ft in width, chloride ore, the average assay of which goes $1,900 per ton.

From Butterfield Cañon, near Bingham, a car load of ore came in which is worth $10,000. A little over 10 tons assays over $900 per ton.

In the Sparrowhawk, recently sold to an English Co., they have a body of ore 12 ft wide, which assays from $125 to $129 per ton.

DESERET DIST.—The dist. is 125 miles SW of S L City on the edge of the desert.

The claims already located, of most importance, are the Sheet Anchor, Dudley, Shade Tree, Spring Branch, Douglas, and Dauntless, and of these the Sheet Anchor and Dudley, both on the same ledge, the first named running westerly 800 ft, and the second easterly the same distance from the discovery monument, constitute the great ledge of the dist. At the discovery monument the locators have unitedly run a tunnel about 50 ft into the hill, widening it out at the inner end from top to bottom to 17 or 18 ft, finding the true hanging and foot walls that distance apart, and pitching at an angle of 40 or 50 deg. into the hill. Both the tunnel and exterior indications show that this is a monster ledge. A number of excavations made upon it at different points around the hill, show the same ledge matter of unknown width, and large lumps of galena and carbonate ores, testify to the character and value of the treasures which lie beneath.

The Shade Tree has a prospect hole of 14 ft in depth, and shows a ledge of 5 to 7 ft with good walls pitching perpendicularly, and with a "strike" east and westerly.

The Dauntless has a shaft 25 ft deep, the ledge widening as it goes down, and has several tons of handsome ore on the dump.

The Hawkeye tunnel on Lion Hill is in 300 ft. They have already found some horn silver and an abundance of low grade ore in the tunnel.

OPHIR ITEMS.—The Aiken Furnace is said to be a complete success. Aiken it is said has the contract for erecting another furnace at Lewiston, Camp Floyd Dist.

The Co.'s having interests on Lion Hill are commencing operations again on a large scale.

The English Co. is beginning to operate extensively, and Col. Fawcett is expecting to complete his mill in the course of a few weeks.

The Brevoort mill is likewise to start next week. The arastras are all busy, turning out considerable bullion.

STOCKTON.—Cor. same: Jacobs intends erecting a three stack furnace at this point this spring, and several others are spoken of as about to construct small furnaces. A mill is also in contemplation.

In the Putuam mine the main inclined shaft is 185 feet deep. At the depth of 80 feet a side shaft is down 85 feet, with a level of 14 feet. Many hundred sacks of ore are stored near the dump.

NORTH TINTIC.—Cor. same: The district is in the mountains bordering the east side of the southern end of Skull Valley. The following mines have been located: Black Crook, Blue Jacket, Blue Eagle, Belle of the West, Cosmos and several others.

The Black Crook is down 15 feet, a cut lays the vein open to a width of ten feet, and yet the north wall has not been reached. This is a large vein, being traced on the surface for several thousand feet. The assays range from $26.50 to $713.17.

Several of the mines are being worked, and in the course of a week there will be over a dozen first-class mines in full operation.

SILVER CITY—Meader & Co. have a force of twenty hands at work on the Mammoth, a copper bearing mine. The same company is working the Swansea and Sunbeam.

S. L. CITY.—From a general letter we condense as follows: At Camp Floyd a 20-stamp mill is being erected by the Sparrow Hawk Co., and within a very few days a sale of the Silver Circle was effected for $30,000, on which the remaining $14,-000 was paid in this city to-day. A tramway or double track is to be constructed from the Sparrow Hawk mine to their mill, a distance of 4,000 feet. Many late strikes have been made in that camp. Pardee & Murphy have found very rich ore in their shaft. Barry & Butler have very fine horn silver in their shafts, all of which are near Colorado gulch. The depth of these shafts varies from 20 to 35 feet. There is much talk of a mill being built at that point early in the spring.

S. F. Stock Exchange Board.

SAN FRANCISCO, April 11, 1872.

The sales at the Board for the week ending Friday the 5th, aggregate, $4,308,000. The amount of dividends of three mining companies declared on the 6th, amounted to $718,000; of this the Belcher paid $208,000, the Crown Point, $300,000, and the Raymond & Ely, $210,000; being the largest dividends ever paid by the mines mentioned. During the past four months, the Belcher has paid in dividends, $624,000, and the Crown Point, $780,000; making a total from the two mines of $1,404,000. During the week ending on the 6th, 820 tons of ore were extracted from the Chollar-Potosi mine, assaying $34.62 per ton. On the 9th inst., the third remittance for the month was sent down from the Raymond & Ely, amounting to $93,700; and on the 5th, $9,100 was sent from the Bowery mine. The amount sent from the Murphy mine, since the mill started up last month, is $10,600.

There was no session of the Board on Wednesday morning, it having adjourned in respect to the memory of Wm. F. King, a member of the Board, who died the day before.

During the past week, 300,000 tons of ore were taken from the Crown Point, valued at $198,000. The meeting called for the 15th inst., by the Trustees of this mine, is for the purpose of taking into consideration a proposition to increase the number of shares, so as to make it available for small investors and more popular in the Board. The capital is now $3,000,000 in 12,000 shares. It is proposed to make the capital $10,000,000 in 100,000 shares.

The Stock market has been more active of late than ever before. A number of new stocks have been placed on the market and all of them sell readily. Prices for most all kinds are unusually high, and it is generally thought that a fall must shortly come. The excitement is great, and anything in the shape of mining stock sells quickly.

Some of the Nevada mines have increased wonderfully in value during the past few weeks—values that a year ago no one would have believed possible. The following table exhibits the current market values of some of the leading mines, as based on prices at which they were sold in the Board yesterday:

	Feet in Mine.	Price per foot.	Value of Mine.
Belcher	1,040	$ 8,250	$ 8,580,000
Chollar-Potosi	2,800	1,060	2,968,000
Crown Point	600	20,000	12,000,000
Gould & Curry	1,200	1,430	1,716,000
Hale & Norcross	400	10,000	4,000,000

Leather Market Report.

[Corrected weekly by Bolliver & Bro., No. 109 Post st.]

SAN FRANCISCO, Thursday, April 11, 1872.

SOLE LEATHER.—The demand is still equal to the supply, and prices still continue firm.

City Tanned Leather, ₱ lb	26@29
Santa Cruz Leather, ₱ lb	26@29
Country Leather, ₱ lb	25@28
Stockton Leather, ₱ lb	26@29

French skins are firmer with an advance in some grades. Heavy California skins are firm, with an upward tendency.

MINING SALES.—The Woodburn mine, 12 miles north of Shellburn, Schell Creek District, Nev., was recently sold to a party of military men residing in Washington, D. C., for $20,000.

The "Pride of the Mountain" mine, near Winnemucca, has been sold to a company in this city. The ore from the mine is good, but difficult to treat.

The El Dorado South has been purchased by H. Rutherford & Co. The mine is at Belmont, Nevada.

The California and Illinois claim, at Nevada City, a continuation of the old gold tunnel claim, has been sold to J. W. Gashwiler and others.

The sum of $30,000 has been paid on the purchase of the Davenport mine in Utah.

Trouble Among the Miners in Idaho.

For some time past there has beeu a growing dissatisfaction among the miners employed in the Mahogany Mine, concerning the foreman, Mr. John Jewell, who, it ia alleged, is lavish of ahuse to the miners under his charge, endeavoring to cut down their wages, etc. The disaffection gradually spread among the handa in the other mines, until last Wednesday morning it culminated in the following notice, which was found posted up in the varions boarding houses and other public places on the mountain:

Take Notice.

"War Eagle Mountain miners and laborers: Be it well understood hetween all partiea interested in earning their living iu these mines, we are oppreased with alavery and bad rules since Mr. Jewell, foreman of the Mahogany mine, has entered this camp, and we will all unite ourselves together for the sake of our heloved country and camp to send this nuisance hy atage to Winnemucca, and never to return no more to this camp under penalty of death—and all to meet armed on the divide hetween Fairview and Orevena, on Wedneaday evening, March 20th, at seven o'clock P. M. To all nations, kindred and tongnes."

The above is about a *verbatim* copy of the notice. A meeting, attended by some three hundred miners was accordingly held, and Mr. Jewell was notified to leave the Mahogany Mine by seven o'clock the next morning, or suffer the consequences. Sheriff Stevens, hearing of the affair, went up to the scene of the trouble. Between nine and ten o'clock at night news came to town that the moh had insulted and abused the Sheriff, and threatened to hang the obnoxious foreman. hurn the works. etc. Superintendent Minear being in San Franoiaco, acting Snperintendent George H. Coe, Esq., deeming it hia duty to protect Mr. Jewell and look after the interests of his company, immediately procured teams and sent up some forty men armed with shot guns, Henry and Spencer rifles. He also aent up two mountain howitzers—one a twelve and the other a six pounder—with solid shot and grape and cannister. It was expected that a battle would ensue the next morning (Thursday), hetween the miners and General Coe's force occupying Fort Mahogany. But, whatever their intentions might have been, the miners from the Mahogany, Minnesota, Golden Chariot, Ida Elmore, Oro Fino and other mines had a meeting, about eight o'clock in the morning, and instead of making any hostile demonstrations, resolved that they would not go to work in any of the mines as long as Jewell remained at the Mahogany. Thus matters atood till yesterday, when Mr. Jewell came to town, leaving Russ Carter ia temporary charge of the mine. General Coe has withdrawn his artillery and other forcea from the mine, and from present appearancea work will be going on as usual in all of them to-morrow or next day. When all the miners in camp, with scarcely a dissenting voice, express a univeraal dislike to a man, there must be something wrong, and we should not care to stand in Mr. Jewell's ahoes, if he persists in remaining.

On Thursday afternoon a Miners' Union League was formed at Fairview, and at last aocounts yesterday 186 persons had joined the organization. To-day the numher will probahly be angmented to 250. So long as such a comhination of meu doea not meddle with matters which do not concern them, and with which they have no legitimate right to interfere, then it is proper enongh; otherwise, they will go contrary to their own interests, as well as injure the camp.—*Owyhee Avalanche, Mar. 23d.*

THE LONGEAT BRIDGE IN THE WORLD.—The Tensas and Mohile bridge, or hridges, on the Mobile and Montgomery railroad, extends from Tensaa atation on the Mohile and Montgomery road, to the city of Mobile, a distance of fifteen miles, crossing both Mohile and Tensas rivers and including ten draws, one for each of the navigable channels into which the rivers are divided. The hridge itself is constructed of wood, but its piers or supports are iron oylindera, whioh rest on a solid surface of wooden piles driven down evenly with the bottom of the stream and the mud of the intervening morasses. It has heen three years in course of construction, at a cost of ahout $1,500,000, and now that it has been succesafully completed, it is perhaps the longest structure on the globe.

THE Custom House at Portland has cost $114,324.79.

The Manufactures of San Francisco.

We condense a review of the last year'a work of the numeroua manufacturiug establishments of this city, from the *Bulletin*, which will show more conclusively than anything else could the growth of San Francisco in a business point of view. The year 1871 has heen a favorable one for maunfactures. The majority of industrial occupations show a material increase in the value of productiou, the capital invested, the numhers of employees, and the number of factories. In some few cases, however, this is not so, and to the iron interests in particular the first 9 mouths of 1871 were trying indeed, but these, aa well as othera ao circumstanced, have for the remainder of 1871 taken a decided step in advance, and promise to hold it, if not improve on it, during the preaent year.

Increase of Business.

Unusual developments have taken place in several branches of maufacture, among which the cigar iuterest takes the lead, having, during 1871, doubled both in production aud value. Among the others which have extended busiuea are the manufactures of boots and shoes, leather, furniture, upholstery, saddlery, jewelry aud silverware, champagne, cigar boxes, biscuit and ship bread, and iu that of caska, barrels and kegs. The old establishments are continually adding to the capacity of their works, to the nnmber of men employed, aud increasing their capital. This city will soon become an important manufacturing center of carriage and railroad car work, and will supply China, Japan aud the eastern coast of Sontb America with that article. The woolen mills are constantly iucreasing their capacity and turning out superior products. The rolling mills have been busily occupied all the year, and we may expect this line of industry to become one of the foremost. Our printers and lithographers are now doing as good work as any onthe Continent, and as a consequence very little of this class of work is sent East. The smelting works and refineries have had a most prosperous career.

New Industries.

Among the new industries started within the past year are the manufacture of gas and water pipe, gas fittings, window shades, kid gloves, Eureka hair, smoking tobacco, paints and varnish, block pavement aud fuse, file-forging and wire-making, all of them importaut.

Among the industries that have received a new impetua are the manufactures of hedsprings, toy and baby carriages, silk thread, furs, vinegar, artifical stone and carriage-spriugs.

Exports.

The material for all of our most important manufactures snch as those of iron, hrass, cigars, carriages, furniture, clothing, upholstery, boats, etc, is ohtainahle from ahroad. This is of conrse the reverse of favorahle, and were it not that we were so distant from all competing centers, the greater part of our manufacturing iuterests would have no existence. This state of tbings, howe ver, promises to be only temporary. Our export trade is rapidly increasing and include exports to the East, Europe, all parts of the Pacific coast from Alaska to Chile, to China, Japan, Australia, and all the Islands of the Pacific. They comprise over 50 distinct kinds of mannfactures. The

Labor

Required in the manufactures of this city forms uo less thau an eighth of the population or 21,070 persons. Of this number 8,049, or about 40 per cent. is Chinese. About 10,671, or ahout oue-half are white men, and the halance consist of white women, girls and boys. The average wages per year of each individual is ahout $593, or $13,043,861 in the aggregate. Deducting from the total value of the city manufacturers the products of refined gold and smelted lead, we had $50,676,465, of which the corresponding value of labor forms about 26 per cent. The corresponding value of material making the aame deduction is $25,197,153, forms 50 per ccnt. The balance, 25 per cent., would with reut, etc., deducted, leave a large profit and would were it distributed amongst the workers, add two-thirds to their wages.

The rates of wages for mechanics varies from $2.50 to $5 aud even $6 per day; the average is $3. That for laborers or helpers varies from $1 to $2.50 per day, but averages $2. That for women and girls varies from $3 to $20 per week, but averages $8. That for boys varies from $3 to $12 per week, but averages $6. Chinese labor is paid at the same rates as is that of boys.

Production.

Deductiug the value of the gold refined which we did not add last year to the total of manufacture, and also deducting the product of the rolling mill, sugar refineries, and some other industries which we were not able to ohtain, the manufactures of 1871 will be $47,600,000, as compared with $41,000,000 in 1870. This shows an increase of 16 per cent. during the year. The increase in capital has been 40 per ceut., and in material 16 per cent. The increase of production in the cigar maunfacture has been 100 per cent., in works in lumher, 66⅔ per cent., in leather and manufacturea, 20 per cent., and in textile fahrics 7 per cent. The following tablea give a full exhibit of everything of interest in connection with our manufacturing iuterests in 1871:

Establishments, Production and Capital.

Wine for London.

We uote this week a shipment of assorted wines to London. The geutleman who makes tbe ahipment has been a long time trying to persuade English people that California wines are fit to drink. The reply haa been, we have tasted them, and we pronounce dccidedly against them. This is the result of imperfectly cured wines bought at low prices; and often mixed—the mixture being sold as California wine.

At laat, people in Europe are being convinced, by samples of properly made wines forwarded to them, that California wines are worthy of attention. Consignors are daily expecting to receive favorable judgment, from a conaignment made to Hamburg; and, last week, our correapondent's samples hrought ordera from London for more California wines, of the same sort—7 varietiea.

It ia certain that our sunny climate produces wines of rich fruity bouquet, far aurpassing the wines of France and Germany; and it is also true that the uniformity of qnality, and the greater yield of our vines, year after year alike, and no such thing as failure, enables us to produce wine cheaper than in Europe. It is equally proved that our winea when stored above ground, instead of musty vaulta, attain hetter ripening in two yeara than European wines do in five years; besidea the great seasoning of the sea voyage hence to Europe. France wants land for the ataff of life; and we predict that ere 20 years have passed, it will be a national qnestion, if it would not be policy to turn uncertain vineyarda into wheat and to buy better and cheaper wines from California.

TRADE.—According to the most carefully prepared statistics the total value of the trade between the United States and Europe, for 1870, was $400,000,000, exclusive of bullion or specie, the imports of which from this conntry into England exceed $50,000,000 more. During 1871 England took from us products valued at $250,000,000, and exported in manufactures to the United States to the value of $156,000,000. The latter figures represent the products of Great Britain, Ireland and her numerons colonial possessions, the last mentioned, however, being less than $15,000,000 of the aggregate of merchandise shipped by us to Great Britain.

Useful Information.

The Latest Novelty.—Two weeks ago we called attention to a new use for electricity, in causing it to serve the purpose of an errand boy, etc. We have since observed still another novel application of this almost universal agent, in furnishing music for the various households of a town or city, from some central locality. The *modus operandi* is described as follows: "Let us visit the parlor. Our attention is first attracted by what appears to be a piano set in the wall. On opening it no key-board is visible; what is it? We smile and point to a printed programme of the 'Chicago Electro-Musical Society,' hanging on the wall, and then proceed to the explanation that at a central point pianos are played by celebrated performers, and how the keys of these instruments are connected with the works of our piano in the wall by electric wires. A look at the programme shows us that at 2 P. M. Signor So-and-so plays a grand fantasia, or 'Home, Sweet Home,' with his left hand, or performs some other musical feat. We glance at the clock, wait until the hands point to 2 o'clock, touch a knob, and in an instant away goes our piano, pouring out its flood of melody responsive to the touch of the Signor's nimble fingers; Are we tired of instrumental music, and do we prefer vocal? We break the connection and the Signor is silent. The telephone puts us in communication with the central office, so that we can hear every sound. Mlle Nilsson will perhaps favor us? Of course she will; no coughs or colds here; touch the knob, and strains of ravishing harmony entrance our senses."

Electricity. — We know to-day but little more of what electricity really is than did the ancient Romans, Grecians, or Egyptians. It is an agency or force which has never been seen, measured, or weighed, and in itself is as illusory, intangible, incomprehensible, as the "stuff that dreams are made of." All we know of it relates to its effects, and it is not probable that human knowledge will ever reach beyond this boundary.

It is a force that we have been able to put in harness, and by complying with the conditions under which it acts, we can compel it to serve important ends in benefitting the race. It is probable that at present we understand most of the laws or conditions which govern it, and that we have utilized the agency so far as it is capable of being utilized. Its relations to matter, and to the phenomena of life, are also quite well understood. This being conceded, it is evident that as yet we are utterly unacquainted with a sufficient number of forces to do the work of the universe. Every day the student and experimenter is brought face to face with phenomena which he is wholly incompetent to explain, and although electricity is a convenient agency to which to refer everything inexplicable, yet it is a very unsatisfactory packhorse upon which to crowd our difficulties.

There are many things yet to be learned, and proud as we are and have reason to be of our philosophy, as the ages roll on, what we know to-day will stand comparatively as the science and knowledge of the ancient Romans stand to the great light of the present age.

Household Electricity.—During the extraordinary clear cold weather which prevailed in February and March the electrical phenomena observed in some houses excited much interest In our own dwelling, for many days, no member in the family could walk across a room and come in contact with a metallic substance without receiving an electrical shock, accompanied with a spark and report. The door knobs, stop-cocks connected with steam radiators, gas-cocks, registers, etc., were so electrically spiteful that they were handled with caution. Our children amused themselves in the evening by lighting the gas with their fingers, and altogether the electrical condition of the atmosphere was quite unusual. In order that this exhibition of household electricity may be witnessed in perfection, it is necessary that the weather be clear and cold, and that the rooms be carpeted with heavy carpets, and these should be insulated by paper mattings beneath. Under these favorable conditions, a person shuffling or even walking across a room becomes so charged with electricity that he can ignite a gas-jet readily, by applying to it the tip of his finger. *Boston Journal of Chemistry.*

Simple Disinfectants.—As a simple method of employing carbolic acid, C. Homburgh, of Berlin, proposes to saturate sheets of coarse millboard with the disinfectant in question. The sheets may be hung up in the rooms requiring purification, or a small piece may be torn off when a small quantity only of carbolic acid is wanted. Sheets of millboard, having an area of about seven square feet, and containing about one fifth of a pound of carbolic acid, are sold in Berlin for a shilling apiece. Dr. Hagar gives the composition of a disinfecting paste for use as a washing powder. It consists of 100 parts of white clay, 1,000 parts of distilled water, and thirty-five parts of ordinary nitric acid. The mass thus obtained is allowed to stand for a few days, being stirred frequently. The supernatant fluid is then to be poured off, and the clayey mass thoroughly washed with distilled water. Five parts of permanganate of potash are now to be added, and the composition, when dried, is made up into tablets and wrapped in paper saturated with paraffin.

London, with a population of over four million, has only nine daily newspapers.

Catching a Cannon Ball.—Kett Holtum, the Prussian Hercules is astonishing the English by the truly novel feat of catching a ball fired from a cannon. The trick, though a clever one is said to be neither difficult nor dangerous. It is affected in this wise: About two ounces of powder are placed in the gun, then the ball is rammed home, after which the balance of the powder is put in. When the gun is fired, all the powder is ignited, and the flash, smoke, and report are orthodox, but the ball receives propulsion only from the small quantity of powder behind it, and is thrown but a few feet, and quickly picked up and exhibited to the admiring crowd.

Ancient and Modern Pavements.—Much has been said about the durability of the ancient Roman pavements, some of which have stood, with comparative little injury, for some 2,000 years. The great reason for this durability arises from the fact that the Romans had no occasion for disturbing their pavements for the laying of gas and water pipes, or for sewerage connections, as the inhabitants of modern cities have continually to do.

Mineral Caoutchouc.—A Parisian journal reports the finding, in Australia, of a mineral substance resembling caoutchouc in most of its characteristics. It contains 82 per cent. of an oily hydrocarbon. We shall be interested in any further particulars of this discovery, as they may lead, on future investigation, to the production, by synthesis, of one more organic substance.

Shaving With a File.—Some practical joker suggested through the *Scientific American* that rubbing the beard off with a pumice stone (a file would answer the same purpose) was a much better way than taking it off with a razor. Some fellow had the nerve to try it, and the result was that he got his beard off and skin too.

Mechanical Hints.

Fine Green Bronze.—First boil the work in a strong solution of potash to get off all the old lacquer and grease; next wash in clear water; after that let the work stand a day or two in a weak solution of nitric acid, then take out, wash, and dry; then coat the article with some good black lead. Polish until you have a good black, glossy surface; then put on yellow lacquer, which, upon a black surface, gives a green bronze.

Excellent Varnish for Harness.—Pulverize and put in a jug or bottle half a pound to a pound of gum-shellac, cover with good alcohol and cork tightly. Put the mixture in a warm place. In about two days, if shaken frequently the gum will be dissolved and ready for use. If the liquid appears as thick as thin molasses add more alcohol. To one quart of the varnish add one ounce of good lamp-black and an ounce of gum camphor. An occasional coat of this is also good for rendering boots waterproof.

The Industrial Monthly is the new title of the publication formerly known as the *Technologist*. It is a practical work, full of valuable information for the practical workingman—mechanic, manufacturer, builder or engineer—and sold at a price which the class for whom it is intended can afford to give. From it we take the following Mechanical Hints.

Dripping of Metallic and Slate Roofs.—Very often roofs which are perfectly tight, especially metallic and slate ones, are found to drip at certain times, generally when cold weather succeeds a few moist days. The explanation is obvious. During the damp weather the air in the building becomes saturated with moisture which, when the roof is chilled and the air in contact therewith reduced to a sufficiently low temperature, condenses on the roof and falls in drops on the floor. The remedy is to place a sheet of some non-conducting substance under the roof. Common heavy brown paper, or even newspapers, will answer and cost but a trifle. It should not be placed in contact with the roof, for it is the air enclosed between it and the roof which forms the protection. The paper itself is good for nothing; but when made to enclose an air-space, however small, it effects wonders.

Waterproof Glue.—We have recently met with a very useful form of cement for wooden or other similar articles which are employed for holding water or non-alcoholic liquids. Although the formula is not a very novel one, we know it to be useful and likely to suit the requirements of some of our readers. It stands as follows:—

Alcohol, (spirit of wine) 1 pint; sandarac, 1 ounce; mastic, 1 ounce; common white turpentine, 1 ounce; glue and isinglass, sufficient; water, sufficient. Dissolve the two resins—sandarac and mastic—in the spirit, and then add the turpentine to the solution. Make some very strong glue, and add to it a good pinch of isinglass. Now heat the alcoholic varnish until the liquid begins to boil, and then very slowly stir in the warm glue. The amount of the liquid glue to be added is determined by noting the point at which after thorough mixture, a magma or thin paste is formed capable of being easily strained through cloth. When required for use, the strained mixture is to be warmed and applied like ordinary glue to the articles to be united. A strong junction is effected, which is not destroyed by cold water, and only after a comparatively considerable time by hot water or ordinary saline solutions. *British Journal of Photography.*

Good Health.

The Color of Death.

Green, though so beautiful and healthful to the eye, has been most appropriately called "the color of death," for the reason that it invariably contains arsenic as one of its principle ingredients. Whenever we find this pleasing and popular color, it almost invariably contains this poisonous ingredient to a dangerous extent. It enters largely into nearly all the green upon our wall papers, lamp shades, paper boxes, toys, artificial flowers, confectionery, wearing apparel, etc. The popular color known as Scheele's green contains 55 per cent. (more than half) is composed of arsenite of copper—a most deadly poison. Scheele's green contains even a larger proportion of arsenic (58 per cent) in the form of aceto arsenite of copper. Both of the colors are more commonly known under the name of mineral or emerald green, and form the prettiest, most durable and cheapest shade of green which is made.

It recently came out, in the course of an investigation of the subject in Paris, that one manufacturer of wall paper in that city used up two tons of arsenic weekly! Paper hangings, perhaps, furnish the most prolific source of such danger. Chemical tests and post mortem examinations have fully proven, in great numbers of instances, that death from arsenic has been caused under conditions when the poison could not have been derived from any other source.

The manner in which the poison is communicated has also been made a subject of careful investigation. It has been found that a dust gathered up from rooms covered with green paper contains arsenic in quite noticeable quantities. In dry weather, especially, every jar of the wall, by the shutting of a door or otherwise, liberates from the paper a small portion of impalpably fine dust containing the poison. Every time the room, especially the wall, is dusted, large quantities are brushed off. This dust is inhaled while floating in the room, and hence the trouble.

Closet shelves are often painted green, the arsenic from which is readily absorbed when any warm or moist food, like bread, etc., is placed upon them. When we reflect upon the large amount of paint required to give a heavy, permanent color, and recollect the further fact that over half of that paint before being mixed with the oil is a deadly poison, there need be no wonder with regard to the danger to be apprehended from it. For even the common blocks of water colors, which come in little toy-boxes for children, the green color usually consists of about one-third its weight of arseniate of copper.

Dr. Draper of Boston, recently found that a sample of common *tarlatone*, procured from a shop in that city contained no less than 8¼ grains of this poison mineral to each square foot of the cloth. When we bear in mind the feeble manner in which mineral colors are held in cloth, some idea may be formed of the danger of handling or wearing such goods.

How to Test the Character of Green Paint.

It is within the power of every person to readily determine the character of green paint or color. Take a fragment of the paper or cloth and place it in a solution of ammonia. If arsenic is present the liquid will assume a bluish color. If a farther test is required take a little of the ammonia in which the paper or cloth has been allowed to remain for some hours and drop it upon some crystals of nitrate of silver. If arsenic is present, it will show itself by a yellow deposit on the crystals.

It is the cupidity, alone, of manufacturers, which induces them to use arsenic preparations in the production of their greens. A very good and durable green can be manufactured without the use of arsenic; but at the expense of rather more cost and skill, and perhaps some diminution in brilliancy. If the public would refuse to buy poisonous colors, they would soon be replaced by those from which no danger need be apprehended.

Buzzing in the Ears may be caused by organic disease of the auditory nerve or of the tympanum—by some *functional* disease of the nervous system, by congestion of the brain from any source, and especially by sexual debility or over excitement. Attention to general health should be practiced. Keep the circulation general and to the surface by proper bathing, rubbing, and exercise and ample clothing of the extremities. If it is persistent and troublesome notwithstanding the above precautions, consult a physician.

A majority of the idiots born are of intemperate parents; but this intemperance may be in the form of over work, or any thing that produces nervous exhaustion, as sensuality, the excessive use of tobacco, or disease of almost any kind. It is said that in the year 1865 there was a less number of idiots born in Norway than in 1855, and Dr. Dahl says it was because there was much less intemperance then than ten years before.

Raw beef, chopped up fine with onions, is now frequently to be seen on the counters in lager-beer saloons in New York. Germans are very fond of it, and they say it is the best cure or preventative of dyspepsia, as well as that of lung diseases.

To Dyspeptics.—If a man wishes to get rid of dyspepsia he must give his stomach and brain less to do. It will be of no service to him to follow any particular regimen—to live on chaff bread, or any such stuff—to weigh his food, etc., so long as the brain is in a constant state of excitement. Let that have proper rest, and the stomach will perform its functions. But if he pass fourteen or fifteen hours a day in his office or counting-room, and take no exercise, his stomach will inevitably become paralyzed, and if he puts nothing into it but a cracker a day it will not digest it. In many cases it is the brain that is the primary cause. Give that delicate organ some rest. Leave your business behind when you go home. Do not sit down to your dinner with your brows knit, and your mind absorbed in casting up interest accounts. Never abridge the usual hours of sleep. Take more or less exercise in the open air every day. Allow yourself some innocent recreation. Eat moderately, slowly, and of what you please—provided it be not the shovel and tongs. If any particular dish disagrees with you, however, never touch it, or look at it. Do not imagine that you must live on rye bread or oatmeal porridge; a reasonable quantity of nutritious food is essential to the mind as well as the body. Above all, banish all thoughts of the subject. If you have any treatises on dyspepsia, domestic medicine, etc., put them directly into the fire. If you are constantly talking and thinking about dyspepsia, you will surely have it. Endeavor to forget that you have a stomach. Keep a clear conscience; live temperately, regularly, cleanly; be industrious, too, but be temperate.—*Boston Journal of Chemistry.*

Sleeplessness—Diseased Bones. — I have heard it stated, and also read in medical journals, that if a person has taken very powerful medicine during a spell of sickness, it often destroys the nervous system to such an extent that the person never has sound sleep afterward. Do you think such is the case, or is there any way to recover so as to enjoy good, refreshing sleep again?

Ans. Loss of sleep depends generally on nervousness, the result of disease or of immoderate use of the various hypnotics, as morphine, hydrate of chloral, etc. But it would be quite impossible to give accurate advice without more intimate knowledge of the patient's temperament and physical condition.

Perhaps following a simple hygienic plan might assist. Let the patient exercise moderately, so as to be somewhat fatigued at bedtime; let the supper be light, if taken at all; let the bed be not feather, or the clothing too heavy; let the temperature of the bed-room be not higher than 58° or 60° F. Above all, give up all narcotics of every kind. A warm bath on retiring, with a hard rubbing or wiping dry, is often of service.

The diseased bone should be operated on *at once* by a competent surgeon, as the necrosis of the bone keeps up such an irritable state of the system that either medication or hygiene would be alike useless.—*Phrenological Journal.*

The Wear and Repair of the Brain.—The notion that those who work only with their brain need less food than those who labor with their hands is fallacious; mental labor causes greater waste of tissues than muscular. According to careful estimates, three hours of hard study wear out the body more than a whole day of hard physical exertion. "Without phosphorus, no thought," is a German saying; and the consumption of that essential ingredient of the brain increases in proportion to the amount of labor which the organ is required to perform. The wear and tear of the brain are easily measured by careful examination of the salts in the liquid excretions. The importance of the brain as a working organ is shown by the amount of blood it receives, which is proportionally greater than that of any other part of the body. One fifth of the blood goes to the brain, though its average weight is only one fortieth of the weight of the body. This fact alone would be sufficient to prove that brain-workers need more food, and better food, than mechanics and farm laborers. *Boston Journal of Chemistry.*

Poisonous Paper Collars.—A clergyman residing in Sussex county, Delaware, having been greatly troubled with numbness in his limbs, and other symptoms which led his physician to suspect lead poisoning, sent to us the ash resulting from the combustion of one of the paper collars worn by him, and we found upon analysis that it contained carbonate of lead in considerable quantity. This dangerous substance is used in the glazing of some cuffs and collars made of paper, and when the hands and neck perspire or any abrasion of the skin occurs, the lead is absorbed and poisoning results. The brand of collars containing the lead was represented to be what is known as the "Dickens" collars.

Vinegar Bitters.—Will you be kind enough to let me know whether you think that Dr. Walker's Vinegar Bitters are as good as he represents them to be in his advertisements, and greatly oblige.

Ans. We regard these bitters only less injurious than others because they contain no alcohol. But when the venders claim that they have any curative properties whatever, they claim that which is not true. It is, no doubt, one of the most—profitable to the makers—popular and harmless of the quack nostrums. Oh, the gullibility of ignorant, poor, sick humanity!—*Phrenological Journal.*

Table of Contents.

EDITORIALS.—The Recent Earthquake; Sewage Farming and Sewage Purification; Protection of Water Pipes in Mines; Calaveras County Mining Matters, 232. The "Lost Lead," 233.

ILLUSTRATIONS.—Crosby's Improved Furnace, 225. Loss of Quicksilver; Device for Lamp Chimney, 233.

CORRESPONDENCE.—Notes of Travel in Placer Co.; 226.

MECHANICAL PROGRESS.—Petroleum as Fuel in Iron Manufacture; Labor-Saving Machines; High-Speed Engines; Improved Canal Boat, 227.

SCIENTIFIC PROGRESS.—New Triumphs of the Chemical Laboratory; Mechanical Effect of Magnetism; Recent Observations of the Pla et Venus, 227.

MINING SUMMARY.—Reports from Mines in various States, Counties and Districts; Stock Reports; Leather and Metal Markets; Mining Shareholders' Directory, 229.

USEFUL INFORMATION.—The Latest Novelty; Electricity; Household Electricity; Simple Disinfectants. MECHANICAL HINTS.—Waterproof Glue; Dripping of Metallic and Slate Roofs; 231.

GOOD HEALTH.—The Color of Death; To Dyspeptics; Sleeplessness—Diseased Bones; Wear and Repair of the Brain, 231.

DOMESTIC ECONOMY.—Cookery; The Tea Hour; Boulli; How the Chinese Make Tea; The Farmer's Own Pudding; Influence of Wives, 235.

MISCELLANEOUS.—Sale of Mining Interests Unconstitutional; Wonderful Railway Bridge, 226. Trouble Among the Miners in Idaho; The Manufactures of San Francisco, 230. Patents and Inventions, 233. New Incorporations; Elections, 236.

THE BLACK HILLS REGION.—Secretary Delano, has written to Governor Burbank, of Dakotah, stating that he has been informed that a combination is being made to obtain lands in the Black Hill region for the purpose of getting possession of the mineral deposits and timber. The Black Hills are within the boundaries of an Indian reservation, and the Governor is requested to put a stop to any combination of the character mentioned, against the law. The Secretary has also addressed a letter to the Secretary of War with a view of securing the aid of the military in checking these expeditions. These proceedings will put a stop to a number of prospecting expeditions and will ultimately, no doubt, benefit parties who intended to go there, more than if they had gone. The reasons are that if large bodies of prospectors enter the country embraced in the reservation it will inevitably bring about an Indian War. Miners who have had any slight touches of "fever" and made up their minds to go there, will now have to give it up and remain where they are. When it becomes absolutely certain that the mineral resources of the country are of sufficient importance to warrant it, doubtless the Government will take proper measures to open the field for civilized labor and enterprise.

UTAH MINES.—Ten tons of ore from a mine in Butterfield Cañon, with a 7-foot vein, netted over $10,000 in silver and gold. A very heavy business was transacted last week in Salt Lake City, in the transfer and binding of mining property, the aggregate considerations in three days being over two millions. Several agents of English capitalists have lately come to Utah to examine the iron mines in Iron county. The ore is said to be abundant and of good quality. A Mining Stock Board is to be organized in Salt Lake City.

The Recent Earthquake.

The recent earthquake appears to have extended as far as the City of Mexico, for mail advices announce that a severe shock was felt in that city on the same day on which it occurred here. It was also quite severe at Camp Cady, Arizona, the vibrations being sufficient to move heavy government wagons several feet. Camp Cady is located upon the westerly side of the volcanic belt which extends from Inyo far into Mexico. The "tremblor" of the 26th ult. therefore extended as far north as the Oregon border and as far south as the City of Mexico, a distance of over 2,000 miles. How far it extended east and west we have no means of knowing, although we hear it was felt at Winnemucca, 462 miles east of San Francisco. A shock was felt the same day at Paducah, Ky., but no accounts have been received of any disturbances between Winnemucca and that place, and it is fair to assume that the Paducah shock was but a curious coincidence. The ocean was somewhat disturbed off San Pedro, but no vessels yet arrived have reported it as being noticed further out at sea.

The reports render it one of the most extended shocks of earthquakes recorded in history, and the pheuomena connected with it, near what is supposed to have been the central point of disturbance, are also remarkable, for we hear that the miners at Inyo, at work some 300 feet below the surface, at that point felt no shock. This fact, if it is a fact, coupled with the report of a similar absence of disturbance in the deep mines at Virginia City at the time of the severe earthquake which was experienced there some three years since, furnishes some new and interesting data with regard to the propagation of earthquake waves. The same law would seem to hold good in an earthquake disturbance that would attend a submarine explosion, the effects of which, would be propagated at a distance only by the concentric surface waves which would be origiuated directly over the point of disturbance.

The shock of the 26th ult. seems to have mainly followed the direction of the Sierra Nevada and Sierra Madre—southeastly and northwestly, although the volcano of Colima, in Mexico, on a westerly branch of the Sierra Madre, also burst forth in a state of eruption on the day of the shock, a fact which renders it extremely probable that there was some immediate connection with the activity of this volcano and the phenomenon observed in this State.

It is to be regretted that no steps have yet been taken, to have the data in connection with this remarkable terrestrial disturbance, collated by some persou of sufficient scientific attainment to make his report acceptable to scientific men.

LOW WATER.—The past year has been one of extreme drouth both on this continent and in Europe. So great has been the drouth that it has seriously affected manufacturing as well as agricultural interests. During the extremely low water in most of the streams, during last summer, numerous manufactnring establishments were entirely stopped. Much suffering was thereby caused to working men in many parts of Europe.

The low stage of water is given as one of the causes for the present extraordinary advance in iron—especially Sweed iron, which is largely employed in this country for the manufacture of steel. Paper has also been effected to some extent from the same cause.

CALIFORNIA STOCK EXCHANGE BOARD. The first annual meeting of the California Stock Board was held on the 8th inst., and the olection resulted as follows: President, T. J. L. Smiley; Caller, Joseph Tilden: Secretary, W. W. Lawton; Treasurer, E. J. Baldwin.

Sewage-Farming and Sewage-Purification.

Sewage-Farming Results.

We have previously spoken of the use of sewage in agriculture and of the results obtained in certain places. Although the question of how to deal with the refuse from sewers has attracted for a long time the attention of city officials in Europe, and although sewage farming has been practiced for some years, especially in England where several so-called "Sewage Farms" exist, yet sufficient data with regard to the results have not been obtainable.

J. Bailey Denton, in a paper read before the Society of Arts at London, has given some very interesting facts, and among them a table of the money realized by the sale of crops on sewage farms in certain localities. The figures show, at least, what is possible under proper management, and we condense the table, giving the average value of the crop per acre for several different crops. The farms, from which the crops were obtained, are all in England, but we give the values in American gold.

Crop.	Highest.	Lowest.	Average.
Italian Rye Grass.....$185.00		$ 63.50	$118.44
Mangolds..... 220 00		107.25	154.63
Swedes 131.25		71.66	98.89
Carrots..... 225.00		175.00	203.75
Parsnips..... 260.00		175.00	196.25
Cabbages..... 175.00		75.00	118.29
Potatoes 165.00		90.00	126.66
Onions 520.00		175.00	298.75

From these instances, as Mr. Denton remarks, sufficient proof is afforded that, with one crop per annum of a kind which will yield largely to the application of sewage and command a certain sale, the farmer can pay for the sewage a sum sufficient to make the sale of sewage remunerative and have still a handsome sum at his disposal. Although by good farming equally large crops have been produced without sewage, yet the united advantages of manure and water insure crops every year under every vicissitude of season and occasionally allow of two crops from the same land.

Purification of Sewage.

Intimately connected with the utilization of sewage and not to be separated from it, hy no means less important, and, indeed, sooner brought prominently before the public, is the purification of sewage. As soon as population concentrates in any locality, forming a town or city of any size, the question of dealing with the sewage from a sanitary point of view is forced upon the authorities, especially in inland towns. And as the country around becomes settled and industrial establishments spring up, the matter becomes one of paramount interest. The recent illness of the Prince of Wales, said to he traceable to impure water or sewer gases, has roused the anxiety of all the British nation, and presented the topic in a striking light. We cannot poison people or spoil streams hy letting the town refuse escape freely upon land or into running water. How then shall we deal with the refuse?

Of course the more thickly settled the country, the more important the subject. It is already becoming prominent in our land, and in Europe has long been a vexed problem.

England offers many attempted solutions of the prohlem. Of late years the A B C process—treating with alum, blood and clay principally—the phosphate process—using phosphate of alumina—and a few other chemical methods have heen loudly advocated; but no one has yet attained satisfactory results according to the hest information obtainahle. A new method, however, has lately been tried, and the results given are so favorable that we here publish a short account.

Denton's Intermittent Filtration Process.

This process has been tried in Wales. Twenty acres of land were divided into 4 equal parts, and the whole was drained to an average depth of 6 feet and deeply cultivated. The surface was laid out in the ridge and furrow form, to allow of the use of hoes and, while growing crops on the ridge, to permit the sewage to flow in the furrows and rise up to the ridge sides with a certainty of being ahsorbed and of feeding vegetation at the same time. The sewage was equivalent in amount to the discharge of about 30,000 persons. This sewage being let out upon the land, was filtered in its progress from the surface to the drains, depositing in the soil its material so heneficial to agriculture, and issuing from the drains so pure that the lahorers were said to quench their thirst with it, and chemical analyses showed it to he of a quality unobjectionahle in a sanitary point of view. The yield of the crop sown is also given as very good. We find the value of the crop of cabhages per acre given as $100.

Protection of Water Pipes in Mines.

Much complaint is made by miners on the Comstock lode in Nevada, and in many other mining localities on this coast of the manner in which iron water-pipes give out under the biting touoh of the vitriolic impurities of the moisture distilled from the crevices of the rock. Galvanizing or coating with zinc give practically no protection from corrosion, and indeed no available remedy is known.

The same difficulty is experienced in the mines in many parts of Europe; and in those of Siberia, where pyrites are common, the trouble is said to be now very effectually avoided by a novel method of enameling the internal surface of the pipes, which is described by the American *Artizan* as follows: "The process involves a preliminary exposure of three hours to a bath of oil of vitriol—sulphuric acid. After this they are washed with water, and are brushed with a composition composed of thirty-four parts silica, fifteen of borax, and two of soda, and are then placed in a retort at a dull-red heat for about ten minutes. This is the first coating. A second is laid on, composed of thirty-four parts of feldspar, uineteen of silica, twenty-four of borax, sixteen of tin oxyd, four of fluorspar, nine of soda, and three of niter. This is melted to a mass in a cruclble, then ground to a fine paste with water, and in this condition applied to the pipe, which done, the pipe is heated to a white heat, and maintained thereat for twenty minutes. This insures the perfect fixing of the enamel. Before the pipe has become wholly cool it receives an external application of coaltar, and is then ready for use. There seems no good reason why pipe treated in this manner should not prove well adapted for purposes for which, owing to its inability to corrosion ordinary iron pipe is inadmissible.

CALAVERAS COUNTY MINING MATTERS.—The mining prospects in Calaveras County are, like they are all over the Stato, in a flourishing condition. Quartz mining in particular, stimulated by successful results in Lower Rich Gulch, West Point, Railroad and Angels, has taken a new impetus. The Mokelumne Hill *Chronicle* is jubilant over this increased interest and says that "work is being resumed in mines long since abandoned, ledges are being prospected in every direction, and, better than all, capital has come to the assistance of energy and enterprise." In the West Point, Railroad Flat and Mosquito districts, in the northeastern portion of the county, favorable developments have been made this spring, though active operations have not yet commenced. From West Point, particularly, the intelligence received is very flattering. The developments on the Zacetara mine have established the permanency of the leads in that district. In Railroad Flat, first class quartz is coming from the Petticoat, Wolverine, Prussian Hill and Free & Easy mines. At Mosquito Gulch, the San Bruno, Good Hope and Grasshopper leads, though not large ledges, pay well. At Rich Gulch the well known Gwin Mine, one of the best appointed in the State is doing well and operations are being extended. At San Andreas the Thorn and Scifford mines are in operation, the former having been bonded for $80,000. At Angels the "Big Mine" and Stickle claim are paying handsomely. Gravel mining is flourishing, and the supply of water being pleutiful, it is expected that more gold will be turned out this year than during any previous one.

HONORS TO PROFESSOR MORSE.—The National Academy of Design have adopted resolutions of respect to the memory of the late Prof. Morse. The Aldermen, assistant Aldermen, and the City Councils of New York and Brooklyn and the Chamber of Commerce, of New York; and likewise, the Board of Directors of the Western Uuion Telegraph Company, have also adopted a series of resolutions of like character. Similar measures have been taken all over the country.

Loss of Quicksilver.

[Written for the Press by Guido Kustel.]

With reference to the article under the above heading in the Scientific Press of March 16, 1872, the way to ascertain the amount of quicksilver in the crude bullion or retorted amalgam should be added. There are cases where the bullion shows the appearance of a perfect retorting, where there is, nevertheless, a considerable amount of quicksilver; and again, sometimes much of the latter is supposed to be present where only a small percentage will be found. Occasionally it may be of importance to know the quantity of quicksilver in the bullion in order to decide whether it would be profitable to subject it to another retorting or not. The assay is done correctly in a few minutes by my method, requiring only a glass tube, an alcohol lamp, blowpipe, and a gold cornet. The latter may be procured from any assay office where gold bullion is received, and one cornet will serve for many years. To make this way of assaying easily understood, it might be better to explain it by an example:

First, take the cornet on a piece of charcoal and make it red-hot by means of the alcohol flame and blow-pipe, but carefully, for by applying a little too much heat it would melt. It is safer to take the cornet on a needle, and to hold it in the flame a few seconds till it gets red-hot. Weigh it out on a fine gold balance and notice the weight of the cornet, say 634.75 (equal to 6.3475 grains). The weight will always be found the same after use when calcined, provided no fragment has been broken off accidentally. If it should weigh a little more after being heated this must be repeated.

Next, take a small fragment out of the middle of the broken bullion, best in one single piece, not heavier than from 150 to 200, (1¼ to 2 grains,) weigh it correctly and note it, say 170. This bullion fragment of 170 insert into a glass tube, the one end of which you close by melting it in the alcohol flame. The fragment *a*, in the drawing (of natural size) is placed at the end of the tube, and then the gold cornet *b*, in a distance, is represented.

Take hold of the tube as shown with the fingers, and let the alcohol flame play over the part of the tube in which the bullion is placed. The quicksilver will soon be observed as a gray coating at *d*, which, by increased heat, moves slowly towards *b*, and is taken up by the gold cornet. After one or two minutes steady blowing, take the blowpipe and direct the flame on the bullion *a*, turning the tube slowly between the fingers. The glass tube will commence to melt by the increased heat and the rest of the mercury will be driven out. One minute blowing is generally sufficient. The tube is then allowed to cool down, keeping or placing it always horizontally, to prevent the sliding of the cornet. When cold, the cornet is rolled for a while in the tube, in order to take up some quicksilver globules that might be perceived in front or behind the cornet, and if, by means of a magnifying glass, it is observed that no quicksilver adheres to the sides of the tube, it is held inclined a little so that the cornet may slide out.

At one end the cornet appears gray from quicksilver, the other shows pure good color. With this end it is placed on the balance as shown in Fig. 2, so that the amalgamated part is turned up, and weighed out. For this purpose the cornet must be examined with a magnifying glass, to be sure of there being no quicksilver on one end, otherwise it would amalgamate the gilded cup of the scale, and cause much trouble in adjusting the balance afterwards. In such a case it is best to put a small piece of paper on the cup, weigh it and the cornet together and subtract the paper weight from the cornet. After weighing, notice the weight, say, 640.50; from this take off the weight of the pure cornet, 634.75. It gives a difference of 5.75, the amount of quicksilver obtained from the bullion fragment, weighing 170. The percentage of quicksilver in the bullion is then easily found.

$$170 : 5.75 = 100 : x$$

$$x = 575 - 170 = 3.38 \text{ per cent. of mercury.}$$

The gold cornet is annealed again in order to drive out the quicksilver. It must show its former weight. It should always be glowed and weighed before and after use.

This method of determining the amount of quicksilver in the bullion is also applicable to assaying quicksilver ores, with

Fig. III.

Fig. II.

proper modification. It gives a more reliable assay than the usual way of assaying by retorting small quantities, especially with poor ore, containing from 1 to 2 per cent. of quicksilver. The ore must be dry and finely pulverized. Of this 100 milligrammes are weighed out, or 50, if over 20 per cent. quicksilver is supposed to be in the ore, and by means of a capsule introduced into a glass tube, into which a paper tube, *a*, as represented in Fig. 3, has been inserted. A few slight taps are applied on the tube to clear the sides of the paper tube, and then about three times the volume of the ore of carbonate of soda, *c*, is introduced over the ore, *b*.

The paper tube is then drawn out and the sides of the tube appear clean and clear. It must be mentioned yet that it is very important to drive out the water from the soda before use, by heating it in a porcelain or platina cup to nearly a red heat. When so prepared, the gold cornet is introduced again as described before, in a horizontal position, and the end containing the ore cautiously heated. If suddenly held in the flame, the soda might be thrown against the cornet. After five or six minutes, the heat must be increased by help of the blow pipe, which will cause the soda to melt. When cold, the quicksilver globules adhering to the side of the tube are collected by the gold cornet as mentioned before. The weight above that of the cornet expresses the per centage of the quicksilver in the ore, provided 100 milligrammes have been weighed out.

If it should be observed that some water has precipitated inside the glass tube near the opening, it would not be safe to weigh the gold cornet directly, but it must be first dried in a wider glass tube, which is kept for a short time in boiling water

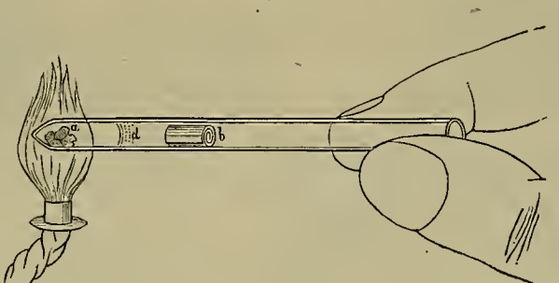
A Device for Preventing the Breakage of Lamp Chimneys.

The accompanying cut is a representation of a device for preventing lamp chimneys from breaking or cracking, by the contraction and expansion of the glass, under ordinary heat and usage. This device consists of a piece of metal which is made of the shape shown, and is suspended on the upper end of the chimney so as to hang down a short distance in it, which, the inventors claim, serves both to regulate the draft and equalize the heat.

The greatest disadvantage there is in using

lamps is the frequency with which the chimneys break, and numerous contrivances have been made to obviate it; this the inventors say will effectually prevent the breakage, as has been fully proven by numerous experiments. The

Fig. I.



piece of metal can of course be applied on any chimney, and it is claimed that by its use the flame may, even when first lighted, be turned up so as to come out at the top of the chimney without breaking the glass by sudden expansion. The cause is attributed to the division of the draft at the upper end of the chimney by the hanging plate whereby it is steadied and the heat regulated. This little invention has been patented through the Scientific Press Agency by C. M. Gruhy and T. I. Lichtig. The agent is O. V. Gerzabeck, No. 563, Market street,

Railroad Convention.—Circulars have been received by a number of persons in this city, calling their attention to the fact, that a Convention of Railroad men and engineers, interested in the narrow gauge system, will be held in St. Louis on the 10th of June. The following persons are requested to attend: Officers of narrow-gauge roads, constructed, in course of construction or projected; all dealers in, or manufacturers of narrow gauge rails or equipments; all railroad engineers. A committee of arrangements has been appointed, and an excursion to Denver City, where the Denver and Rio Grande narrow-gauge railroad is in operation, will be a feature of the Convention.

The work of pumping out the Bellingham Bay coal mine is progressing slowly but satisfactorily.

Patents & Inventions.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports to Dewey & Co., U. S. and Foreign Patent Agents, and Publishers of the Scientific Press.]

For the Week Ending January 3d, 1872.

Paper-File.—Jeremiah W. Foard, S. F., Cal.; antedated Dec. 20, 1871.
Buckle.—Nathaniel D. Fowler, Valley Ford, Cal.
Railway Switch.—William H. Masterman and Andrew Jackson, Stockton, Cal.
Device for Steading Wagon-Poles.—Reuben Austen Seaders, S. F., Cal.
Broadcast Sower.—Jacob price, San Leandro, Baptist Johnson, Irwin J. Truman and Robert M. Hamilton, S. F., assignors to Livingston L. Baker and Robert M. Hamilton, S. F., Cal.

For the Week Ending January 10th.

Carriage Wheel.—Charles Palmer, Hamilton, Nev.

For the Week Ending January 30th.

Rotary Pump.—Nathaniel P. Sheldon, S. F., Cal.
Curing Leaf Tobacco.—James D. Culp, Gilroy, Cal.
Artificial Teeth.—Charles H. Mack, Portland, Or.

For the Week Ending February 6th.

Grain-Separator.—Joseph Esse, Redwood City, Cal.
Horse-Power.—Samuel Pelton, Marysville, Cal.
Apparatus for Exhausting Air from Preserve-Cans.—David N. Phelps, San Leandro, Cal.
Bung.—Daniel B. Rickey, S. F., Cal.
Manufacture of Alcoholic Spirits.—Ianthia J. Rolfe and Josiah Rogers, Nevada City, Cal.
Dish-Washing Machine.—Catharine Woodruff, Antioch, Cal.

For the Week Ending February 13th.

Horse-Power.—Thomas C. Churchman, Sacramento, Cal.

For the Week Ending February 20th.

Gopher-Trap.—John Bowman, Santa Cruz, Cal.
Material for Filling Matresses, Making Paper, Etc.—Francis C. Cone, S. F., Cal.
Amalgamator.—George C. Langtry and George Emmett, Gold Hill, Nev.

For the Week Ending February 27th.

Wood Pavement.—Henry E. Perry, S. F., Cal.

For the Week Ending March 5th.

Grain-Separator.—James C. Bowden, Farmington, Cal.
Endless-Rope Way.—David R. Smith, S. F., Cal., assignor to Andrew S. Hallidie, same place.

For the Week Ending March 12th

Oang-Plow.—Samuel D. Bowen and Americus M. Abbott, Stockton, Cal.
Brick-Kiln.—Francis Felix Boudrye, S. F., Cal.
Permutation Lock.—William C. Busse, S. F., Cal.
Machine for Painting Wire-Cloth.—Samuel Graves, S. F., Cal.
Oang-Plow.—George W. Haines, Maino Prairie, Cal.; antedated March 7, 1872.
Friction Engine.—Wallace Hanscom, S. F. Cal.
Extension Shelf or Bracket.—Anthony Rosenfield, S. F., Cal.
Quartz-Mill.—William C. Stiles, Nevada City, Cal.

For the Week Ending March 19th.

Medical Compound or Rheumatic Liniment.—John M. Cantrell, Polk county, Or.
Wheel for Vehicles.—George R. Duval, Salem, Or.
Submarine and other Walls.—William H. Foye, S. F., Cal.
Harrow.—Oradon J. Leabo, Forest Grove, Or.
Apparatus for Lighting and Extinguishing Gas by Electricity.—John Vassant, S. F., Cal.
Animal-Trap.—James William Fishback How, Canyonville, Or.
Spice-Bottle.—Joseph L. Likins, Vallejo, Cal.; antedated March 14, 1872.

Note:—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency

The "Lost Lead."—Recent advices from Arizona chronicle the discovery of what is supposed to be the long-sought-for "Lost Lead," within abont 10 miles from Mineral Park, Wallapai District. An old tunnel has been found containing the tools of workmen, and the ledge is said to be a fine large one showing considerable horn silver. The old dump covers an acre of ground. The "Lost Lead" has formed the foundation for air-castles for many a miner in the "lower country," and has been sought for by thousands. Its existence is attested to by the annals of several of the Old Missions as well as by the traditions of the Indians. It was generally supposed to be located somewhere in the San Gabriel range or the San Bernardino mountains, and it is said that the old bells of the church at San Gabriel were made of silver obtained from the mine by the Jesuit Priests. When the Burro mines were discovered, many people supposed that the lost lead was somewhere in that vicinity so that the range of country in which it was supposed to be situated, was rather inflammable for any systematic prospecting. Whether this newly-discovered tunnel is one of the old mines referred to or not, it is nevertheless valuable, and somewhat singular, that, with a dump "covering an acre of ground," it has not been found before. Doubtless the former owners were driven off by the hostile Indians.

Gold Yield.—The gold yield of Nevada county for the past two years has been $5,000,000 per annum, and it is estimated that, for the present year, it will reach $7,000,000.

Domestic Economy.

Cookery.

A celebrated *chef* in Paris, once composed a marvellous *entree* from two or three paire of soiled wbite kid gloves, and snceeded effectually in deceiving tbe palate of a connoisseur. Could tbe baeis of any *plat* be more economical? Tbe gonrmet who dines off truffled turkey, turtle, and ortolans, most certainly employs good cookery, but cannot claim to be cousidered an economist; while, on tbe otber haud, the mutton cbop of the epicure in bumbler life may he rendered a delicate and palatable repast, ae well as strengtheniug and refresbing to tbe eystem, by the agency of good cookery, whereas bad cookcry will destroy tbe nutritive properties of the meat, and renders the chop a lump of coucentrated indigestion. Brillat Savarin has said, in his admirable work on gastrouomy, that "a great cook is a greater man tban a great astronomer," and it is to be regretted that tbie work has never been translated into tbe English langnage for the benefit of those of his disciplee who practice the art, but who do not nnderstand the French language.

Give a real culinary artist fuel and materiale, and the science of cookery in such hands will prove a fathomless mine of inexhanstible variety, a boundless source from whicb will spring delicate dishes, mysterious and refined. It is sometimee said :—"There is nothiug new under tbe sun;" but the chemistry of cookery refutes the axiom; for wheu the *Almanach des Gourmands* was pnblished by De Perigord, people said that he had surely expended tbe sum of his knowledge on tbe dishes contained in tbe first year'e nnmber; hut another year, and yet another, saw issuing from that marvellons brain of that prince of cooks the endless coil of gastronomic delight, until evcn variety became monotonons, and the traducers of the art were eilenced.

The higher the state of civilization in any country, the greater is the perfectiou to which the art, or rather the scieuce, of cookery is brought; for cookery is more a scieuce tban an art, the result of study tban of natural talent. The untanght cook can never make a good eonp, and a lifelong experience, reflection, study, and practice, are necessary to prodnce a Careme, a Ude, or a Gouffé. There is very much to be said in favor of the simple and undisguised form of good cookery, and in adapting the art to the refinemente of civilizatiou, we contend that we are redncing, not increasing, the cbance of indigestion; while on the one hand we would avoid tbe meagre fare of a miser, on tbe other we would inveigh against the coarse gluttony of a gourmand. The leg of mntton in tbe hande of a Freuch woman forms a delicious tureen of palatable and nourishing soup, as well as a substantial joint, ae *bouilli* or *braise*; bnt our American woman's ideas rarely rise above the oven; and the result is too often an unpalatable, greasy dish, of which all that cau be said is, that it staye the cravings of hunger at the expense of the digestive organs. Our cookery in lodging honses ie detestable, and may be summed np in one word—grease. In our middle classee very little skill is shown in the preparation of food, and amongst the poor none whatever.

In caees of extreme debility, good cookcry is a *sine qua non* to recovery; tbe invalid cannot digest tbe greasy, nauseous beef-tea of ordinary life; aud tbe weak, washy stuff, too often imbibed, has led, if not to the utter prostration of many an already declining constitution, at least to a daugerous state of wild irritation in tbe digestive organs. Hence our medical men refer their patiente to the great inveution of the world-renowned Liebig; but speaking as a practical cook, I nnhesitatingly assert the superiority, both in flavor and nutritive properties of good beef-tea made scientifically from fresh beef, over any concentrated essence of beef yet invented.

The reasons for this are many and obvions, aa the process of strong concentration mnst destroy in some degree the delicate nature of the eesence of tbe meat. But we must leave, as we have before said, tbe subject of dietetic cbemistry iu the hands of ahler and more expert advocates—meu wbo bave given their time aud attention to it. Yet in the discussion of our subject we mnst trench a little upon it, as chemistry and cookery are twin eciences, if not branebes of the one and tbe same science; for tbe skilled cook, like the chemist, amalgamates hie materials with a due regard to their differeut natures, and at such periods in tbe process of cooking as careful consideration has taught him will render them most amenable to tbe chemical action of fire; any deviation from the proper quantities, time, or degree of heat, are fatal to snccess, and would prodnce a totally different result, in many instances, from that desired. Heuce the necessity for mnch care and study, ere the tyro ventures to essay his skill in tbe practice of the culinary art.

If we admit the primary expense of good cookery (which we do not), we say that it is most economical in the long run, for it will be found to reduce the doctor's hill; and no one is londer in praise of scientific cookery artistically administered than the medical man of the present day. We tbink that enough has been urged for the cauee of cookery, to persuade our readers tbat thie is a subject of vital importance to them all, and may claim ae mucb of their attention as any other phase of sanitary reform, or any qneetion of public safety.—*Food Journal*.

The Tea Hour.

Tbe tea hour, in tbousands of bappy homes, is tbe hour of tbe day looked forward to witb most intense deligbt, as it calle around the table the members of the household after the various cares and labors of tbe day are completed, and a season of rest and social interconrse is anticipated. The dining hour is with most people the time when the appetite ie craving, and the sense of hunger is apt to beget a considerable amonnt of impatience or perhaps fretfulness.

If tbere is any hour in the day when the man of business is nnamiable or testy under his own roof, it is just before dinner, when he is waiting for the signal wbich is to summon the family to the dining room. Children, guided hy tbeir qnick iustincts, seldom ask for favors at such unpropitions moments; and often family pete, the dogs and cats, learn to skulk away into some quiet corner, aud wait uutil the meal has fairly begun, before they venture to intrude themselves into chairs, or come within reacb of tbe paternal boots.

Dinner may be called tbe *business* meal; it is the one wbich regnires tbe most labor and expense to provide, and it is too apt to he partaken of when the mind is loaded with the business perplexities of the day. In the natnre of things it cannot he the season wben the family shut themselves iu from the outside world, and turn the current of their thoughts upon pleasant themes.

At hreakfast there is more or less hurry. The mind, refreshed with sleep, is elastic, confident, eager to enconnter tbe labors and duties wbich have come with tbe morning sunlight, and there is little incliuation to talk or think of other matters tban those wbich are connected with tbe work of the day. It mnst be conceded, tbat in this conntry the tea hour is the time, and the tea table the place for the introduction of topics of conversation which require a forgetfulness of everything tbat is personal or selfish. It is pecnliarly the time and place for social converse upou the wonderfnl and beantiful tbings iu Nature, whicb modern research has so clearly nnfolded, and which when nnderstood are so well calculated to make ns not only wiser hut better.—*Journal of Chemistry*.

In view of the above is it uot the duty of every parent to introduce at the table topics of conversation such as will interest and improve the minds of the youuger members of the family? Every number of the Press contains mauy articles which might he profitably introduced as tbe basis of such conversations. There is no family whicb may not be made wiser, happier and better by having its thoughts while at the table turned npon iuteresting facts in science aud art, as presented in the various useful aud instrnctive publicatious uow being constantiy thrown off from tbe weekly periodicale of tbe day.

Boulli.—This term is rather a misnomer; eince bonlli is understood nsually, like "consomme," to meau that portion of meat which is left from the soup and is served at the same time. However here is my boulli :

To eight pouuds of beef put three quarts of water, two onione, four carrots, three parsnips, three stalks (or celery leaves) of celery, qnarter of a head of cahbage, (wbich may be left ont,) three tomatoes, one pod of red pepper, parsley and allspice—beans and ochre are an improvement. Cover close and boil all togetber for four honrs—put in fonr potatoes and boil an hour longer—tben take out tbe vegetahles, mash them, add butter rolled in flour to tbickeu the gravy; return all to the pot and serve meat and gravy on the same dish. In all soups and stews, a common fault is too little water at first, and then adding to the qnantity, and fast boiling in an open pot, will spoil many a good dish. Of course in this as in most other things, some judgment mnst be nsed and different tastes consnlted, and many wonld donbtless prefer donble the number of vegetables. Tbe beef may be from tbe round, rump or brisket.—*Ex.*

Potato Salad.—Any one who has eaten potato salad at a Parisian hotel will be glad to try it after he gets home. The following is a good formula for the simple hut delicious preparatiou. Cnt ten (or twelve cold boiled potatee iuto slicee from a quarter to half au inch tbick; put into a salad bowl with four tablespoonfuls of tarragon or plaiu vinegar, six tablespoonfule of best salad oil, one teaspoonful of minced parsely, and pepper and salt to taste; stir well, tbat all he tboroughly mixed. It should be made two or three hours before needed on the the table. Aucbovies, olives, or auy pickles may be added to the salad, and also bits of cold beef, chicken or turkey if desired; but it is excellent without these.

Syrup of Coffee.—Tbis preparation is of great nse to tbose wbo have long journeys to make. Take half a pound of the best ground coffee; pnt it into a sancepan, coutaining tbree pints of water, and hoil it down to one pint. Cool the liquor, pnt it into another saucepan, well scoured, and hoil it again. As it hoils, add white sugar enough to give it the consistency of syrup. Take it from the fire, and when it is cold put it into a bottle aud seal. When traveling, if yon wish for a cup of good coffee, yon have only to put two teaspoonfuls of the syrup into an ordinary coffee-pot, and fill with boiling water. Add milk to taste, if you can get it.

How the Chinese Make Tea.

Among the newspaper articlee floating around the country and turuing up periodically ie one entitled "How different nations make tea." It commences thus: "The Chinese place tbe tea in a cup, pour boiling water npon it, and driuk the infusion off tbe leaves." Now this is wholly erroneous. The Cbiuese method is far snperior to that commonly followed in the United States and Enrope for "drawing tea." Tbey take uo sugar or milk iu their tea, and never hoil the leaves, thereby dissipating all the delicate aroma, as we do. They bave a small basket, lined with woolen felt, from an inch to two inches in thickness, and with a cover padded in the same manuer. Into this a tea-pot of common Chiua porcelain is fittcd tightly. When tea is to be drawn, they put the dry leaves into tbe porcelain tea-pot, pour boiliug water upou them, put on the lid, and close the felt-lined cover of tbe basket tightly down upon it. The felt retains the heat for from six to twelve hours, and at any time during tbe day you can pour a cup of tea, scalding bot, fresh, clear and deliciously aromatic, from tbe nose of the tea-kettle, which protrudes from a hole througb the side of the basket. Fuel is tbus economized, and the tea is infinitely better than can be produced from the same grade of leaves by auy otbcr process. Tbis tea-pot and basket can be procured at auy first-class Chinese store, and a single trial will satisfy the most eksptical that our housewives are far hebind tbe semi-barbarians of the Orient iu tbis branch of their husincss. We do a little better on coffee; bnt still, ae a rule, we are far behind the natives of coffee-producing countries in preparing it for tbe table; and chocolate, the most delicate and nourishing of all tbe bibnlons luxuries of tbe table, we ntterly ruin. —*Call.*

The Farmer's Own Pudding.—Three ponuds eifted coru meal, three-quarters of a pound finely minced beef suet, one pound dried currants, (well-washed and rubbed dry,) one-half teaspoonful of soda, (supercarhonate;) iucorporate the wbole, while dry, aud add one and a half pints of molasses, a sufficient quantity of boiling water, stirriug hard all the time nntil the mixture is of the cousistency of common mush: stand over night iu a moderately warm place; next morniug tie it in a wide-mouthed bag, leaving it full space to swell; boil incessantly four or five hours (a plate placed in the bottom of the pot;) served with boiled or hard sauce, according to taste, tbe same as with pnding. By many, this pudding is considered even better when heateu in tbe oven next day. The above recipe makes a quantity sufficient for tweuty people.

Prepared Corn-cobs.—A very couvenient kindliug wood is made in France from corncobs, by immersing them in a mixture of sixty parts of melted resin and forty parts of tar; after which tbey are takeu out and allowed to dry. Tbey are then subjected to a second operation, wbich consists in spreading tbem out ou a metallic plate heated to 212° F. They are finally assorted according to eize, and tied up in bnndles. Tbese are sold at the rate of tbree or four for a ceut. Tbe establiehmeut in Paris for manufacturing them employs tbirty workmen, and effects sales to the amount of $40,000 annually.

A Relish for Breakfast or Lunch.—Take a quarter of a ponnd of good, fresh cheese; cut it up into thin slices and pnt in a spider, turniug over it a large cupful of sweet milk; add a qnarter of a teaspoonful of dry mnstard, a dash of pepper, a little salt, and a piece of butter as large as a hutternut; stir the mixture all the time. Have at hand tbree Boston crackers finely powdered or rolled, and sprinkle tbem in gradually; as soon as tbey are stirred iu, turn qbe contents into a warm dish and serve.

Sweet Potato Balls.—First boil tbe potatoes, then carefully mash the farinaceous part. Boil in the mean time a pint of milk, pnt in some lemon peel, a couple of small lumps of sugar, and a little salt. When the milk boils, take it off of the fire and add the potatoes, so as to form a paste, or ratber a tolerably thick mush. Wben cool, make it into balle; cover these with crumbs of hread and yolk of egg. Fry to a nice brown color, and serve up with eugar strewed over them.

Influence of Wives.—It was not all a dream which made the wife of Julius Cæsar so anxious that he should not go to the State Chamber on the fatal Ides of March; had he complied with her entreaties, he might have escaped the dagger of Brutus. Disaster seemed to follow disaster in the career of Napoleon from the time he ceased to feel the balance wheel of Josephine's influence on his impetuous spirit. General Washington, when important questions were submitted to him, often has said that he shonld like to carry the subject to his bed-chamber before he formed his decisions; and those who knew the clear judgment and elevated purpose of Mrs. Washington thought all the better of him for wishing to make her his confidential counsellor. Indeed, the great majority of men who have acquired for themselves a great and good name, were not only married men, but happily married—both paired and matched.

PACIFIC STONE COMPANY.

Ransome's Patents International,

For wbicb Commissioners for the Exhibition of 1862 awarded the Prize Medal, and Gold Medal at tbo Mechanics' Institute Fair, 1871, of San Francisco.

REMOVAL.

This Company bavo removed from the corner of Turk and Larkin streets, to their new and Commodious works corner of Greenwich and Octavia. They have established an office and salesyard at the Junction of Market and Bush, where they will keep constantly on hand an assortment of ORNAMENTAL, BUILDING, CEMETERY and GRINDSTONES. Orders will be received at the above office from all wbo wisb to get good work at low prices. Send for Circular. 5v24-3amslamrly

The California Powder Works

No. 314 CALIFORNIA STREET,

SAN FRANCISOO.

Manufacturers and have constantly on hand

SPORTING,

MINING,

And BLASTING

POWDER,

Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It belng constantly receivcd and transported into the Interior, is delivered to the consumer within a few days of tho time of its manufacture, and is in every way superior to any other Powder in Market.

We have been awarded successively

Three Gold Medals

By tbe MECHANICS' INSTITUTE and tbe STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

HERCULES POWDER,

Which combines all the force of otber strong explosive now in use, and the lifting force of the BEST BLASTIN POWDER, thus making it vastly superior to any other pompound now in use.

A circular containing a full description of tbis Powder can be obtained on application to our Office.

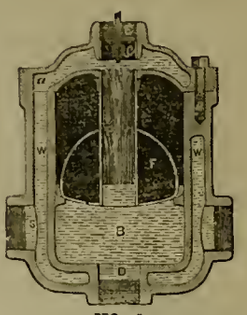
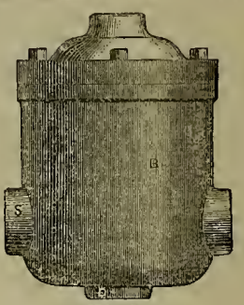
CRAIG & BREVOORT'S
Patent Condenser for Steam
PUMPS, &c.


NO. 1.
The annexed engravings represent a Condenser intended to be attached to the ordinary steam pump, thereby bringing it within the class of low pressure, or more properly speaking, of condensing engines; the steam, when it has done its work in the cylinder, instead of being exhausted into the atmosphere, is conducted to the condenser, on its entry into which, it meets the water drawn by the pump, and is immediately condensed.
The Cut No. 1 represents a vertical section of the Condenser, and No. 2 an elevation.
The flange D is bolted to the suction orifice of the pump, and the flange S to the pipe leading to the well, or whatever source of supply the pump may have; W is a water jacket surrounding the main chamber of the condenser, B, and with which the suction pipe, S, communicates, permitting a free circulation of water within the jacket and into the hollow cover or top through the series of openings, one of which is shown at A, and from thence into the body of Condenser, B, through pipe P, carried by float F, the pipe P also acts automatically as a valve to enlarge or contract the space through which the water enters it, by which means the possibility of the condenser being at any time flooded is avoided. The pipe P, it will be observed, also acts as guide to float F.
The valve, O, (shown in Cut No. 1), which is raised or lowered by means of screwed stem—shown coming through elbow in Cut No. 2—is for the purpose of increasing or decreasing the flow of water according to the capacity of the pump to which it is attached.


NO. 2.
The exhaust pipe from steam cylinder is screwed into cover at E; the exhaust steam is thus thrown directly into contact with the water entering the condenser on its way to water cylinder of pump through D. A vacuum being of course immediately formed, acts on the exhaust side of the steam piston, aiding it in its work. If at any time it is desirable to run the pump without the condenser, it is only necessary to turn the three-way cock, which is placed in the exhaust pipe, into such a position as to cause the steam cylinder to exhaust into the atmosphere; when this is done the pump is perfectly free from the condenser, and acts as if it were not attached. This condenser is specially useful for pumps running in mines, or any other position where trouble is experienced in getting rid of the exhaust steam. Address H. L. BREVOORT,
6v23eowly 128 Broadway, New York City.

Varney's Patent Amalgamator.
These Machines Stand Unrivaled.
For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.
They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.
This Amalgamator Operates as Follows:
The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.
Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.
Mill-men are invited to examine these pans and setlers for themselves, at the office, 329 Fremont Street, San Francisco.

13v24-3m

Starlight G. & S. M. Co.

Among the numerous enterprises that have taken new life within the past few months, we are assured that none desire the confidence of the public more than the "Starlight Gold and Silver Mining Co., situated in Humboldt Mining District, Humboldt county, Nevada. The Company's property consists of three mines, located in 1862, and they have lately acquired a fourth by purchase. The company was organized in March, 1863, and work commenced immediately, but in the former way of going below the mine and starting a tunnel before the mine was reached, the funds were exhausted; assessments were levied and not paid, and the property reverted to the few who located the mines, and knew their value. In February of this year, the company reorganized, and became a live company. On the first of March work was commenced on the

Starlight Mine

By sinkiug on the lode. The shaft is now down 60 feet; they have a well-defined vein four feet in width, running north and south, nearly vertical, dipping slightly into the hill; the quartz is of a pink or rose color, and interspersed with mineral. Professor Silliman examined this mine in October, 1864; he reports the following:

On its out-crop, this vein is seen cutting the quartzite iu which it is found—with a course in the main, northwest and dipping southeast about eight degrees from the vertical. It has been opened at this place by a shaft sunk in the adjacent rock, 27 ft. deep. From the bottom of this shaft a cross cut has been run east—to cut the lode—which is here found to be five feet wide, the wall rock is feldsite. The associate minerals in the lode are free gold in small particles, with iron pyrites; also galena which is auriferous and argentiferous and a little copper pyrites and zinc blende. A sample for assay and working test whioh was made up from the vein stuff collected from this location, gave the following result: Gold $47.75; silver $10.53; total, $58.29 to the ton of 2,000 lbs. A tunnel is also started, calculated to strike the vein 411 ft. below the surface, and is now in 460 ft. The rock through which the tunnel was driven, is a hard bluish quartzose feldsite carrying some blende, galena, yellow copper, and veins of calcareous spar.

The mine is situated within three miles of Humboldt station, on the Central Pacific Railroad, with a good wagou road to it; the cañon abounds in springs, a portion of the water of which is carried to the station for the use of the railroad and irrigation. All trains stop at the station, and make the distance from San Francisco in 24 hours.

The Madre Lode,

Recently purchased by the Starlight Company, lies in Florida Cañon, one mile from Humboldt station, and about the same distance from the Starlight lode. Professor Silliman who examined this lode in 1864, says: "This gigantic gold quartz lode, lying in the western slope of the main Humboldt range, is situated in the Cañon next south of Humboldt Cañon, and at an estimated hight of 600 ft. from the river. The lode runs north and south, and is at least 80 ft. wide on the croppings. These croppings are on a scale of magnitude seldom seen anywhere. The quartz is variegated in color, and shows cavities from decomposition of sulphurets. It does not show free gold to the naked eye, hut a careful examination detects minute particles. The amount of quartz available hy simply quarrying on this long extended out crop is something surprising, and is at least adcquate to the supply of a 20-stamp mill for years without deep mining.

A sample of this quartz made up by breakiug fragments promiscuously from various parts of the surface in a working test in a mill, gave to the ton of 2,000 lbs, gold, $41.37; silver, $4.18; total, $44.55. By fire assay the same sample gave $57.78. No metallic particles conld be seen in the samples selected. The lode is peculiarly situated for economical working. It is approached by a gentle grade dowu which the quartz can be taken to the mill by a natural roadway, no grading being necessary. The total cost of treatiug the rock may be stated as follows: Assuming that the quartz is quarried off the surface for which there is an abundant supply.

Breaking out and loading qnartz per ton.	$2 50
Hauling to mill	1 00
Machinery including mercury	1 00
Labor, say 3 men per day and 30 tons crushed	2 50
Total	$7 00

In view of the history of other gold-bearing out-crops in Nevada, the "Madre" may prove a silver-bearing vein in depth. In point of strength of out-crop, it is more like the Gold Hill mines than anything I have seen elsewhere in Nevada. I am able to add to these statements that I saw nothing in the Humboldt rauge, which appeared to hold out such good promise of early return for capital and labor expended as the Madre Lode. Its advantages are:

1st. Its great magnitude and consequent abundance of ore.

2d. Its accessihility and easy approach.

2d. Its comparative richness in gold, and the simplicity of the process of amalgamation, all the metals existing as free metals.

It is thorefore quite plain that if the "Madre" continues to hold its superficial promise, it can be made a rich paying mine.

Mining Accidents.

Gen. A. L. Page, superintendent of the Ingomar mine was severely bruised on the 21st ult. by being precipitated down a shaft, through the disarrangement of the hoisting gear. The brake strap was defective and gave way, letting him down at fearful speed. The lower part of his body was bruised very badly.

At the Eureka mine in Grass Valley a short time since William Rowe sustained injuries in his right eye by being struck with a picce of rock.

A miner was severely hurt in Marcellu's diggings on the 3d inst. according to the Nevada *Gazette*, by a defective blast.

The Missoula *Pioneer*, says that a miner, name unknown was killed by a cave in Deep Gulch, M. T., recently.

A man named Schroeder was killed by a cave on the 1st inst., in a claim near Folsom.

Two miners, named James Sullivan and Jeremiah Blood were killed by a cave in the Mount Diablo coal mines on the 4th inst.

THE GUADALUPE GOLD, SILVER & COPPER M. Co.—This Company filed their certificate of incorporation, March 30th, 1872, the object being to mine for the precious metals in the district Comondu, Lower California.

They have a capital stock of $2,000,000, (instead of $200,000, as has been stated in the papers of this city), divided into 20,000 shares of $100 each, and have placed 5,000 shares in the Treasury to be sold as a working capital, with the expectation of avoiding the necessity of ever levying an assessment on the stock. The mine has been opened to the depth of 115 ft. by a main shaft sunk on the course of the ledge and by two other shafts 50 and 30 ft. deep, 500 ft. apart from north to south, each shaft yielding copper of 90 per cent. Gold assayiug $60 per ton of 2,000 lbs, and silver, $58. We are assured that this is uo stock gambling institutiou, but that the company intend to proceed immediately to develop the mine. We understand that Capt. Wm. Williams, well-known as a mining superintendent on this coast, is to have full charge of the miue, the best guarantee that the mine will he worked legitimately, and in the interests of the stockholders. A. G. Wood, No. 210 Battery street, is the Secretary of the Company, to whom application can be made, for full particulars.

ORES SAMPLED.—J. W. Thurman, 413 and 415 Mission street, crushed and sampled the following lots of ores for the month of March.

294 sks. Antimony, Mill City, Nevada.
1,054 sks Copper ore, Salt Lake, U. T.
2,200 sks. Copper ore, Battle Mountain, Nevada.
142 sks. Silver ore, Prescott Dist., Arizona.
302 sks. Silver ore, Arizona Mill, Nevada.
741 sks. Lead and Silver ore, White Mine, Battle Mt.
38 sks. Silver ore. Eureka Dist., Nevada.
66 sks. Silver ore, Clark Dist., Arizona.

4,837 sks.

The above copper ore from Salt Lake was sold in this market for Bluestoue; the 2,200 from Battle Mountain, copper, was shipped to Liverpool on owners' account. All the above lots of silver ore were purchased by shippers and shipped to Liverpool. Copper ores are very scarce at this time and there is a good demand both for shipment and manufacturing into Bluestone.

New Incorporations.

The following have filed certificates with the County Clerk, San Francisco:

CORONA CONSOLIDATED M. Co.—April 4. Location: Eureka District, Nevada. Capital stock, $5,000,000, in 50,000 shares. Trustees—George D. Roberts, H. P. Coon, D. H. Hall, L. S. Adams and Henry Dutton.

AUBURN G. M. Co.—April 4. Location: Placer county, California. Capital stock, $800,000, in 8,000 shares. Trustees—Geo. D. Roberts, Henry Baker, Stephen W. Lee, T. G. Wright and J. R. Nickerson.

HOWLAND TUNNEL Co.—April 4. Location: Utah. Capital stock, $10,000,000, in 100,000 shares. Trustees—S. Hydenfeldt, Joseph Aaron, Michael Castle, J. Steinhart, and W. H. Howland.

ELIZA M. AND M. Co.—April 5. Location: California. Capital stock, $600,000. Trustees—Geo. W. Marshall, Archibald C. Peachy, Thomas J. Poulterer, Mortiz Mayblum and I. P. Couch.

YUBA GRAVEL M. Co.—April 6. Location: North Bloomfield or Virgin Valley District, Nevada county. Capital stock, $300,000, in 30,000 shares. Trustees—Thos. R. Hayes, John Skinker, C. W. Kellogg, Charles Hosmer and D. R. McKillecan.

UTAH S. M. Co.—April 8. Location: Virginia District, Nevada. Capital stock, 2,000,000, in 20,000 shares. Trustees—A. K. P. Harmon, Chauncy B. Land and John Skae.

OTHELLO S. M. Co.—April 9. Location: Ely District, Nevada. Capital stock, $2,000,000, in 20,000 shares. Trustees—George D. Roberts, J. D. Fry, M. D. Townsend, Wm. H. Sears and J. B. E. Cavallier.

JOLLY TRAVELER M. Co.—April 9. Location: Ely District, Liucoln county, Nevada. Capital stock, $3,000,000, in 30,000 shares. Trustees—J. A. Pritchard, A. P. Cox, Geo. A. Treadwell, C. H. Rumsell and C. W. Rand.

WEBFOOT M. Co.—April 9. Location: Railroad District, Elko county, Nevada. Capital stock, $1,200,000, in 12,000 shares. Trustees—A. J. Roulstone, Hiram H. Colley and A. M. Hough.

EL DORADO SOUTH CONSOLIDATED M. Co.—April 9. Location: Philadelphia M. District, Nye Co. Nevada. Capital stock, $4,000,000. Trustees—A. Hayward, W. F. Leon, J. S. Slauson, H. Epstein, J. Steinhart, W. S. McCormick and A. H. Rutherford.

DESERT CONSOLIDATED M. Co.—April 9. Location: Camp Floyd District, Tooele county, Utah. Capital stock, $3,000,000, in 30,000 shares. Trustees—E. C. Catherwood, E. B. Rail, A. J. Bryant, John Harding and Harvey S. Brown.

EMERALD G. AND S. M. Co.—April 10. Location: El Dorado county, Cal. Capital stock, $250,000, in 2,500 shares. Trustees—Richard O'Neill, H. P. Wakelee, Phillip Cadue, H. W. Seale and Chas. E. McLane.

ORIENT S. M. Co.—Filed an amended certificate of incorporation, April 10. Location: Ely Mining District. Capital stock, $2,000,000, in 20,000 shares. Trustees—S. A. Raymond, Jame A. Pritchard, James Dods, Andrew Kohler and Wm. Hazlehurst.

An amended certificate of incorporation of the Maxim Gas Company was filed, Mar. 10, which increases the capital stock from $600,000 to $1,200,000.

Elections.

At the meeting of the Arizona & Utah mining Co. held on the 8th inst., the following Trustees were elected: Jas. A. Pritchard, M. D. Townsend, W. F. Meyers, W. H. Sears and N. T. Smith; Jos. Maguire was continued as Secretary.

The Murphy Mining Co. elected the following Trustees on the 10 inst. Hill Beachy (Pres.), Thos. Bell, J. H. Boalt, J. W. Gashwiler and J. D. Hague. P. S. Buckminster was continued as Superintendent and J. L. King Secretary.

W. J. Lee, J. E. de la Montanya, Delos Lake, M. Mayblum, and C. O'Connor were elected Trustees of the South Emma mining Co. to-day.

The Hercules Silver mining Co. have elected as follows: Henry Raymond (President), W. H. Sears, C. P. Hall, Geo A. Treadwell and J. T. Milliken (Secretary).

DISCOVERIES.—Placer diggings are reported to have been struck about 13 miles from San Bernardino, in that county. Water being scarce, however, they can only be worked in winter.

A ledge of high grade smelting ore has heen discovered in the Ruhy range, north of the Buckeye aud Champion mines, in Nevada.

Quartz coutaiuing free gold is reported to have been found within a mile and a half of San Diego City.

Another quicksilver lead has been discovered 7 or 8 miles from Cloverdale, between Sulphur aud Squaw Creeks, in Napa County.

A dispatch from Los Angelos dated 10th iust. says that there is a reported discovery of tin and silver in the hills south of Cucomongo, near the Rubidoux rancho. Thirty men are now prospecting the hills. A ledge was found on Monday last. The locality bas been traditionally reported to be rich in mineral wealth.

PACIFIC SAW MANUFACTURING Co.—We have received from the Pacific Saw Manufacturing Co. and N. W. Spaulding, their new price list and circular. This circnlar gives a plain and succiut description of the saw manufacturing business on this coast. Although intended as a price list of the goods made by the company, it nevertheless contains matters of especial interest to every sawyer and millman, or those in any way connected with the business. The trade of this firm has become wide and extensive, and their enterprise and superior workmauship, we are pleased to learn, have driven foreign goods from the market. The circular contains tables for the measurement of logs up to 96 inches in diameter, which must prove valuable to millmen. The circular is illustrated with numerous cuts, showing the rooms of the factory, the process of making saws, sawteeth, saw-machinery, and it presents the neatest and best typographical appearance of any similar publication we have ever seen. It was printed by Spaulding & Barto. A large portion of the edition will be furnished for Eastern circulation through the branch establishment of the house here.

Mining Shareholders' Directory—Meetings, Assessments and Dividends.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the Scientific Press, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Francis Mining Company--Location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 6th day of April, 1872, an assessment of one dollar per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary of the company, 409 California street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 14th day of May, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 4th day of June, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale.
By order of the Board of Trustees.
T. J. CRONISE, Secretary.
Office, 409 California street, San Francisco, Cal.

Ingomar Silver Mining Company—Location of works, Ely Mining District, Lincoln County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 2d day of April, 1872, an assessment of 25 cents per share was levied upon the capital stock of said company, payable immediately, in U. S. gold coin, to the Secretary, at the office of the company, Room 21, Hayward's Building, 419 California street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on Wednesday, the 8th day of May, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Friday, the 31st day of May, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale.
By order of the Board of Trustees.
CHAS. S. NEAL, Secretary.
Office, Room 21, Hayward's Building, No. 419 California street, San Francisco, California. ap6-4t

Lyons & Wheeler Mining Company—Location of works, Maynard Mining District, Mohave County, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 6th day of April, 1872, an assessment of Ten Cents per share was levied upon the capital stock of said Company, payable immediately, in United States coin, to the Secretary, at the office of the company, Room 3, No. 419 California street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on Wednesday, the 15th day of May, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 3d day of June, 1872, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Trustees.
T. W. COLBURN, Secretary.
Office, Room 3, No. 419 California street, San Francisco, California. ap13

Mount Jefferson Milling and Mining Company—Location of works, First Garote, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 3d day of April, A. D. 1872, an assessment of Thirty Cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company. Any stock upon which said assessment shall remain unpaid on Monday, the 6th day of May, A. D. 1872, shall be deemed delinquent, and will be duly advertised for sale, at public auction, and unless payment shall be made before, will be sold on Wednesday, the 22d day of May, A. D., 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees. J.W. CLARK, Sec'y.
Office, 418 California St., San Francisco. ap13-3w.

Marcelina Silver Mining Company.—Location of Works: Eureka District, Lander County, Nevada.

Notice is hereby given that at a meeting of the Board of Trustees of said company held on the eighth day of March, 1872, an assessment of ten cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, Room 21, Haywsrd's Building, 419 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the fifteenth day of April, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the seventh day of May, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.
CHAS. E. ELLIOTT, Secretary.
Office, Room 21, Hayward's Building, 419 California street, San Francisco, California. mar19-3w

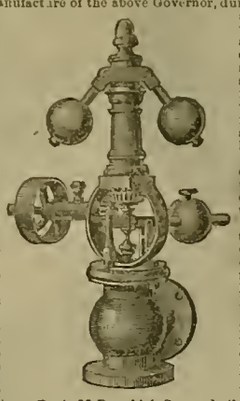
Nevada Land and Mining Company---Location; Spruce Mountain, Antelope and Clifton Mining Districts, Elko County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 28th day of March, 1872, an assessment of four cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the Co.'s office, room 5, No. 302 Montgomery street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on Thursday the 2d day of May, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Friday the 24th day of May, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.
WM. H. WATSON, Secretary.
Office—Room 5, No. 302 Montgomery st., San Francisco, California. mar30-td

THE GARDNER AUTOMATIC SAFETY-STOP GOVERNOR.

These Governors have now been sold in this market for several years, and wherever once introduced and made known, are invariably sought after. They are in the Eastern States fast displacing all other Steam Governors, and are regarded as *the perfect regulator*. They are manufactured by Messrs. Gorchur & Roberts n, practical engineers, who have given many years time exclusively to their manufacture and perfection. The manufacturers say: After an experience of eleven years in the manufac ure of the above Governor, during which time several important improvements have been made and two additional patents obtained, we feel justified in recommending it to all parties using Steam power, and warranting it to be the most perfect regulator in the market.



The Gardner Governor is so well known that we think it unnecessary to enter into a detailed explanation of the principles involved, or details in its construction, merely giving the leading objects realized by this important invention. The Gov-nor combines with the greatest simplicity of construction, accurate regulation of speed, POSITIVE INSURANCE AGAINST ALL ACCIDENTS LIABLE TO OCCUR FROM SLIPPING OR PARTING THE GOVERNOR OR DRIVING BELTS, and a convenient arrangement for ADJUSTING THE SPEED OF THE ENGINE WHILE IN MOTION, without change of pullies.

The construction of the Governor is extremely simple, having no springs, fusible joints, swivels, or parts liable to disarrangement, all the several parts are duplicates of each other in the same series; the most skillful workmen are employed, the best material used and the machinery employed especially adapted to their manufacture. The valve is most PERFECTLY BALANCED, and the Governor is built with a view of securing the quickest and most sensitive action possibly attainable in a steam regulator. Thus with accurate machinery, and skilled labor, and devoting our WHOLE ATTENTION to the manufacture of THIS ONE ARTICLE, we are able to produce a perfect and reliable Governor at a low price.

We do not publish any letters of recommendations, but can give references to upwards of 5,000 PARTIES THROUGHOUT THE UNITED STATES, who are using the Gardner Governor.

We would especially invite the attention of Steam Engine Builders to this Governor, feeling assured that they can purchase for less than they can make an inferior article, and thereby increase the value and sales of their Engines.

We respectfully refer to the following parties using the GARDNER GOVERNON, and can speak understandingly of its merits: Oakland Cotton Mills, the Selby Lead and Silver Smelting Works, L. & E. Emsnuel, Vulcan Iron Works, Fulton Foundry, Levison Bros., Cal. Jewelry Co., Pioneer Woolen Factory, D. A. McDonald & Co., and others in San Francisco; Ophir Co., Lady Bryan, and Sacramento and Meredith Mills, John McCone, Virginia, Nev.; Globe Iron Works, Stockton; A. F. Chury, Albany, Oregon, and many others.

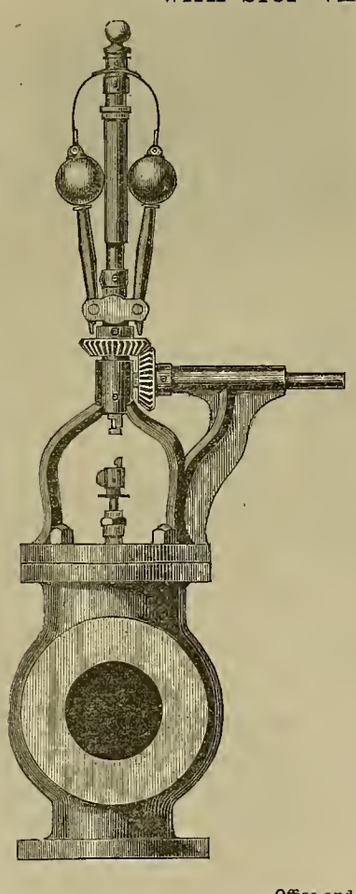
☞WE WARRANT these Governors to give perfect regulation of speed under all circumstances; and if there is one within one thousand miles of San Francisco, that is not giving perfect satisfaction, it may be returned to us at our expense, and we will exchange it for any other Governor in the country, or refund its price.

☞When ordering please state whether THROTTLE-VALVE is wanted or not; and whether BLOCK or FINISHED Governor is desired. ***THE RATE OF SPEED FOR GOVERNOR IS FULLY STAMPED ON THE REVOLVING HEAD OF EVERY GOVERNOR. Send for circular and price list to

TREADWELL & CO.,
Agents for Pacific States, San Francisco.

☞At Treadwell & Co.'s (late BERRY & PLACE'S) Machinery and Supply Depot may be found in stock the above Governors, together with all sizes of HOADLEY'S PORTABLE ENGINES, BLAKE'S STEAM PUMPS, STURTEVANT BLOWERS, PORTABLE DRILLS, TAPS AND DIES, DREYFUS'S CYLINDER LUBRICATORS, Etc. Also a heavy stock of HARDWARE AND MINING TOOLS, LEATHER BELTING, LINEN HOSE, BOILER FELT (saves 25 per cent. of fuel), SELF OILERS, LACE LEATHER, STEAM PACKING (all kinds), BELT STUDS, Etc., Etc., embracing every description of Engineers' and Machinists' supplies and Millmen's findings. 7v24-tf

HENDY'S
Improved Lamont Steam Engine Regulator,
WITH STOP VALVE ATTACHED.



PERFECTLY RELIABLE.

Rapidly Superceding all other

GOVERNORS

Wherever introdnced.

We Invite the Attention of those

Union Gold Mining Company.---Location of works, Howland Flat, Sierra county, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 11th day of April, 1872, an assessment of one dollar ($1.00) per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary, at the office of the Company, Room No. 22, Merchants' Exchange Building, California street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the 13th day of May, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 3d day of June, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees. ALFRED K. DENHOW, Secretary.
Office—Room No. 22, Merchants' Exchange Building, California street, San Francisco, California. sp13-td

Nuestra Senora de Guadelupe Silver Mining Company.—Location of Works: Tayoltits, San Dimas District, Durango, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twelfth day of May, 1869, an assessment of two dollars per share was levied upon the assessable capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, E. J. Pfeiffer, No. 210 Post street, or to the Treasurer, A. Himmelmann, No. 637 Washington street, San Francisco, to settle the indebtedness of the said Company.

And whereas there has been an error in the course of proceedings for the collection of said Assessment, by reason of which, as provided by law, all previous proceedings, except the levying of the Assessment, are void, and publication required to be begun anew, NOW, therefore, by order of the Board of Trustees of said Company, at a meeting of said Trustees, held on the eighth day of March, 1872, said Assessment is hereby re-published, and notice thereof given as follows, to wit:

Nuestra Senora de Guadelupe Silver Mining Company.—Location of Works: Tayoltits, San Dimas District, Durango, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twelfth day of May, 1869, an assessment of two dollars per share was levied upon the assessable capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, E. J. Pfeiffer, No. 210 Post street, or to the Treasurer, A. Himmelmann, No. 637 Washington street, San Francisco, to settle the indebtedness of the said Company.

Any stock upon which said assessment shall remain unpaid on the fifteenth day of April, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the eighth day of May, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.
E. J. PFEIFFER, Secretary.
Office, No. 210 Post street, San Francisco, California.

Ophir Copper, Silver and Gold M. Company—Location of Works, Ophir, Placer County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 18th day of March, 1872, an assessment of twenty (20) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, N. E. Cor. Sansome and Halleck Sts., entrance on Halleck street, San Francisco. Any stock upon which said assessment shall remain unpaid on the 20th day of April, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 17th day of May, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees. R. G. BRUSH, Secretary.
Office, N. E. Corner Sansome and Halleck Streets, S. F.

Quail Hill Mining and Water Company---

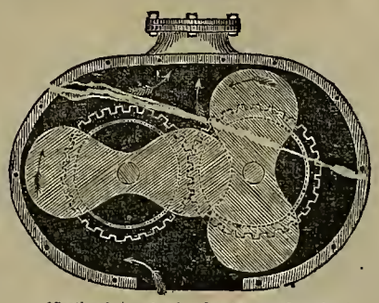
ROOT'S PATENT FORCE BLAST ROTARY BLOWER,



[Sectional view showing the pistons and gearing.]

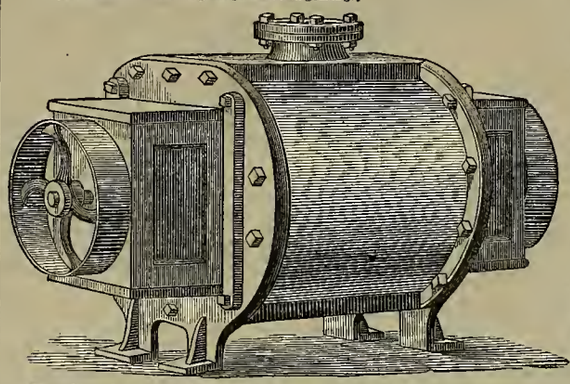
MANUFACTURED AT THE

GLOBE IRON WORKS,

Stockton, Cal.

Awarded the First Premium at the Paris Exposition.—Patented November 1, 1864; July 24, 1866; and October 9, 1866.

Adapted for Smelting, Foundry, Mining and Steamships. Requires 50 Per Cent. less power than any Blower now in use.



One of these Blowers may be seen at W. T. Garrett & Co.'s Brass Foundry, San Francisco; Gould & Curry and Savage S. M. Co.'s, Nevada; and at C. P. R. R. Co.'s Works, Sacramento; and other places on this coast.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article. Quartz, Saw and Grist Mill, Iron, Stationary and Steamboat Engines, Horse-Power and Pumps, of all Sizes.

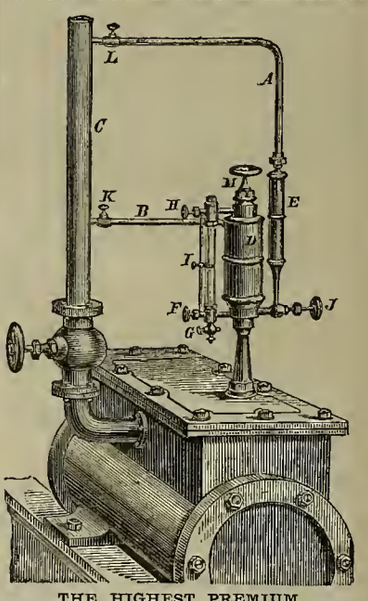
Machinery.

N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

BLAKE'S PATENT STEAM PUMP.

From the Report of the Committee on Steam Pumps, at the Seventh Indnstrial Exhibition of the Mechanics' Institute, San Francisco :

BLAKE'S STEAM PUMP.—This Pump yielded the best results as to the quantity of water discharged as compared with its measured capacity. The valves are of brass, and well arranged. The steam valves are well arranged for operating the pumps, either fast or slow.

We recommend that a Medal be awarded to it, as THE BEST STEAM PUMP. [Awarded a SILVER MEDAL, the first premium.] (Signed) JAS. SPIERS,
WM. H. BIRCH.

From the Report of the Committee on Steam Pumps, at the Eighth (or *last*) Industrial Exhibition of the Mechanics' Institnte, San Francisco :

BLAKE'S MINING PUMP.—This is an excellent Pump, well made, and gives a high per cent. of duty. We recommend a Diploma for this Pump. (Signed by the Committee.)

G. W. DICKIE, H. B. ANGEL, CHAS. R. STEIGER,
W. EPPELSHEIMER, MELLVILLE ATWOOD.

[No other Steam Pump received other than a Diploma or honorable mention at the LAST Mechanics' Exhibition, *all other assertions to the contrary notwithstanding.* Hooker's Hand Pump was the *only* Pump, of any kind whatsoever, that received a MEDAL and FIRST PREMIUM (highest award to pumps) at the *last* Exhibition, for which we are also selling agents.—*See official Report of the above Committee.*]

The trial of Steam Pumps at the Eighth Industrial Fair in San Francisco, by a committee of five of the most thoroughly practical mechanics on this coast (as above named), showed that the Blake Pump gave 86 per cent. of utilized power, while others gave but 60 per cent., showing great difference in economy.

The Blake Pump is the ONLY *Steam Pump that* EVER RECEIVED A SILVER MEDAL *at any Exhibition of the Mechanics' Institute ever held in San Francisco or California.*

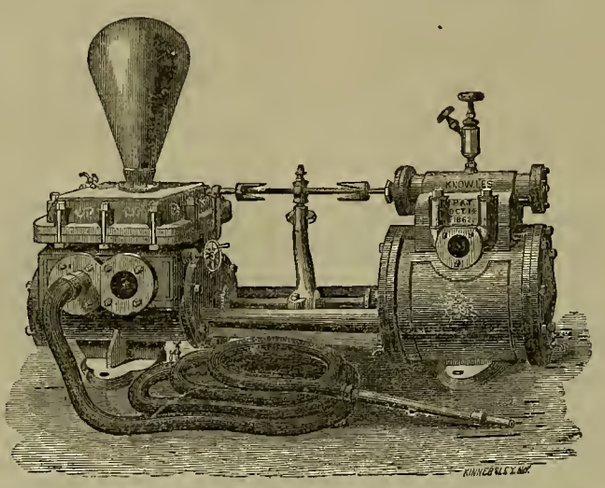
☞ A complete stock of all sizes constantly on hand at the Machinery Warehouse of the Agents,

TREADWELL & CO.,
12v3-awbp Market street, corner of Fremont, SAN FRANCISCO.

KNOWLES' PATENT STEAM PUMP.

Received the Highest Award---A Diploma---

Over all Steam Pump Competitors, at Mechanics' Institute Fair of San Francisco, 1871; also Special Medal and Diploma at State Fair.



It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.

The trial of Steam Pumps at the Eighth Industrial Fair in San Francisco, by a Committee of Five of the most thoroughly practical mechanics on this coast, showed the Knowles Pump to lose but 11⅓ per cent., while others lost as high as 40 per cent., showing great difference in economy.

CENTRAL PACIFIC R. R., OFFICE OF THE GEN'L MASTER MECHANIC,
SACRAMENTO, Cal., April 14, 1871.

A. L. FISH, Esq., Agent of the Knowles' Steam Pump, San Francisco—Dear sir: In reply to your inquiry as to the merits of the Knowles' Steam Pump, in use upon this road, I will say that we have nineteen of them in use on this road as fire engines, and pumping water for shop and station use. I consider the Knowles Steam Pump the best in use, and prefer it to any other. Yours truly, A. J. STEVENS, General Master Mechanic.

WE BUILD AND HAVE CONSTANTLY ON HAND

THE LARGEST STOCK OF PUMPS IN THE WORLD,

And for Every Conceivable Purpose.

A. L. FISH, Agent.

No 9 First Street, San Francisco, Cal.

The Scientific Press is the Oldest and Largest Practical Mining Journal in America.

Established in 1860, this weekly has steadily advanced in size, ability and interest. Its chief editors and publishers have had over fifteen years successful experience in conducting this and other journals in California.

Its editorials are carefully prepared with an honesty and accuracy that maintains its reputation as the best authority on mining matters in the country.

It is published in the best location in the world for furnishing the largest amount of valuable information to the gold and silver miners and metallurgists everywhere.

Its correspondents and subscribers are to be found in nearly all the mining districts of CALIFORNIA, NEVADA, IDAHO, MONTANA, UTAH, ARIZONA, COLORADO, and in MEXICO and other foreign countries.

Over 10,000,000 Dollars!

Have doubtless been saved to the miners of the Pacific Coast by reading this journal, each issue of which contains some two pages of MINING SUMMARY from the most important districts in the U. S.; from one to two pages concerning NEW INCORPORATIONS, SHARE MARKET, MINING CORRESPONDENCE, COMMUNICATIONS, etc., and from two to three pages of EDITORIALS (with illustrations) of NEW MACHINERY, NEW DISCOVERIES, PROCESSES, and operations in MINING, MILLING, ROASTING of ORES, ASSAYING, etc.

One feature of our journal consists in presenting in each issue a POPULAR VARIETY of highly interesting matter, useful and instructive for all intelligent readers, systematically arranged in departments under headings entitled Mechanical Progress; Scientific Progress; Mechanical Hints; Home Industry; New Discoveries; Good Health; Domestic Economy, etc., rendering its reading pleasant and profitable at the OFFICE, SHOP AND FIRESIDE.

Yearly subscription $4 per annum. Single copies 10 cents. Four sample copies (of recent dates) furnished for 25 cents. List of California mining hooks sent free. DEWEY & CO., Publishers, Patent Agents and Engravers, No. 338 Montgomery street, San Francisco.

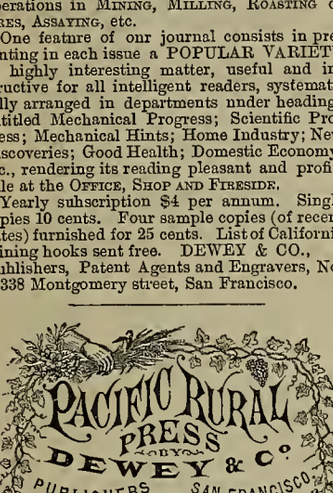
PATENT AGENCY.



The principal Agency on this side of the continent. Established in 1860. Inventors can rely upon the surety and dispatch of all important and confidential business intrusted in our hands. Long familiarity with Mining, Farming, and all other classes of inventions on this coast, enables us to give the most intelligent advice to PACIFIC COAST INVENTORS of any Agency in the Union, and oftentimes save unnecessary delay and expense. Every branch of the patent soliciting business attended to. All WORTHY INVENTIONS patented by us will be liberally noticed, free, at the most desirable time for the patentee, in both the SCIENTIFIC PRESS and the PACIFIC RURAL PRESS.

Send for our 52-page illustrated PATENT CIRCULAR, mailed free on receipt of stamp. Also the U. S. Patent Law of 1870.

DEWEY & CO.,

No. 338 Montgomery st., S. E. cor. California st., diagonally across from Wells, Fargo & Co., S. F.

THE GIANT POWDER COMPANY

Are now menufacturing besides the famous regular

GIANT POWDER, A NO. 2 GIANT POWDER,

Somewhat slower in its Explosion, which we recommend for

BANK BLASTING, COAL MINES,

AND FOR ALL SUCH WORK WHERE THE ROCK IS NOT VERY HARD

It is fully as safe as the other and evolves neither smoke nor noxious fumes when exploded.

Price. 50 Cents per Pound.

The sales of both grades increase very fast, which is the best proof of their superiority over other explosives.

A NEW BOOK.

The Explorers', Miners' and Metallurgists' Companion.

Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy.

Containing 840 Pages and 81 Engravings.

BY J. S. PHILLIPS, M. E.,

Of San Francisco, a Practical Operator for Thirty-four Years; Explorer, and Resident in the Pacific States and Territories for the past Six Years.

PRICE, bound in cloth, $10 (in coin or its equivalent). In leather, $12. Postage, 50 cents extra. Address all orders (wholesale or retail) to

DEWEY & CO.,

Scientific Press, 338 Montgomery street, San Francisco.

Opinions of the Press.

PRACTICAL MINING LITERATURE.—The want of sound scientific knowledge has been much felt by the miners employed in developing the vast mineral resources of the western regions of the United States, and for this want the work of Mr. J. S. Phillips, M. E., of San Francisco, will prove an excellent remedy. The book is written expressly for the miners in the districts mentioned. * * * Metallurgy, which is treated of in the concluding section, is dealt with in the same practical manner as the other subjects, the book altogether being one exactly calculated to suit the views and meet the requirements of those for whom it has been written. It is not intended as a scientific work, but to facilitate practical operations upon scientific principles. This object the book is well calculated to obtain, and its value is much enhanced by the principle which Mr. Phillips has adopted of including only those processes which can easily be carried out by practicel men unused to the delicate manipulations necessary in the laboratory of the practised chemist. The work will undoubtedly obtain a large number of readers.

Mr. J. S. Phillips is well known to the readers of the Mining Journel as having also had considerable experience in mining in Cornwall.—[London Mining Journal.

THE most practical and comprehensive work on mining subjects extant.—[Scientific Press.

A VALUABLE WORK.— * * We know of no work on these subjects in the English language at once so comprehensive, practical and intelligible.—[S.F. Golden Era.

BESIDES so many new facts and the large amount of useful knowledge derived through these official sources (Geological Surveys), the mining public are likely to find in the recently published work of J. S. Phillips, a valuable teacher and assistant. This book, which treats in an intelligent and practical way on almost every topic connected with mining pursuits, should be in the hands of every millman, metallurgist, prospector and miner on the Pacific Coast. Even the capitalist, and, in fact, every person already engaged in, or likely to become interested in the business of mining, will find in this comprehensive work an amount of information that they cannot afford to dispense with.—[S. F. Commercial Herald.

* * He has rendered to the leading industry of the Coast a valuable service—has furnished the millman and miner a safe and much needed practical guide—having earned for himself, all things considered, the credit of producing one of the most useful works ever issued from the press of San Francisco.—[Overland Monthly.

A PROSPECTOR'S MANUAL.— * * * Each branch is treated with clear style and full information. There are no words without ideas, and no ideas without practical value. Prospectors may imagine that they do not need to study books like this; but we tell them that those who prefer to remain ignorant will, in the course of a few years, be superceded by others who will learn a few fundamental principles. The book is free from trash, and solid throughout; all its matter is intelligible to men of ordinary education, and all of it is valuable to miners.—S. F. Daily Alta, Dec. 24th.

PRACTICAL MINING AND METALLURGY.— * * In the several sections the work is eminently practical. * * The work is very comprehensive, and contains a great deal of useful information which cannot be obtained from the previous books that have been written on these subjects.—[S. F. Daily Examiner.

* * It appears to be an excellent work, and must prove of great use.—[S. F. Daily Call.

* * Besides that, there is much actual knowledge to be gained from a perusal of this volume, and in this respect alone it will be a valuable assistant to those engaged actively in mining.[—S. F. Chronicle.

* * It is a plain, but comprehensive digest of mining matters generally. It affords a vast quantity of information as to the appearance and value of different ores.—[S. F. News Letter.

ACTIVE MEN!

WITH EXPERIENCE IN CANVASSING business, can now obtain lucrative and permanent employment by DEWEY & CO., Patent Agents and Publishers of the SCIENTIFIC PRESS and the PACIFIC RURAL PRESS, No. 338 Montgomery street, S. F.

Progress in the Telegraphic Art.

Telegraphing Both Ways, Simultaneously, on a Single Wire.

Some considerable interest has been attracted during the past few weeks, to the new improvement in telegraphing recently introduced upon this coast by the Western Union Telegraph Co., which consists in the feat of sending messages, in opposite directions, simultaneously, upon a single wire! The attempt has frequently been made to perform a simular feat with railroad traine upon a single track, but hitherto without success; but in telegraphy the thing is now actually accomplished, as may be seen every day at the Western Union Telegraph office, on California street.

When the electric telegraph was first brought into practical operation by the late Prof. Morse, it required two wires to completo the circuit and convey a signal from one point to another. Subsequently, however, it was discovered that by carrying a wire down into the earth at each end of the line, one wire could be dispensed with—the earth and two ground wires taking the place of the return wire. This was considered at the time the *ne plus ultra* of telegraphing. But science knows no limit to progress, and scarce ten years had passed ere the single line gave promise of becoming double, by an ingenous device—the germ of the double transmission system above referred to. For several years after the first inception of this invention by Frischer, of the then Kingdom of Hanover, improvements were made from time to time until Mr. Joseph Stearns of Boston, Mass., finally produced the device herewith shown, by which the system has now become one of great practical value.

How it is Done.

In the ordinary manner of transmitting signals from one station to another, as from K to K', as shown in the accompanying illustration, when the key at K is depressed and contact made at a with the *positive* pole of the battery, E, a signal is made to pass on through b 1, and the relay M to 3, over the line A B, through 7 and the relay M' to 5, to b' and the *negative* pole, a', of the battery, E'. The ground wires c G and c' G' being adjusted to take the place of the return wire, which was employed, as above said, on the earliest telegraphs. On a main wire, so adjusted, a signal could be sent only one way at the same time. The modification of the device by which it is made possible to transmit signals both ways at the same time is as follows:—

In the ordinary device the relays M and M' were wound with *single* wires in *one* direction; but in the double transmission system, which we will now describe, they are wound with *two* wires in *opposite* directions. The second wire passes from 1 through 2 around relay M to 4, thence through a "resistance coil," X, to the ground wire, c G.

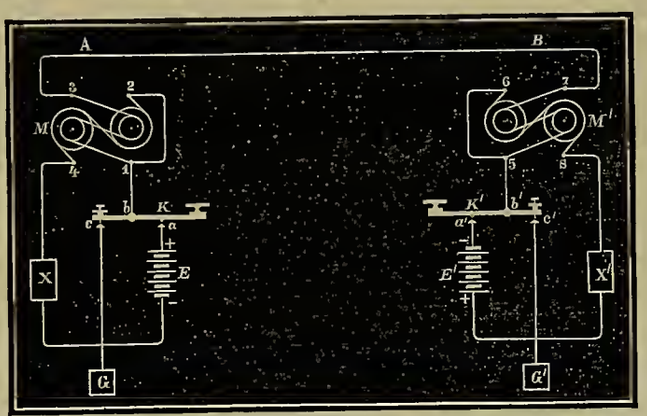
A similar arrangement is connected with the opposite station at B, as shown, where, however, the positive pole of the battery is connected with the ground.

The result of this arrangement is that when a current is sent from the battery, E, it is divided at 1, one-half passing through the relay, M, by the wire wound, say from left to right, and *via* 1 and 3 to the main line of wire, A, and station at B; while the other half passes through the relay by the wire wound from right to left and *via* 2 and 4 through X to the ground wire c, G. The same connection and division of currents will be noticed by the corresponding lettering of the station at B—the half current passing thence to the station at A.

It is by this *division* of the electric current—one-half going to the ground and the other over the wire—that it is found possible to send messages both ways at the same time, without any interference of the one with the other.

It must not be understood, however, that any portion of the signals are conveyed by the *ground current*, as some of our Eastern scientific cotemporaries have stated. All the signals pass and repass over the one main wire. The philosophy of the thing is well understood by such electricians as have made the subject a matter of study; but it is rather too abstruse to be clearly defined to the ordinary reader.

In the practical working of the system two instruments are placed upon a table, at each end of the line, one of which receives, while the other simultaneously sends messages—a low partition being placed across the centre of the table, between the receiver and sender, to



DEVICE FOR TELEGRAPHING BOTH WAYS, SIMULTANEOUSLY, ON A SINGLE WIRE.

prevent the sound of the instruments from interfering with each other.

Only one condition is requisite to the perfect working of the system, and that is that the current must be equally divided at 1 and 5. This result is secured by an ingenious adjustable arrangement at the two points of resistance, X and X'. It would be difficulty to explain this principle, or the adjustable nature of this resistance, or "rheostat" as it is technically called; but the devise is perfectly familiar to every electrician. If a wire, say 100 miles in length between two stations, is in perfect working order, the "rheostat" (X) must be equivalent in its resistance to the resistance encountered by a perfectly insulated wire of that length. But if by reason of unfavorable weather, or imperfect insulation, a greater resistance is encountered on the main wire, making it equivalent to say 150 miles in length, the extra 50 miles can be instantly applied to X, and the balance be thus kept constant and equal.

There are some unimportant details connected with this system, which present greater or less difficulties, and which to that extent interfere with the perfect working thereof; but there is reason to believe that research and experience will eventually remove all obstacles to perfect success, in which event the *working capacity of every telegraph line will be doubled*—a result the value of which can scarcely be estimated in dollars and cents. The Western Union Telegraph Company have recently acquired the exclusive ownership for the United States of the patents secured by Mr. Stearns, for his duplex instruments, which cover the most valuable and practicable devices for utilizing this latest marvel in telegraphic progress.

The duplex instruments have been in practical service for some time in New York, and their operation here is said to be so satisfactory that the company proposes to introduce them into all their offices on this coast, where the press of business may require them. The first experiments made in this city with this system were conducted by Mr. S. D. Field, the well known electrician of the Western Union Company of this city.

HONORS TO PROFESSOR MORSE.—Not content with showering honors upon the head of the illustrious discoverer of the telegraph, when alive, the whole world has combined in passing resolutions in respect to his memory. An immense audience assembled in the hall of the House of Representatives in Washington on the 16th inst., to attend the memorial services in his honor. The hall was filled with the Executive and Legislative dignitaries including the President and Cabinet, Supreme Judges, Senators, Representatives and Territorial and Municipal authorities of the District of Columbia. In the diplomatic gallery were the representatives of every foreign country accredited to the government.

Telegraphic instruments in the room were incessantly in motion with messages from every part of the globe. Speeches were made and messages read by Cyrus W. Field, from the Anglo-American Telegraph Co., of London; from the Submarine Telegraph Association; from the Telegraph Association of Egypt; and from the telegraph companies of Japan, China and Australia, all of the same date and all unanimous in sentiments of condolence to the United States for the loss sustained to science and the world at large, in the death of Professor Morse. Dispatches were read from the Chambers of Commerce of Hongkong, Singapore and Bombay, and the principal cities of the United States, through their municipal authorities, also sent suitable dispatches, San Francisco among the number.

ORDER and system render all things easy.

Gold on the Northern Coast.

The sands of the sea beach for some distance along the upper part of this coast and the coast of Oregon, contain a small proportion of gold, and have been worked with some profit for a number of years. Little is heard from these mines, and the following information concerning them from Mr. A. Bronson of Randolph, Coos Co., Oregon, will be found of interest: This coast from Coos Bay south for 200 miles or more, may be termed the gold coast of the United States. It has been laid off in districts, and claims located and worked under local mining regulations. The flood tides bring up the auriferous black sand, which, when sufficiently rich, is gathered and removed when the tide is out, and washed at leisure.

Gold has also recently been found back from the coast, at various distances, and at several localities. From two to twelve miles north of the Coquille, and from one to two miles from the present beach, and 180 feet by measurement above tide water, is an auriferous deposit of black sand extending for several miles in length, which carries from $2.50 to $40 per ton, the latter figure said to have been attained by experimental working in this city.

This deposit is known as the Pioneer lead, and is ascertained to be from 300 to 500 feet broad and 10 to 12 feet thick on its western or sea margin. It gathers to an edge on its upper or northers side, contains logs of lignite and often tasteless gum resin. It is covered with from 40 to 60 feet of drift sand, much of which is like soft rock, and this again is covered with a heavy forest, many trees being from 4 to 6 feet in diameter, and 50 to 200 feet high. This timber is heavier further back and lighter as you reach the sea, with unmistakable evidence that similar forests have preceded the present.

The more elevated deposits of auriferous sands were evidently thrown up by the waves of early geological ages, since which time the coast there, as throughout the entire western coast of the continent, has been gradually elevated, until the sea has been driven back in some places many miles from its former shore line.

A SIGNAL SERVICE STATION IN ALASKA. Chas. P. Fish, of the Signal Service, has been sent on to establish a station at St. Panls' Island in Alaska. He is to take observations on the tides, phenomena of storms, temperature of the sea, icebergs in Behring Straits, etc. He is also to obtain information concerning ice obstructions in Behring Straits, auroral displays, electric discharges and proportion of foggy and clear weather. He will endeavor to ascertain the precise direction of the great current of the northern Pacific, which runs along the coast. The results of these observations will no doubt be of great interest not only in a scientific point of view, but also as they effect the general questions of commerce, climate, etc.

CORRESPONDENCE.

Notes of Travel in Placer County—Continued.

[By our Traveling Correspondent.]

Colfax.

This beautifully located village, which was named in honor of our Vice-President, contains about 500 inhabitants, and is situated on the line of the C. P. R. R., distant from San Francisco by rail, 192 miles, and 18 miles a little north of east of Auburn, the county seat of Placer county. Its elevation is 2,421 feet. The town is accommodated with a large number of merchants, but have no manufactures of any importance. It contains three hotels, the principal of which are the Exchange Hotel, A. D. Bullard, proprietor; and the Pioneer House, R. T. Bowley & Co., proprietors. This is the point on the railroad where passengers take stage for Grass Valley and Nevada City, the latter of which is 12 miles distant in a westerly direction. The Telegraph Stage Co. which runs between these two points and extends its route as far to the westard as San Juan North, is owned by Messrs Hamilton & Gordon. They use 4 and 6-horse coaches, and make daily trips.

The Rising Sun Quartz Mine,

Located about one mile southwest of Colfax, is incorporated with a capital of $800,000 in 3,000 shares. The length of the claim is 3,000 fest, running nearly east and west; W. B. Hayford is President, and W. A. Hines, Secretary—office in this place (Colfax). They have a fine set of hoisting works run by a 25-horse power steam engine; also a 5-stamp mill run by an engine of 40-horse power, which has a capacity of crushing 12 tons per day of 12 hours, and which has at present as much as it can do. The main shaft on the ledge is down 365 feet, nearly perpendicular. The vein in the bottom of the shaft varies from one to two feet in thickness; the pay running from $20 to $50 per ton, and averaging about $35 per ton. The gold taken from this rock is of unusual fineness, running from 900 to 932 fine; 30 men are regularly employed.

Montana Quartz Mine.

This is an incorporation with a capital of $30,000 in 24,000 shares, the stock of which is principally held here. R. T. Bowley is President and W. B. Storey Secretary. The mine is ¾ of a mile west of Colfax and in sight of the "Rising Sun." The company claim 2,500 feet on the ledge which runs on a parallel with the above-mentioned mine. Their improvements consist of steam hoisting-works, run by an engine of 40-horse power, and a 10-stamp mill which has just been erected, all complete except adding the stamps, which, by the time this is in type, will be in and the mill in operation. Their main shaft is down 140 feet and contractors now sinking will complete the distance to the 170-ft. level. This ledge is a very wide one, so much so that with a 12-ft. shaft the hanging wall has not been found. The rock carries considerable sulphurets and has paid an average of $6 per ton in free gold. The sulphurets, of which the rock contains about 50 per cent., it is presumed will pay well. They are at present using Giant powder for blasting, having lately given up the use of black powder, and are well satisfied with the change, progressing nearly 50 per cent. faster.

Auburn,

The county seat of this county, is located one mile to the northward of Auburn station and distant from your city by rail 174 miles; its elevation is 1,363 feet, and it contains between 800 and 1,000 inhabitants. There is one good hotel, the American Exchange, presided over by G. H. Stephens. In a business way the town is quite dull. There are two excellent weekly papers published here—the *Stars and Stripes* and *Placer Herald*. The principal dealer in groceries, hardware, etc., is Robert Gordon, who is also the agent of the Giant Powder Company. While the quartz interest surrounding the town is quite considerable, the auriferous gravel deposits are also worked, and farming and horticultural pursuits are followed by many. Taking the mines in rotation, passing to the westward, the first is the

Greene Mine,

Distant from Auburn 2½ miles. The mine is incorporated with $600,000 capital in 10,000 shares, the stock of which is principally owned here. A. C. Peachy is President, and C. M. Greene Secretary, both of your city. Principal office of the company 413 California street, San Francisco. Wm. G. Greene, is Supt. This mine has a length of 1,132 feet, the ledge running east and west and dipping to the southward. The walls both carry a large amount of base metal containing some free gold, silver, copper and arsenic. Their improvements consist of fine hoisting-works run by a 30-horse power engine; the pumps (Cornish) are run by a 40-horse power engine. The company also own a 4-stamp mill, which is run by water-power, and which is used principally for reducing specimen ore. The mill contains two Hepburn pans. The company will soon erect a 15-stamp mill on the premises. Their main shaft is down 220 feet, at an incline of 15 degrees. The ledge at this point is a little over two feet thick and from the top down averages 30 inches. They are still sinking on the mine and have not stoped any as yet, nor will they until they get down 250 feet. Blasting agent used is Giant powder, giving general satisfaction. Employing regularly 14 men, working 8-hour shifts, night and day. The rock of this mine thus far has averaged over $100 per ton. At this writing they are taking out rock that assays over $200 per ton. Since writing the above rock has been struck in the mine, in the process of sinking the shaft, that is fabulously rich and which runs up into the hundreds per ton. This mine has never levied an assessment, and one of the few that has paid its way from the croppings down.

Peter Walter Mining Co.,

An incorporation of $800,000 capital in 8,000 shares, is located about 3 miles west of Auburn. This company claim a ledge of 900 feet in length, which runs east and west and dips to the south. Their improvements consist of steam hoisting works which are run by an engine of 25-horse power. The main shaft is down 125 feet, at an angle of 40°, at this point the ledge is about 15 inches wide. They are still sinking, and drifting at the depth of 116 feet where a level has been run 70 feet to the eastward, from which they are taking out about five tons per week. Working regularly 14 men in all departments. When they stop sinking and all its men are drifting they will take out about 18 tons per week. Two tons of this rock has been tested and pays $33 per ton. The company has really just got into working order. The rock contains a good deal of sulphurets and looks well. Their west level is in 50 feet. Gen. D. D. Colton of your city is President, and T. J. Owens, Secretary; principal office room No. 1, N. E. corner of California and Montgomery streets, San Francisco.

Bellevue G. M. Co.

This company own 8 different ledges. It is an incorporation of $800,000 capital in 8,000 shares; the stock of which is principally held in San Francisco. The location is 4 miles west of Auburn and 3 miles north of Newcastle. W. P. C. Stebbins is President, and T. F. Cronise, Secretary; principal office 409 California St., in your city. These ledges (8 in number) are 2,500 feet each in length and average in width 15 inches each. The most of the ledges have been worked for from 30 to 50 feet in depth and 2,200 feet in length. The improvements are, good hoisting-works run by water-power, the water being taken from the Bear River ditch. Their main shaft is down 150 feet and they are now running in on the 136-ft. level, which they have pierced 340 feet. These ledges, which lay parallel with each other run nearly east and west, and dip to the south; are in slate formation. The number of men engaged in all departments is about 20; taking out, on an average, about 40 tons of rock per week, which they crush at the St. Patrick Co.'s 15-stamp mill, located within ½ a mile of this mine. The rock costs 75 cents per ton for hauling and $5 per ton to crush; it pays regularly about $40 per ton. The specimen ore for which this mine is somewhat noted, however, will run into the thousands. One lot of 60 tons taken out some time ago, netted $50 per ton. The mine has been charged with "salting" its rock, but the experience of your correspondent is, on visiting the same, that it furnishes its own salt. The company is engaged at present in running a tunnel on one of the ledges parallel to the one on which the hoisting-works are situated, from Doty's Ravine on the west end, following the ledge right in. At present writing the tunnel is in 237 feet. The ledge at this point is small but widening out, and they are taking out some of as fine specimen ore as I ever looked at. Blasting agent used is Giant No. 2 and Hercules powder. Mr. Fred Jones is Superintendent, and I think this company owes its present position to the energy and successful experience of this gentleman.

St. Patrick M. & M. Co.

The mill and mine belonging to this company is located 3 miles west of Auburn and 2½ north of Newcastle. It is an incorporation with $500,000 capital in 5,000 shares. Gen. D. D. Colton is President, T. F. Cronise, Secretary; D. T. Davis, Superintendent and I. Thomas, Foreman. Principal office 409 California St., S. F. This company own 14 ledges, varying in length from 1,200 to 2,000 feet each, working only two of them. Their main shaft on one of these ledges is down 300 feet, over which hoisting-works are erected, run by a donkey engine of 8-horse power. The others are worked by windlass. Number of men engaged in the mine is 16, at present drifting and not taking out much rock. They also have a 15-stamp mill run by a 40-horse power engine. It has a capacity of crushing 24 tons per day of 24 hours; working regularly 9 men. The company are also running a tunnel 300 fsst long on one of their ledges, which is nearly completed. The tunnel is 5½ feet high and 4 feet wide; using both Giant and black powder for blasting.

St. Lawrence Quartz Mine.

This mine is located ¼ of a mile south of the St. Patrick, and near Ophir. It is owned by Bogart & Co. of your city; H. B. Purdy is Supt. The company claim a ledge of 1,200 feet in length. Their improvements consist of a 6-stamp mill, run by free water, which has a capacity of 12 tons per day of 24 hours. They have sunk two incline shafts upon this mine, at an angle of 30°, to the depth of 50 feet each. The ledge at that point is about 2 feet wide, and by working 7 men they take out 3 tons per day, 60 tons of which just milled paid an average of $22.30 per ton; rock believed to be worth 4 or 5 times that value is now being extracted. A tunnel has just been started in upon this mine, which will be when completed, 80 feet in length; at present writing is in 45 feet.

Julian Gold M. Co.

This company have a capital stock of $1,000,000 in 10,000 shares. The mine of the company is located near Newcastle on the C. P. R. R. They claim 2,500 feet on the ledge, which runs north and south and dips to the eastward. The ledge is from 3 to 8 feet thick; several shafts have been sunk upon this mine from 150 to 230 feet deep. This company have one of the largest ledges in this section of country, but up to the present time has not proved to be anything but low grade ore. The rock will average about $8 per ton, and as it costs $6 per ton to mill and mine the same, its owners can and do make a profit of $2 per ton.

L. P. Mc.

GRAPE-GROWING IN A ROOM.—Last year, a member of the Stuttgart Flower Club was successful in raising grapes in his sitting room. He takes a cutting, 3 or 4 feet long, with two fruit buds at its upper end, wraps it in moss, leaving the two buds exposed, and coils it in a flower pot which is then filled with rich loam. The plant is watered with lukewarm, never with cold, water, and a little dung may be added, but not much. The flower pot is placed in a sunny position. When the grapes are formed the shoot is pruned above the bunch, leaving however two leaves to maintain the circulation of sap.

THE WOLLASTON MEDAL.—The geological society of London at a recent meeting awarded the Wollaston medal for the present year to Prof. James D. Dana, of Yale College. This medal was founded by Wollaston himself in 1828, and is given as a mark of honor for distinguished learning and ability in the departments of geology and mineralogy.

A MACHINE for washing floors has been invented by Mr. A. Irion. It appears to be essentially a sweeping machine of ordinary construction, provided with an apparatus which causes the brush to sprinkle water, or soap suds, on the floor.

Mining Matters in Utah.

A correspondent of the *Alta*, writing from Little Cottonwood, U. T., says: The confidence of San Francisco capitalists in the mines of this Territory is steadily increasing, and notwithstanding the Monitor and Magnet and one or two other fiascos, I know personally that San Francisco operators in the mines here have in the aggregate of their investments made a large amount of money. The proportion of their losses to profits is less than in any other mining region on the coast, and as a natural result they have commenced active mining operations on several claims in this district, stocking their mines in San Francisco. Among these companies incorporated in California, and who are now vigorously developing their properties, are the

South Emma and the Wellington.

The mine of the South Emma Company lies in the line and on the level of the Emma lode, near the Emma mine, and in the same relation to it by locality as the Gould & Curry mine is to the Hale & Norcross on the Comstock. The mine is opened by an incline dipping at an angle of about 40° for a depth of 100 feet, from which a horizontal drift runs into the hill in the direction of the lode for sixty fest further, following continually improving indications and approaching the exact line and level of the Emma. This drift is being run day and night, with three shifts of hands, and in the extreme face of it, within a few days, the character of the rock is exactly similar to that which causes the solid ore lodes of all of the great mines of the belt, showing in mass a small amount of lead and silver, with occasional rich fragments of ore imbedded in the body of the rock. The farthest point of the drift is about 150 feet perpendicular below the surface, and the present level will be continued until a body of ore is struck, when longitudinal drifts will be run. It has been found necessary, because of the collection of water in the incline from the infiltration of the melting snow upon the surface, to employ an extra force of hands—a necessity that will disappear with the disappearance of the snow, as all the mines on the lower levels are perfectly dry except from the cause stated. The title to the mine is, I understand, perfect, and the prospect of its becoming very valuable, I consider, for the reasons stated, as certainly assured as anything in the nature of mining operations can be.

The Wellington mine is opened by an incline of 180 feet in depth, with five levels run on its length. Of these levels, two of them are on large and rich ore lodes as far as run, the one at the bottom of the incline being on a lode of solid ore from two to fifteen feet in width, and of an average value of $150 per ton. The smelting furnaces of the Company have suspended operations for a few days, but only on account of the bad condition of the roads, and the utter impossibility of obtaining fuel except at an enormous cost.

The Question of Fuel.

Has been the most serious hindrance to the rapid development of the mines. The immense quantity of smelting ore here would have soon exhausted in its reduction all of the charcoal available, except at a price for the article that would have embargoed the reduction of low and middling grade ores. It was assumed upon very imperfect experiment that the Rocky Mountain coal would not coke. Mr. Stowe, a San Franciscan, who has a lease of the Hinton mine at Evanston, a few weeks ago employed some cokers and essayed the experiment of converting coal to coke upon a large scale with almost perfect success. This success settles the question of fuel. Coke can be furnished at the mines in any quantity and at a price that will reduce the fuel cost of smelting one-half, and this makes available mines that else could not have been worked, and greatly increase the profits of those that yield ore rich enough to be worked at a profit, even under the present expensive system of smelting.

A number of important sales of mines in Camp Floyd District have taken place within the past week. The purchasers are Chicagoese, and are probably trying to play even on the big fire—may these ventures restore their financial equilibrium.

AS AN EXAMPLE of what the farmer would suffer without the aid of his friends, the birds, whom he too often regards as his enemies, it may be mentioned that the descendants of the fifth generation of our plant louse would, if it were not for their enemies, number 60,000 millions. But for the birds, there would be in a short time a complete destruction of vegetation.

MECHANICAL PROGRESS.

Utilization of Tin-plate Clippings (Tinners' Waste).

Tin-plate consists of iron covered with puro tin, or an alloy of tin and lead. The iron is of very superior quality. Tho test to which it is submitted is that it must bear bending at a sharp angle without cracking, and when hent under the hammer light must not shino through any crevices along tho line of flexion. The proportion of tin in tin-plate varies according to quality from 3 to 7 per cent. The valuo of tin in tho waste is about eqnal to that of the iron. Several methods for treating tinners' wasto have already heen dovised. In 1848, Schunk proposed three processes, of which the firet was to boil the clippings in sulphide of sodium, tho second to boil in soda-lye, in which litharge was suspended, and tho third to heat in a lye of chromato of potash and caustic-potash. In 1854, Jas. Higgin patented a mixture of hydrochloric acid, and solution of nitre, hy which means it was expected that the tin would bo dissolved with less action npon the iron than in hydrochloric acid alone. In 1857, Parkes proposed to put tho clippings into mercury in a revolving sheet-iron drum, and thus collect the tin in an amalgam. In 1863, Paterson patented a process for mixing the clippings with fused lead so as to form solder. By heating the mass again, the alloy is fused off. Standevant and Harman proposed to melt off the tin in a current of steam and hot air into an iron cylinder below; but all these methods seemed to present some radical objection.

A perfect method for treating tin cuttings should fulfil four conditions. 1. The iron must bo free from tin. 2. The tin must be obtained in a marketahle form, and preferably in the metallic state. 3. Large quantities must be capable of treatment at once without much labor. 4. Tho process must be cheap. Iron containing 0-5 per cent. of tin, thongh it can be forged and welded is very cold-short. It has a fine-grained steel texture, a clear ring and great hardness, but can be useful for very few purposes. None of the old processes, except that of Higgin, thoroughly remove the iron. Schnnk obtains the tin in an nnsaleable form, and his process can be used on a small scale only. Mr. Ott has recently devised a method which has been applied to 300 tons of clippings in three months. The tin waste is put into a drum of thick copper, provided with holes ⅜-inch in diameter, and two inches apart. It contains 1,000 lbs. of clippings. It is then made to revolve in a bath of acid in which the tin is dissolved off. Then the drum is lifted out by a crane, and made to revolve in a water-tank, then in an alkaline bath and then in water again. In the acid bath it revolves according to the amount of free acid, from 5 to 50 minutes, and in the others 5 minutes each, making with the time spent in lifting the drum a total of 70 minntes. So, as the drum contains 1,000 lbs. of clipping, it is possible in a day of 10 hours to treat 90 cwt.

In the acid, the tin, the lead, and ahout 5 per cent. of iron are taken up. This solution is let off into suitable tanks. The lead is separated first, and then the tin is obtained in a state of pnrity, by putting in plates of zinc, when it is thrown down either in a crystalline or a spongy form. It is well washed, fused and sold as block tin. The zinc remains in solution, one part of zinc being required to precipitate two of tin. The mixed solution of zinc and iron may be used for preserving wood, or for making coarse colors for house-painting. The iron plates are sold to the iron works.

Dorn proposes to pilo up tin clippings in chambers of a suitable material, and to dissolve off the tin by means of a gaseous mixture. On this process, it may be remarked, that though the bichloride of tin is extensively used by color-makers, dycra and calico-printers, it is necessary that it should be perfectly free from iron.

The Production of Bright or Lustrous Colors on Metals.

The active chemist, C. Puscher, of Nuremburg, proposes a new method of coloring metals which can be executed quickly and cheaply. He produces on those surfaces a coating of metallic sulphides analogous to those found in nature, as for example, sulphide of lead. These very stable snlphur combinations, as is well known, are not affected by ordinary agents. According to Puscher's method, in five minutes there may he imparted to thousands of brass articles a color varying from a beautiful gold to a copper red, then carmine red, then dark, then analine blue, to a blue white, like sulphide of lead, and at last a reddish white, according to the length of time they remain in the solution used. The colors possess the most beautiful lustre, and, if the articles to be colored have been previonsly thoronghly cleaned by means of acids and alkalies, they adhere so firmly that they may be operated upon by the polishing steel. To prepare the solution, dissolve 1½ ounces of hyposulphite of soda in one pound of water, and add 1½ ounces acetate of lead disaolved in half a pound of water. When this clear solution ia heated to 190° to 210° F., it decomposes slowly and precipitates sulphide of lead in brown flocks. If metal is now present, a part of the sulphide of lead is deposited thereon, and according to the thickness of the deposited sulphide of lead tho above mentioned beautiful lustro colors aro produced. To produce an even coloring, the articles to he colored must be evenly heated. Iron treated with this solution takes a steel blne color; zinc, a brown color; in the case of copper objecte, the first gold color does not appear; lead and zinc are entirely indifferent. If, instead of the acetate of lead, an equal woight of snlphuric acid is added to the hyposulphite of soda and the process carried on as before, the brass is covered with a very beautiful rod, which is followed by a green, which is not in the first mentioned scale of colors, and changes finally to a splendid brown with green and red iris glitter; this last is a very durable coating, and may find special attention in manufactures. Very beautiful marhleized designe can he produced by nsing a lead solution thickened with gum-tragacanth on brass which hae been heated to 210° F., and is afterward treated by the usual eolution of sulphide of lead. The solution may be used several times, and is not liable to spontaneous change.—*Technologist.*

Glass Bearings.

The uso of glass bearings for the wearing surfaces of cross-beads, pistons, and other working parts of machinery which has recently hoon introduced into some parts of the Eastern States is steadily extending and gaining favor. These bearings consist of pieces of glass inserted into the hearing surfaces as hereinafter described. In the slides of the cross-head they are simply imbedded ia holes drilled or cast to receive them, and in piston rings they are inserted in grooves turned in the rings. The following directions are given by the manufacturer for pntting in such bearings:

"Drill the holes full one-fourth of an inch larger in diameter than the glass is, and at least one-sixteenth deeper thau the glass is thick. The holes should be chipped nnder with a center chisel in soveral places in order to hold the babbit well. Then take a parallel piece of iron largo enough to cover the hole, and perfectly smooth on one surface, place a little oil on the smooth surface and press the piece of glass to it. By this means you exclude the air, and the glass and iron will stick together firmly; this is done in order to hold the glass up from the bottom of the hole, and thus allow the babbit to run under as well as around it, forming a perfect bed for the glass to rest on. Place the piece of iron with the glass fast to it over the holelin such a manner as to keep the glass in the centor, and also leave a small space uncovered through which to pour the babbit. The glass should be above the surface of the working part, in order to take the full bearing. Place at least one thickness of writing paper between the parallel piece and the other surface; clamp the parallel piece to the gibb or other part, for if not clamped the glass is likely to rise too high above the surface while the habbit is being poured. Caulk the babbit in several places with a blunt center-punch between the glass and iron, theu scrape it down to tho surface. Bearings put iu locomotive cross-heads should not be more than flush with the surface.

To insert tho bearings in cylinder packing-rings, eccentrics, etc., a groove should be cast or turned in the center of sufficient depth and width to allow the babbit to run under and around the glass; the groove should be turned nnder and also chipped rough on the sides. Then bend a strip of sheet-iron to the exact radius, and make the proper surface smooth, then stick five or six pieces of glass to the smooth surface by means of putty or any other substance that will stick well. Then clamp the sheet iron with the glass fast to it to the ring or other part; close up one end with putty, and pour the babbit in the other end. When the glass is all inserted, take oil and emery with a file and grind the glass down to the surface, making sure that not one of the glasses are above the surface when the ring is finished.

In parts where there is not sufficient thickness of material to allow the babbitt metal to he run under the glass, one thickness of muslin may be used as a bed for the glass to rest upon."

These bearings are now very exteusively used in locomotives and stationary engines, and the manufactnrer is furnishing them to all parts of the country and for all kinds of steam-machinery. Most persons, we believe, would be surprised to find how much rough nsage a piece of glass will bear if properly embedded in a soft metal. If they are well fitted they will stand a considerable number of quite severe blows from a hammer without being fractured.

THE manager of a furnace in Prussia, finding himself without fuel, resolved to keep the furnace alive as hest he might. He hegan at once to reduce the charge of iron ore to one-half, keeping all the while the nsual charge of coke, and after the furnace was thus filled, the blast was cut off, and all apertures were closed as air-tight as possible, and watched carefully so for more than ninety days anxiety. A regular supply of fuel being once more secured, after that time, the tuyers, heartb, and top were reopened, the hot blast let on, and twelve hours later the first clean cinder made its appearance, flowing over the wall-stone, to the great delight of all concerned.

A PRUSSIAN engineer has, it is said, invented a machine which will manufacture ice without chemicals, merely by compression and explosion of air.

SCIENTIFIC PROGRESS.

THE SPECTROSCOPE ON THE NEBULAR HYPOTHESIS.—Tho existence of immense nebulous masses, from which Laplace snpposed the solar system to have been derived, was thought to have been proved basclees by the increased power of modern telescopes, which havo resolved into clusters of stars many objects supposed to have been nebulæ. But since the spectroscope has been so improved as to he practically employed for determining the character of such distant bodies, the nebulous thoory is again coming into favor, if indeed it may not now he considered as fully established on a stronger foundation than ever hefore.

Prof. Kirkwood has made extended observations in this direction, in which the evidence in favor of the hypothosis is decidedly cumulative. Even progressive changes in the physical condition of eome of the aebulæ have been quite clearly indicated. In some parts of certain nebulæ nuclei have been established—the mass of gaseons matter evidently passing from ite attenuated form into a semi-solid state. The spectra obtained prove this fact beyond the possibility of doubt. This clasa of spectra reveals a constitution similar to that recently observed in certain comets belonging to onr own system.

VELOCITY OF METEORIC STONES.—It has been quite satisfactorily proven that meteors, before they meet with the retarding influence of the earth's atmosphere, often move with a velocity several thonsand times that of a cannon ball at the instant of its discharge. If a cannon ball could be made to move with such velocity it would almost instantly be destroyed, and disappear in a streak of flame. It is probable, however, that the impetus necessary to impart such a velocity would at once reduce to powder any brittle substanco like cast iron or stone. Meteors which enter tbe atmosphere at any considerable angle from a direct line toward its center are deflected from their course and soon move from its influence. Such is no doubt the caso with many which are seen to flit across the sky; while many, if not most of those which enter in a direct line, are dissipated into impalpable gasses before they have passed half the distance from the solar bounds of the atmosphere to the earth, or reach the earth in a state of impalpable dust.

ERUPTION OF METEORITES FROM THE SUN.—The theory of a solar origin for meteorites, however strange and startling it may at first sight be, cau by no means be condemned as altogether illusory. Advocated by Mr. Proctor in *Fraser's Magazine*, for April, 1871, much evidence in its favor has heen supplied by the recent solar researches of Secchi, Young and others. In brief, it is, that the solar prominences result from the shooting forth of liquid or solid masses or streams of matter, and that metcoric masses, or at least some meteorites, may have originated in this manner, being propelled from beneath the surface of the sun.

Mr. Runyard, in a recent communication to the Royal Astronomical Society, discussing the nature and origin of the upheaval of eruption prominences, states as his conclusion that the observed phenomena, and all other considerations, go far to render it probable that meteors are formed from the metallic vapors hurled from the sun or other stars, or that solid masses may be so hurled, in eruption prominences.

Mr. F. A. Fleming also remarks of this theory, that, offering as it does a possible account of the genesis of prominences and meteorites, it appears also to contain the germ of another hypothesis, which he develops, respecting the cause of the connection between solar eruption and terrestrial magnetism.

THE TRANSIT OF VENUS.—Professor Henry and other scientific men connected with the Smithsonian Institute and the Naval Observatory have nnited in an interesting memorial to Congress urging the appropriation of $150,000 to make extensive and thorougb preparation for observing the transit of Venus across the sun, which will take place in 1874, which is looked upon as the most important astronomical event that has occurred for many years. The last transit was in 1792, and excited so much interest in the scientific world that several European Governments made liberal appropriations to enable their astronomers to take observations. The transit of 1874 will not be visible in this country, and will be best seen from the islands of the South Pacific and Indian oceans. It is proposed to send naval expeditions to those points, accompanied by scientific parties. The Governmeuts of many of ,the conntries of Europe have already taken steps to this end, and there is little doubt that Congress will enable the astronomers of this country to have the same advantages as their foreign brethren.

THE proposed tunnel nnder Mt. St. Gothard will be ahout twice as long as the Mt. Cenis tunnel, and it will pass under peaks varying in hight from 8,750 feet to 10,000. The principal advantage anticipated from the work is an increase in the facilities for trade and travel between Europe and Asia, by way of Italy.

PASSIVITY OF IRON, CADMIUM, AND TIN.—Many years ago Faraday pointed out that when iron was plunged into nitric acid sufficiently concentrated, it became possessed of a surface condition which rendered it indifferent to the strongest acid; and which enahled it to form a voltaic circuit with ordinary iron. That such iron has really heen decidedly altered in character is also evinced hy the fact that it refuses to reduce copper from solution of its salts. Dr. Schön has observed that if cadmium is wrapped round with some platinum wire, it may be placed in strong nitric acid without being in the least degree acted upou; but if tho wire is removed the cadmium is instantly attacked, thus showing that the passivity of the cadmium is entirely due to its contact with the platinum. The author also states that when tin is treated in a similar manner it exhibits like pheuomena.

DANGEROUS GAS PIPES.—The *Journal de l'Eclairage* notices an accident which gives new proof of the danger attending the uso of copper gas pipes. In April last, a workman having with a triangular file cnt almost half through a gas-pipe of red copper ¾ inch interior diameter, which supplied the Liege station, was removing the tool, when an explosion took place, with a noise like the report of a rifle, and the workman wae much burnt. A similar accident happened subsequently, hut with less intensity, and the workman, who was not injured, did not report the circumstance. Some gas-pipes having heen taken down, they were found covered with a blackish coating, and they showed evident signs of corrosion from ammoniacal condensation. The hlack matter was analyzed, and was found to consist of acetylide of copper, which explodes between 203 deg. and 248 deg., producing water, copper, carbon, carbonic acid, and traces of carhonic oxide.

THE ESPY RAIN THEORY.—It is stated that notwithstanding the continued and wide-spread fires which prevailed for four or five weeks in Northern Illinois, last summer, devastating forests over a large area, not a drop of rain fell, as might have been expected, if the Espy rain theory is correct. The rain only came with a change of wind to northward, and several days after the worst burnings were over with.

On the contrary, heavy rains followed immediately after the great firo in Chicago. Possibly the occurrence of rain in the latter instance was due to the greater intensity and concentration of heat.

UNEXTINGUISHABLE SIGNAL LAMP.—Some experiments have been made in Tamise, with the unextinguishable self-lighting signal lamp of Holmes, and they promise a great snccess. The lamp is a cylinder of tin, with a conical top; the cylinder is filled with phosphuret of calcium, prepared by the inventor. When the lamp is plunged in water, this liquid, entering the cylinder, effects the decomposition of the phosphuret; phosphuretted hydrogen is disengaged in large quantity with vapor of phosphorus, takes fire spotaneously, and burns with a brilliant flame.—*Les Mondes.*

CLEANSING WOOL FROM BURRS.—The wool is soaked in a bath containing 2 lbs. alum to every 10 lbs. of wool and to this sulphuric acid added until the bath marks 6 deg. B. In this bath the wool shonld remain until its appearance shows that the bath has had its effect, when it must be taken out and thoroughly drained. It is then subjected to the action of a brushing machine which removes all the burrs.

THE GREENLAND METEORITES. — Professor Nordenskiold states that the masses of meteoric iron brought from Greenland by the recent Sweedish expedition soem to have formed the principle masses of enormous meteoric fall of miocene date, extending over an area of some two hundred square miles. The iron appears to be free from silicates. Professor Ramsey thinks the masses may be of telluric origin.

AN ACOUSTIC EXPERIMENT.—Let a wide glass tube, open at both ends, he taken, and in this a piece of fine wire gauze be pusbed up some little distance. If the gauze is now heated to redness over an ordinary Bunsen burner, and then removed, it will shortly emit a shrill note, lasting from 5—10 seconds. The experiment we believe will be new to most of our readers, and has the merit of always going off.

AN EXPERIMENTAL GAS WORKS.—The Germau Society of Gas and Water Experts have under consideration a plan for establishing an experimeutal gas works, for the purpose of deciding various questions which may arise in the details of their profession, by actual experiment. The proposed plau, if adopted, will be upon a large scale, so as to reproduce, as far as possible, all the conditions met with in practice.

LARGE SUN SPOT.—Professor S. P. Langley of the Alleghany Observatory, has computed the area of one of the spots lately visible near the center of the sun's disc, from careful measurement, and found it exceeded 2,300,000 square miles, which is more than ten times the entire area of the earth.

REMOVAL of spots made by sugar, from goods with delicate colors and much sizing. The spot should be rubbed with a damp cloth, and then with a piece of fresh bread, which will remove the saccharine matter without affecting the color.

THE principal supply of bismuth is derived from Bolivia, but it has recently been discovered in Australia.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior,in proximity to the mines mentioned

California.

AMADOR COUNTY.

BARLOW MINE.—Jackson *Ledger*, April 15: The workmen have etruck some exceedingly rich rock on the lower level, and there is every indication of a fine heavy lead being opened up soou.

QUARTZ.—Mr. McCauley, of the mine bearing his name, located below the Kennedy, is having about 80 tons of rock hauled to the Kearsing mill.

FINE ROCK.—Several pounds of quartz rock from the State of Maine mine were left at our office a few days ago, literally eparkling with gold. The rock was taken from the main ledge and is said to be not over the general average at present depth. Since reaching water level in sinking, the ledge has rapidly increesed in richness. The quartz heing taken out ie the regular ribbon rock. That in the office would mill at least $75 per ton.

BUTTE COUNTY.

INSKIP QUARTZ MILL.—Oroville *Record*, April 13: The mill, running 4 stamps, hes recently commenced work. A tunnel has been run some 300 ft., striking the ledge at a depth of ahout 70 ft. from the eurface, producing quartz which looks well and exhibits free gold. The mill is running upon thie rock, and those in cherge are feeling confident and happy.

RATTLESNAKE CREEK MINES.—Chico *Enterprise*, April 13: Charles Slocum, Richard Shepley, and Edward Fulton have "struck it big" in their claim on Rattleenake Creek, near Magalia (Dogtown). Last week they found a nugget of pure gold weighing 15 ozs., and another valued at $105, besides several emaller piecee. These large specimene are in addition to the ordinary yield, which is quite rich.

CALAVERAS COUNTY.

TUNNEL PROGRESSING.—Celaveras *Chronilce*, April 13: Champion, Colby & Co., who contracted to run a hedrock tunnel 800 ft. in connection with Clark's great hydraulic cleim at Railroad Flat, are making rapid progress. They have already accomplished 250 ft. of the distance through the hardest rock expected to he encountered. The ohject in running the tunnel is to facilitate the working of the hydraulic by ohtaining greater fall for the water ueed in weshing.

MAOHINERY.—The proprietors of the Prussian Hill et Railroad Flat are removing the French mill, in Rich Gulch, which they recently purchased, to the former place. A portion of the machinery hae already been freighted to railroed and the rest of it will be moved as fast as possible. A large amount of good rock is in readiness to be put through the hattery as eoon ae it is placed in position.

CRUSHING.—Clark'e mill at Reilroed Flat is cruehing a lot of rock from the old Frank Barney mine at Moequito. We are informed the yield will be large.

HUDSON MINE.—The ehaft on the Hudson at Central Hill has reached a depth of 120 ft. The ledge continues to develop most favorably.

COMANCHE.—Cor. same: Since water hae become plentiful mining has been resumed with energy. Tne Poverty Ber claims are all in operation. Mr. Story has 2 hydraulic claime in full blast, just helow that place on the Mokelumne river. At present he is busy running off surfece dirt. In most of these claime along the river the gravel is huried heneath a layer of sand some 30 feet or more in depth, which hee to be removed in order to reach the pay dirt. The Lipkeman claim, adjoining Storey'e is rushing things and I undereteud ie proving remunerative to the owner.

EL DORADO COUNTY.

AGAIN WORKED.—Placerville *Democrat*, April 10: The eoap etone ledge or quarry formerly owned and worked to some extent by Patterson, near Darlington's, is again being worked. Hollihan & Co. are now the proprietors, and ere opening the querry or ledge with a view to permanent operation.

FRESNO COUNTY.

WORK RESUMED.—Millerton *Expositor*, April 10: Work has heen reeumed on the Baltimore copper mine at Buchanan. The pumps were started np last week and the mine cleared of water.

NAPA COUNTY.

OAKVILLE MINES.—Napa *Reporter*, April 13: The Sup. of the Oakville mine eays that the prospect ie excellent. The mine is now rather being prospected than worked, and yet they are reducing from 8 to 10 tons per day of ore es it comes, ranging from 1 to 5 per cent. The monthly yield ie about 10,000 lbe., or 150 flasks. It is eetimated that there are at leest 10,000 tone of ore in eight.

NEVADA COUNTY.

BRICKS.—Grass Valley *Union*, April 9: We saw yesterday 2 gold hricks at Findley & Co'e. Bank, the clean up of the hlanket-ete for 2 weeks' run at the Idaho mine; the amount of which was 724½ ozs. of pure gold of the value of $12,675.

STARTED UP.—The Hope Gravel Co., which has been standing idle for several months, on account of the great body of water which had to he contended with, etarted up its engine yesterdey to pump out the mine.

GREENHORN.—Thie mine is improving with gratifying rapidity. The shaft is down 230 ft., and the ledge is from 18 inchee to 3 ft. in thickness. The ore is improving in quality with the size of the ledge.

SHIPMENT.—Friday, Findley & Co. shipped to S. F. gold to the value of $23,700.

TOWN TALK.—The last clean-up of this mine, for 2 weeks' run, from the hattery platee alone was 60 ozs., worth $1,320.

DAIEY HILL.—The ehaft at the mine is down 230 ft. to a new station. A drift of 15 ft. has been run, and preparations are heing made for taking out rock.

REESE & DEPEW'S CLAIM.—The celebrated Reese & Depew ground, on Randolph Hill, continues to pay. The ehaft has heen eunk 21 ft. in depth and the dirt taken out yielded $120. The amount of dirt waehed was less than a ton. The ledge has increased in eize and ehows iteelf to be more truly quartz than it did on the croppinge.

ITEMS.—The Gold Hill mill has heen kept quite husy eince favorable weather set in, in cruehing for different proepecting Co's. and the crushings have heen quite favorahle.

HUNT & Talhot have had 20 loads crushed from the Erie mine, which yielded in the aggregate $1,200 or $60 to the load.

DONAHUE & Ryan, from their cleim on Woodpecker ravine, have had a cruehing of 20 loads, which returned $784.75, or ahout $65.50 per load.

THE last crushing at the mill was from the Blue Lead Co's. claim, (being on the seme lead as the Ione and Union Jack) and the clean-up gave a reeult for 16 loads of 32.50 per ton. Work on the claim has been resumed lately (being suspended during the winter.) Last fall the pay chnte was from 18 to 20 ft. on the ledge; but at the present time, and from where the recent crushing was taken, the pay chute has widened from 45 to 50 ft., and is increasing in width ae work is continued downward on the ledge.

WILLOW VALLEY.—*Nevada Transcript*, April 11th: The prospects in Willow Valley are better this eeason than ever before. The Murchie mine, the Bnckeye, Buchannan and Bradley & Co.'s ledge are all yielding handsomely, and a number of othere are being prospected, At leaet 150 men will be at work before the Fall. Several other ledges have recently heen located, and the old Lecompton will he soon worked again.

RICH STRIKE. — The Buckeye Company, are working the Buckeye ledge at the heed of Willow Valley. They are down 200 ft., and on Tueeday they etruck very rick rock. It is filled with fine gold, and the ledge is about 3 ft. thick. On Tuesday Mr. Kitts brought in a specimen weighing 1½ or 2 lbs., worth about $20. The Buckeye hae hoisting works up, and they have out nearly 100 tons of rock.

BRADLEY LEDGE.—The ledge of Bradley & Roes, a quarter of a mile from the Buckeye, is heing worked. They are down as deep es they can go on account of water, and are preparing to put up machinery. The ledge is about 1⅛ ft. thick, and the pays from $40 to $60 per ton.

NEW MILL.—The Providence Co. has purchased the 10-stamp mill which etood upon the Green Mt. mine et Quaker Hill. The machinery hae all heen removed to the mine on Deer Creek, and the mill will be put up at that place to crush the rock from the Providence mine.

ENTERPRISE.—Mnrchie Co. are taking out lots of rock from their mine near Deer Creek, and the 8-stamp mill is kept in constant operation. They cleaned up lately from 100 tons of rock about 35 lbs of gold, and they have a ledge 2⅛ ft. thick, with plenty of new rock of the same kind.

MINING.—A numher of new mines are heing worked with good prospect. Out near the elaughter house on Mud Flat some excellent quartz has heen taken out. The Providence, Gold Tunnel, Rieing Star, Pennsylvania, Quartz and Gravel mine, the Pittsburg, Banner, Buckeye, Buchanan, Mono, Auburn and a number of othere are heing worked, and there is a prospect of the starting up of the California and Illinois. On Gold Flat, Deer Creek, Willow Valley, Rock Creek and in other localities a good deal of quartz prospecting ie going on, and the prospectors are meeting everywhere with good encouragement.

PLUMAS COUNTY.

STRUCK IT.—Quincy *National*, April 6th: Dr. Murtery & Co., who took up an extension claim on the Betterton ledge eome time since, have prospected the eeme and found it to be equally as good as thet of Betterton.

INDIAN VALLEY MINES.—John D. Compton is crushing constantly on high grade rock. His ledge is 4 ft. wide, and increaeing in width. Applegarth & Drake, at the Indian Valley mine, have their 32-etamp mill running on good rock from the east chute, which opens up splendidly. They have developed a large amount of rock which is first-claes. The Greenville, which is on the eame vein, is doing a good husiness, running their 12-stamp steem mill on rock which pays $20 per ton. Their new level, 450 ft. from the eurface, is nearly completed, which will give three yeare rock for a 24-stamp mill, which ie to be commenced at once. With thie addition they will he able to handle 60 tons of quartz per day. The Genesee Valley mine has a first-class vein of high-grade ore in sight.

SAN DIECO COUNTY.

BRICKS.—San Diego *Bulletin*, April 6th: During the week 2 hricks have been received at the bank from the Stonewall mine, weighing respectively 40 and 39 ozs.

SHIPPED.—Bullion to the amount of $1,275 wae shipped by steamer on the 4th inet.

BULLION.—Forty ounces of gold were received at the bank Wednesday, the product of the Ready Relief.

TRINITY COUNTY.

Weaverville, *Journal*, April 13: BIG THING.—The claim of H. Lorenz & Co., at North Fork, is paying well. A new and very rich channel hae been fonnd.

DISCOVERY OF RICH GRAVEL.—Whitmore & Co., in working the old Simonds claim on the southwest side of Trinity river, ahove Junction City, on a plateau 400 ft. above the river bed, tailed through a large flat—the water from the claim naturally cut its way through the red cement and gravel to the bed-rock, in its rapid descent to the river, exposing one of the richeet blue gravel leade ever seen in this county. The lead is 200 ft wide with an average depth of 20 ft. The lead as exposed runs diagonally through a level plain of some 200 acres that has been prospected in many places without striking pay-gravel.

CANON CREEK.—Cor. same: Wilt & Wolff Bros. made a partial clean-up in their Mogul Hill (hig blaet) claim last week, merely to prospectit, which resulted very well.

Nevada.

EUREKA DISTRICT.

PROSPECTORS.—Eureka *Sentinel*, April 10: A party of 4 prospectors left yeeterday for the Colorado gold mines. Another hatch leavee to-day.

MAGNOLIA.—Work is being vigorously prosecuted on the Newport series of the Magnolia Co.'e minee. The main shaft is down something over 130 ft. and the ledge ie continually widening and improving. The ore is said to be ae fine as any found in thet part of the dietrict.

LEMON Co.—The mill will eoon be ready for active operations, the White furnace being rapidly approaching completion.

CORONA CONS.—There are 8 claims consolidated under this organization, comprising eome of the most promising mines in the diet. The General Supt. will be here the first of next week with an ample working capital to put the mines in a thorough etate of development.

MORAY DIST.—We were honored with a call from Mr. Ogden, who represente a Co. of New York capitaliste whose property is located in Moray dist. 75 miles south from this point. The Co. are about erecting a large mill in that diet.

PINTO.—The various mines of the Co. are looking splendidly. There are large quantitiee of ore on the several dumpe. The mill will probably start up about the firet of May for a eteady run through thie summer.

ELY DISTRICT.

BULLION.—Ely *Record*, April 7: W. F. & Co. shipped to-day bullion valued at $14,937.23.

PIOCHE.—White Pine *News*, April 6: The shaft on the Bowery is down 200 ft. A level will etert to cut the chimney of ore found above in the 80-ft. level. Hoieting from the 100-ft. level from the weet side of the ehaft, and ehipping to mill. There is about 300 tone of ore on the dumpe. Material for hoisting works is on the way from S. F.

PAGE & PANAOA.—The ehaft, down 152 ft.. ie one of the finest timbered shafte in the district. The ledge was cnt at the bottom of the shaft. Have drifted 66 ft. eact and 20 ft. west. The vein ie from 4 to 5 ft. wide, ehowing hunches of fine mineral. The ledge was tapped on top of the chimney. The Supt. will sink the ehaft 200 ft. deeper in orderto tap the main ore-body. Hoieting works and reserving engine will be pnt up soon.

INGOMAR.—The Sup't ie pntting down a ehaft. It is said there is a fine body of ore in eight, assaying ae high as $450 per ton.

LEHIGH.—Sinking a vertical shaft to cut the ledge at a depth of 200 ft. The eheft is down 60 ft.

THE Bowery Mill, at Bullionville, commenced working on the 21st of March, and turns out bullion to the amount of $1,500 per day from the Bowery mine.

BULLION.—Reno *Crescent*, April 6: During the first 6 daye of thie month, there hae paseed through W., F. & Co.'s office, in Reno, 16,222 lbs. of hullion. The value of this will not fall ehort of half a million dollare.

WASHOE.

HALE & NORCROSS.—Virginia *Enterprise*, April 11: In the mine drifts to the southward are being run on hoth the 9th and 10th levels; the 10th corresponds to the 1,500-ft level of ths Savage. Theee drifte ere heing run in the rock lying weet of the vein, and are ahout 200 ft in length. In driving through the west country rock occasional etreaks of ore have been met with, which makee the Co. quite confident of finding good hodiee of ore when they come to cross-cut. When they are ae far eouth as they intend going, they will etart several cross-cuts on the drifte on the 2 levels named.

BIG WORK.—The new Eureka Mill, Careon river, iedaily prodncing 160 tone of ore, and all the machinery ie not yet rnnning. Soon the whole of the etampe will he started up, when 180 tone of ore will be put through the mill.

SAVAGE.—In the drift on the 1,500-ft level eome water was struck, and aleo some quartz which promises well for ore. The ore body on the 1,400-ft level, near the winze, is improving in appearance.

GOOD ORE.—A body of excellent ore, ahout 4 ft in width, was etruck in the incline from the upper tunnel of the Globe, day before yesterday. The ore was found at the bottom of the incline, ahout 60 ft helow the level of the tnnnel. An aceay of what wae selected as average rock went $42 40. Some very good ore has also been found in the raiee from the tunnel of the Arizona and Utah, a mine adjoining the Globe on the north and on the eame lead.

SUTRO TUNNEL.—The Tunnel wae in on the 7th inst. 2,821 ft—ground hard. Shaft No. 1 is down 145 ft; No. 2 ie down 327 ft; No. 4 ie down 172 ft; No. 4 ie down 145 ft. In the last mentioned ehaft the ground is very hard and a considerahle quantity of water is coming in.

NEW MILL.—A new and first class mill will ehortly be erected on the eite of the old Rock Point mill at Dayton.

MARCH YIELD.—During March there was worked of Crown Point ore 10,753 tons, which yielded $630,848 01—heing at the rate of $58 67 per ton.

CON. VIRGINIA.—Thie Co. are actively engaged in opening out and re-timbering varione drifts and tnnnele on the 500-ft level. They are getting things into ehape for active operations.

BIG YIELD.—The yield of ore of the Crown Point for the week ending April 5, wae 3,003 tons. The eetimated value of that eent to the mille was $197,793 56.

BULLION.—We yeeterday eaw npon the connter of the Bank of Cal. eilver bricks to the amount of $100,000.

THE new Overman sheft ie down 690 ft and the Caledonia shaft is down abont 600.

THE Yellow Jacket Co. are taking out ahont 100 tone of ore per day, and at the same time are doing a considerable amount of deep prospecting.

OPHIR.—The drift eonth on the 1,100-ft level is in 138 ft eouth of where the main drift from the ehaft cuts the lead. It ie heing rnn in the east conntry, and during its progress numeroue streaks of qnartz have been cut. Though these streake contain no ore, the rock ehowe by aesay a emall per cent. in gold and eilver. When the crose-cute are made 4 or 5 will be etarted at once. The drift north on the

same level is in 108 ft. The indications in that direction are not so favorable as to the sonthward. On the 1,300-ft level the drift west, toward the lead, is in 30 ft.

THE LOWER LEVELS.—The indications in the 1,100-ft level of tho Ophir are quite flattering and the grounnd at tho bottom of the Imporial Empire shaft is presenting a more lively appearanco than has yet been observed in any deep workings in that vicinity. In fact, throughout the whole length of tho Comstock tho "situation" is most flattering.

JUSTICE.—The wator is lowerod in the main shaft to a point 36 ft below tho third station. The shaft will bo drained in about 4 days, when the Co. will bo ready to resume work on their east drift. This drift is in 80 ft, and it is expected that the load will be cut in goiug a furthor distance of 25 or 30 ft.

CROWN POINT.—Gold Hill *News*, April 6: By means of doublo cagos and the best hoistiug machinory on the Comstock ledge, about 500 tons per day is the yield of this mine. Tho working levels in the rich deposit are yielding well and regularly, and the assays of ore from the 1,200-ft levol average nearly $100 per ton. The extent of this great ore body is undefined and simply immense. The product of the mine during tho prosent month will prohable bo $1,000,000.

IMPERIAL EMPIRE.—Tho great shaft of the Imperial and Empire Co. is 1,300 ft deep, and the bottom being in the hard, west country rock, an incline was started from the 1,300-ft level, followiug tho west wall of the lodge at an angle of 42 deg. When it reached the 1,500-ft level of the mine a station was opened for a developing drift at that point, and the incline continuod down 175 ft further in length, attainiug a perpendicular depth of 1,600 ft. Another station will soon be opened, when the ledge can he prospected at two vital points. The inoline is still boing continued. The rock is very hard, but blasts well, and good progress is made. No water is encountered at that depth. The old mines of the Co. are not being worked at present, but both combine in this great shaft.

WHITE PINE.

BULLION.—W., F. & Co. shipped from this city, to-day, to London, for Eberhardt & Aurora M. Co. (limited), 3 bars, weighing 207 lbs., valued at $3,882.04.

TREASURE HILL MINES—NORTH AURORA. Since last review the Eberhardt & Aurora Co. have leased the right of way through the Sonth Aurora tnnnel. A contract is let to rnn throngh to the Risdale shaft. There is a strip of unprospected ground between the south line of the North Aurora and the Risdale shaft, and the probability is that another chamber of ore will be fonnd before connection is made with the Risdale chamber. The tunnel will tap the ore body at a greater depth than any of the present workings. The ore in the Risdale chamber has increased in body since last mentioned in our report, and the grade has not changed. Hoistiug day and night through the Risdale shaft. Seventy-five tons of ore are raised every 24 hours, that mills over $100 to the ton.

SOUTH SHEBOYOAN.—A tunnel is being run in from the O'Neil Grade to cnt the ore deposit. The formation is shale. Only one shaft at work. It goes ahead at the rate of 3 ft. per day. Should the rock remain as favorable as at present, the ore-body will be reached inside of 2 months. The tunnel is in 60 ft. It is calculated that 90 ft. more will cut the ore.

EBERHARDT.—Breasting out south of the Keystone shaft. The ore is piled back at present. As soon as the weather moderates it will be shipped by tramway to mill.

SECOND SOUTH EX. OF HIDDEN TREASURE. Since onr last visit a drift has been started to run south from the bottom of the Anchor incline. There is a fair quality of milling ore in sight. The grade has improved since last examined. The drifts running to connect the North shaft with the Auchor are making good headway.

WARD BEECHER.—The east drift from the Lady's chamber is under tho winze of the Lady's chamber. As soon as winter subsides, a force of men will be put on in the open cut. It is estimated that there are 5,000 tons of fair milling ore in sight in the different openings.

BEECHER CON.—The east drift is going ahead in good ore. It is rumored that the mine will start up with a full force of men, when the Supt. arrives.

SAN JUAN DEL RIO.—Work on this mine goes ahead as usual.

EAST SHEBOYOAN.—The ore in the ore-chamber and west cross-cut holds up to the nsual grade.

SOUTH AURORA.—A force of 6 men is employed sinking the shaft in the east drift. Work is snspended for a time in the other workings of the mine.

NOONDAY.—A force of 5 men is at work hreasting out.

SILVER WAVE.—Supt. Fleming has let a contract to sink the Perkins shaft 50 ft. deeper. A fair quality of ore is extracted from the Boswell shaft.

COPPER GLANCE.—Ore of a fair grade has been found. A drift has been pushed ahead for the purpose of finding the extent of the ore-body.

SCHELL CREEK MINES.—Tho El Capitan and Woodburn mines havo been purchased. Tho undorstanding is that mills will bo erected at an early day. The miues at Ruby Hill, whore openings havo beou mado, show rich ore. The great want is custom-mills to work the ore.

Colorado.

ITEMS.—*Colorado Miner*, April 6th: G. W. Hall crnshed, sacked and shipped, since last roport, 45,474 lbs.

Campbell & Clark shipped, for March, ou account of owners, 31,348 lbs.

Baily & Nott shipped, siuce last week's report, 20¾ tons. On hand and sacked for shipment, 250 tons.

Palmor & Nichols have resnmed shipmonts of bullion. Bar No. — weight, 654 90-100 ozs., silver; fineness, .736; value, $623.20 coin.

Thoro were crushed, sampled and sacked, during March, at the Snowdrift Co.'s mill, Silver Plume, 164,911 lbs of ore, varying in value from 60 to 1,300 ozs. of silver per ton of 2,000 lbs. Nearly all the ore was shipped to England.

Idaho.

MINING AFFAIRS.—Idaho *World*, April 4: On Buena Vista Bar, Headen & Co., Peak & Co., and one or two others this side of Warm Springs, are working night and day, and above them 4 or 5 Chinese Co's, employing about 130 men, have heen runuing for 2 or 3 weeks past. Above town, on North Elk, Silsby, Barrows & Co., who leased Baldwin's ditch, are at work uear the mouth of Cuddy's Gulch, and in that immediate vicinity Rush & Co., J. Collins and P. Donohoe are also at work, Rush & Co. running day and night with a good head of free water, having already run off a large extent of ground. On Deer Creek, above that point, Tanner & Co., Preuss & Co., Webster & Cowan, Swain & Co., and Bell are making the best use of their time and water; while in Spanish Gulch, Stirmau and 4 or 5 other Co's are prosecuting work in a lively manner. On Bear Run, Keller & Bidwell and West & Ralston have been working 10 days or 2 weeks past, and are ruuning any amount of tailings down into the upper portion of Main St. None of the long ditches have, as yet, been cleaned out, but work is being done on the Alderson ditch, and it is expected that they will get the water through in from 10 to 12 days. Next week work will also be commenced on the Big Ditoh for the purpose of getting the water through as early as possible, but nothing will be done on the Moore Creek ditch for 2 or 3 weeks yet. Willis has got the water through his upper ditch, upon Gold Hill, and is working his claims near Lincoln Gulch, ahd K. P. Plowman expects to have water running in his ditch in a few days, to commence work on his claims in Bear Run Gulch.

Montana.

NEW DISCOVERY.—Helena *Gazette*, April 1: Yesterday we saw some rock from a silver lode recently discovered near the head of Clancy Creek. The new discovery is called the Little Giant, and at 6 ft., has a solid body of one ft. of ore, which assays $114 to the ton, on an average from several assays.

BEARTOWN.—Deer Lodge *Independent*, April 6: The miners are elated at the prospect of a good season. Robt. Fenner and Michael Laforcate, at the Top of Deep, have put in 1,000 ft. of fluming, and built a large reservoir. They have a hydraulic and intend working night and day. Hawley & Co., have been prospecting a bench on Deep, 100 ft. above the gulch, opposite No. 61 below Discovery; they have ruu a tunnel 40 ft. and sunk a shaft 16 ft. deep, and are digging a ditch to bring water on the ground. There are 5 Co.'s on Elk Creek who value their claims at from $10,000 to $25,000 eaoh. Mr. Hyde, our informant, was shown some rick specimens of gold-bearing quartz taken from a lead at the head of Frst Chance. Ten men are starting in to work the new mines ou the Flint Creek Hills, a ditch 4 miles long having been brought in last season for that purpose.

Some gentlemen were up at Cariboo 10 miles southeast of town, this week looking at some quartz lodes with a view to putting up arastras for working the same.

The Rock Creek Ditch Co. have men engaged cleaning ont the ditch prepatory to turning in the water.

Lew Smith & Co., havo gono up to their mines on Lost Creek with the intention of commenceng work.

The water will be turned into the Miuers Ditch at Fredrickson tho coming week.

GERMAN GULCH.—Ford McCleory & Co., have commeuced work; several other Co.'s expect to commence work next week.

PHILIPSBURG.—Both mills are running. Brown & Plaisted cleaned up about 400 lbs. of hullion from 15 days rnn, on ore from tho Eastern Comancho, Dashaway and Horton. Mr. McArdle, Sec. of the St. Louis & Montana M. Co. and Mr. Newoomer brought up 60 lbs. of hullion from Col. Lyon's mill, taken from Speckled Tront oro. This hullion is worth about $10 per lb. Brown & Co. aro engaged takiug out oro from the Rumley & Bugher mine. Tne lode in some places is 40 ft. wide, and carries its width as far as developed.

Utah.

BIG COTTONWOOD.—S. L. *Tribune*, April 9: The Illinois and French mines have been worked through the wiuter, yielding a large amount of good ore. The Sailor Jack and McDougal, on Gesler's Peak and the Two Robinsons and Little Giant, in auother portion of the coñon, are all being developed to a good account. The Reed and Benson mine will start up in a few days.

CAPT. SHAW who is erecting a mill at Camp Floyd for an English Co. owuing mines there, is sanguine of large results, having already abont 1,800 tons of ore on the dump to start on, and, with the mines developing richer every day, he expects to ship about $40,000 worth of bullion per month.

STAR DIST.—Among the leading developed mines are the Indepeudence, London, Liverpool, the Pitney, Ruby, Frankland, Eclipse, all on Ruby Hill. The ledges are located in a quartzite formation, which indicates permanency, and are clearly traceable for 1½ miles in the hill. They ruu from 3 to 7 ft. in width, increasing as depth is attained. The ore is free milling and very rich, the average assays running from $94, the lowest, to $2,000 the highest.

S. F. Stock Exchange Board.

SAN FRANCISCO, April 18, 1872.

The sales at the Board for the week ending the 12th inst. aggregate the unprecedented sum of $7,183,700. For the first three months of this year they have heen as follows: January, $17,778,915; February, $24,774,331; March, $17,629,387, making an aggregate of $60,182,633 for the quarter. For the same time in 1869 it was $21,737,500; in 1870 $13,660,000, and in 1871, $21,701,725. These figures will show the magnitude of the operstions for this year. The Crown Point mining Co. paid out last week in dividends $300,000; the Belcher, $208,000; Eastport Coal mining Co., $2,500; Keystone Co., $7,500; Raymoud & Ely, $210,000; Yuba Gravel mining Co., $5,000; and this week the Meadow Valley miue has dishursed $90,000.

The Chollar-Potosi mine turned out last week 967 tons of ore assaying $43.03. The Crown Point yielded the enormous amount of 3,037 tons estimated at $188,000. The March expenses were $203,515 and the receipts $630,848. The War Eagle sent down this week $11,631. The Savage produced last week 600 tons of ore assaying $47.68 and the Hale & Norcross 540 tons. The Hale and Norcross Mining Co. at a meeting to-day increased their capital stock from $1,600,000 in 8,000 shsres to $3,200,000 in 16,000 shares. The meeting of the Consolidated Virginia to he held on May 20 is for the purpose of taking into consideration a proposition to increase their capital from $5,800,000 in 11,600 shares, to $7,080,080 in 23,600 shares of $3.00 each.

The stock market has heen more active and excited during this week than ever before in its history. Everything hss gone up at an unusual rate and everybody is investing in stocks. Washoe descriptions hold the lead. The sessions of the Board have heen prolonged and the street business has heen heavy. The numher of people who are engaged in buying stocks are large and all those who weut in early have sold out with handsome profits.

On Friday the excitement was great and the business was so large that only part of the list was called at a time. The Board went in half an hour earlier that day and held only one session on scconnt of the funeral of a member. Saturday there was no abatement in the excitement and the whole list of Washoe stocks still continued to rise. Monday, market again active and prices rising, and at the second session the further advance was surprising, consideriug that nearly all kinds were unusually high, and a general fall was expected. The market value comhined ou that day of Alpha, Belcher, Chollar-Potosi, Confidence, Cousolidsted Virginia, Crown Point, Exchequer, Gould & Curry, Hale & Norcross, Imperial, Kentuck, Overman, Savage, Segregated Belcher and Yellow Jacket was $54,518,000 while at the same date in 1871 they were all worth together only $9,064,200 according to value of stock. The incrcasc was, $45,453,800. Wednesday, stocks were still active and the Board held a long scssion, and it is proposed to employ short haud reporters to expedite husiuess since it is now impossible to write it up. To-day (Thursday) operations are still active and they have in fact heen prolonged ou that basis to a greater time than was anticipated. The session to-day was very active hut a general depreciation of prices is anticipated and it only remains to be seen who comes out "second best."

QUARTERLY DIRECTORY.—D. M. Bishop & Co., publishers of the "S. F. Quarterly Trades Guide and Merchants' Directory," announce their intention to add to their publication a complete business directory of every place in the State.

Steam Communication and Engine Power for Isolated Mines.

The large number of enterprises recently introduced to the notice of British capitalists, and connected with the development of the enormous mineral resources of the far western portions of the United States, has led to many inquiries as to how it happens that men so admittedly acute as the Americans should offer valuable mining concerns in the English market instesd of retaining them for themselves, and the almost invsriable confirmation of the vendors' statements as to the intrinsic value of the minerals by independent English engineere to clear up the mystery. The facts, however, are extremely simple. Most of the mines are situated so far from railways, etc., that it is not profitable to carry the ore to market, and the necessary plants and machinery cannot be got to the mines without far larger capital than the ownere have at their disposal, especially where, as in many cases, the mines have been heavily encumbered to obtain the requisite funds for prospecting and proving the mine; but when once the mine is furnished with a good park of machinery there is nothing to fear, for as bullion is carried at the same price per ton as ore, the profits on sending it down are ample.

The profits earned by the companies already on the English market have been eminently satisfactory, yet most of the mines would have been far more advantageously placed had they had facilities for cheap and rapid transport, and for the erection of ample machinery at the mines. In countries so thinly populated as Utah, Colorado, New Mexico. etc., the construction of railwaye must, for sometime, be so limited that comparatively few will be benefited by them; but now that it has been demonstrated that a speed of 20 miles an honr can be obtained with a traction-engine of eubstantial coustruction, there is no reason why any mine within 1,000 miles of a railway should not be brought within forty-eight hours of established communications, especially when the route is through fertile valleys, where there is an abundance of fuel and water to keep the traction-engine going. With snch means of communication there should be no difficulty in keeping the mines well supplied with materials, without much additional expense, as compared with the prices paid at the nearest manufacturing cities.

In mining operations, moreover, considerable advantage results from plenty of steam-power being at disposal, and in providing thie (aided by modern inventions) a mine a few hundred miles from a line of railway is really no less favorably situated than one but a few miles distant. Tube boilere, no part of which weighs more than ¾ cwt., are eo easily conveyed on the backs of mules, or even of men, when absolutely necessary, that steam equal to 300 or 400 horse power can be readily had in the most isolated district. With boilers of this class the quantity of steam generated depends simply upon the number of (say) 60 lb. tubes used, and as all of these are filled with water, and in communication with one and the same steam chamber, which may consist of a tube capable of bearing a maximum pressure per square inch, explosions, with their attendant delays, are almost impossible. Assuming a traction-engine line to be established between the mines and the railway (and thie really involves but the ontlay for the price of the engine), carriage of boiler sections and parts of engines would offer no difficulty whatever, and all delays in putting such mines in profitable operation would be at an end.

In Australia and South Africa there is the great difficulty arising from the absence of water and fuel, but on the Pacific elope of the United States there is abundance of both, so that the eetablishment of good traction-engine lines in those regions would be alike advantageons to the miners and remunerative to those supplying the capital to purchase them.—*London Mining Journal.*

Farming One Hundred Years Ago.—In 1790, Franz Fuse, of Bohemia, one of the authorities of hie age, spoke of the prevalence of the inventive spirit, which he donounced. He was himself a witness that "the folly had been pushed to euch an extent" that people were trying to make eowing and reaping machines. But he "thanked God" that the farmers had still *some* judgement left, and thus these stupid efforts to get something new met with their proper reception—neglect.

The stock of mill iron ie lower than it has been for years.

Gould and Curry Improvements.

The Gould and Curry Company, says the Virginia *Enterprise* of the 4th inst., are making very extensive and important improvements at their main shaft. The old hoisting frame and all connected therewith is being taken down preparatory to the erection of new and more powerful and substantial hoisting machinery. The works were shut down day before yesterday for the purpose of making this change, and the new works are in such a state of forwardness that they will be ready to start up in about ten days from the present time. A new and most substantial fireproof building of etone and brick, forty by eighty feet in size, is being erected over the Bonner shaft, and in this is now being set up a new and powerful hoisting engine. This engine is of the same capacity as the large new engines in use at the Crown Point and Belcher mines, and it will be used for hoisting up from the new incline about to be commenced below the 1,500-foot level. All the machinery is very heavy, the fly-wheel weighing 6,200 pounds, the spur-wheel 9,600 pounds, and all else in the same proportion. The opening for the commencement of the incline is completed, and now stands the largest untimbered cavity on the Comstock range, being a grand artificial cavern forty-two feet wide by sixty-five in highth. But that this work is done in hard blasting-rock it would be very nnsafe to make so large an opening without socuring it with heavy timbers.

The bottom of the Gonld and Curry shaft is now lower than any other point reached by the Comstock. The bottom of the shaft is 1,800 feet below the surface, and below this has been eunk a sump twenty-one feet dceper. At the bottom of the sump has been blasted out, to the westward, in the solid rock, a reservoir capable of holding 35,000 gallons of water. The bottom of the shaft and bottom of the sump are perfectly dry, but it was thought best to make the reservoir in order that any rush of water (from any source) could be controlled. It is not likely that they will ever be troubled with water from below, but in case of accident to the pumping machinery that above might flood the incline, in case no receptacle for it was provided at the bottom of the shaft. The new building will be covered with an iron roof, and every precaution taken to guard against fire from the row of frame buildings standing immediately to the west. An improvement worthy of note in the sheaves of the hoisting frame, over which the wire cable will run, is that they are all lined with wood. This improvement was the suggestion of Mr, Lackey, Superindent of the mine, and is one which will doubtless be adopted in all our leading mines. The cable running over wood, instead of iron, will prevent the weakening of the strands by cryetallization. Workmen swarm about the shaft and everything is in such a state of forwardness that we have no doubt of the new works being ready to start up at the time mentioned.

Legends of the Yellowstone.

Here, the trappers tell us, is the "mother region" of the gold, where the Indians told Father de Smet it was found on the surface. Here are the burning plains, so testifies Bridger, at the head of the Yellowstone, and large lakes, and boiling springs like the geysers of Iceland. Here he eaw his Two Ocean River, which, after flowing for some distance, eeparates into two large etreams—one traveling to the Atlantic, the other to the Pacific. In one of these vales is a large tract of sage brush, every leaf and branch perfect, and here and there are rabbits, sage hens, and even Indians, all turned to solid etoue. Ill fares it with whosoever penetratee these mysteries, for the genius of the place at once adds him to the group of statuary. More wonderful still—and our trapper told it with great awe—these bushes bear rare fruit—thousands of rubies, sapphires, diamonds, emeralde large as walnuts. "I tell you, sir," said one veracious narrator to Captain Reynolds, "it is true, for I gathered a quart myself, and sent them down the country." A party of whites were once hotly pursued by Indians, and could only travel by night, when they were aided by the brilliant light shot from a huge diamond in a neighboring mountain, by which they traveled on for three coneecutive nights. Here once an old trapper was loet on his road from Fort Laramie to Taos, and wandered for many days; and in drinking from a stream found pieces of yellow metal large as hazel-nuts which he carried to Taos and found to be gold. He spent many years seeking the place again, but in vain. These and many other legends and traditions of these regions the trapper gave us as truths familiar in the mountains as household words, which it would be impious to doubt.—*Lippincott's Mag.*

Cone of Sequoia Gigantea.

This Sequoia is a native of California only, and though ranked among the tallest and largest of trees, its seed bearing cones are among the very smallest of all the conifers. The trees are found principally in Calaveras, Mariposa and Fresno counties, but are seen in a few other placer in the Sierra Nevads. They attain a hight of between three hundred and four hundred feet, with diameters from one inch at a year old, to 37 feet, or 112 feet in circumference at the base of the trnnk.

There was one tree in the Calaveras grove that when first discovcred was prostrate, that

must have messured when in the vigor of its growth very nearly 450 feet high. The grove was first discovered by one of a party of American miners on a hunting expedition in the mountains in 1850. The seeds have heen widely disseminated and the trees are now found growing luxuriantly in nearly all parts of the United States, England and many places on the European continent, apparently as healthy and vigorous as in their native soil.

The illustration herewith given shows the natural size of the cones.

California Pears in Europe.

C. W. Reed, of Yolo county, last fall as a matter of experiment shipped several hoxes of Easter Beuree pears to different points in England. Some to London, some to Glasgow and some to Liverpool. The pears were shipped late in the season and were in the snow blockade on the railroad from three to four weeks. Some went hy the way of Boston, and some by the way of New York.

He has lately received an account of the expcriment. The pears sent by New York arrived in perfect order, and condition; while those sent by Boston had apparently been touched by the frost and were in rather poor condition.

On the whole, the experiment is regarded by Mr. Reed as a perfect success, and proves that California pears can be laid down in any of the above named cities in a good merchsntable condition. It also satisfies Mr. Reed thst pecnniarily the husiness will pay.

In confirmation of the above, B. S. Fox of San José, sent some pears to Ireland, his old home, and although it was a small shipment to friends, it proves that the fruit can he shipped and arrive in good condition. These experiments are of great value to our State. We have already a large market in the Atlantic States for our fruits, and particularly for pears, hut if we can supply England with her millions of people, with our delicious pears at remunerative prices, we have a market literally beyond our ability to supply. Our fruit growers will make a note of the above facts.

Dr. Franklin's Toast.—Dr. Franklin once dined with the English and French ambassadors, when the following toasts were drunk:

The British ambassador said:—"England —the eun whose bright beams enlighten and fertilize the remotest corners of the earth."

The French ambassador, glowing "with national pride, but too polite to dispute the previous toast, drank:—"France—the moon whose mild, steady and cheering raye are the delight of all nations, coneoling them in darkness, and making their dreariness beautiful."

Dr. Franklin then arose, and, with his usual dignified eimplicity said:—"George Washington,—the Joshua who commanded the eun and the moon to stand still, and they obeyed him."

Animal Power.

Eritors Press:—Allow me to ask the following questions, viz.:—

1st. Working a horse or an ox all day, how much—taking in account their respective weight—can they pull and not be over worked?

2d. What is equivalent in the working capacity of three oxen, in horse power?

3d. Pound for pound, which will pull most easily, a desd load, like corn, or a springy one, like hay? T. F. B.

Marengo Rsnch, Los Angeles Co.

In the foregoing qneries there are a few nice points involved. We once took a contract for hauling wheat by the ton a distance of ten and a quarter miles over a generally level road, but with 2 or 3 elevations and depressions of about a fourth of a mile in length each, and of about equal ascent and descent; other than this, the road was hard and good. We put on two new wagons of the same size and weight, and made hy the same man. To one wagon we put a pair of large common farm horses, and to the other a large, good yoke of oxen.

We commenced by hauling a single ton on each wagon, every day with no return load but the empty wagons. Both horses and oxen were fed an equsl quantity of ground feed each, and all the good hay they would eat. Both teams left at the same hour in the morning, but the horses would arrive home three hours the first, heing able to trot most of the way returning. The distance both ways amonnting to twenty and a half miles a day; we found at the end of a single week that the horses—to use a farmers' phrase—held their own, whilst the oxen were losing weight and suffering from fatigue, as they would lie down, almost immediately on bcing turned out, and sometimes before they hsd finished their food.

We now hitched on another yoke of oxen, nearly equal in strength to the first; but the result after another week was the same; the four oxen were more fatigued than the two horses drawing equal loads and changing wagons every day from horses to oxen, so that any differcnce in case of draft would he equalized. It was evident, therefore, that the distance traveled, was whst was worrying the oxen and not the weight of the load. We now put two tons upon the two yoke of oxen and wagon and taking one dsy to go and the next to return; the horses being loaded and going daily as before. After two week's work, the oxen doing the same amount of work as the horses in the same time, were every day improving till the job was completed.

During the whole time, the load for the horses was an even ton weight or averaged that day by day; and with thst load, it required full feeding with ruhhing down and much care, to keep the horses up to their starting condition. On all good roads we should prefer horses before oxen; but in all bad places or in timbered land, where the labor is logging or getting around among brush and bad places with stumps and rocks or mudholes, the paticnt ox is to he preferred.

An elastic weight, as feathers or unpressed hay, against a dead weight as corn or lead, pound for pound, the elastic material will draw the easiest. First, becsuse the *whole load* of the elastic substance does not start at the same instant, and it is easier to start half a load than the whole of it at once; and secondly, because the elastic load will allow of the wheels rising over short inequalities or small stones without crushing them, which if it did crush them would reqnire extra power, because, with the dead weight you would expend the same power in drawing the load proper, and the additional power required to crush the stones. If our correspondent should hold to a different view than we have expressed, we would be pleased to hear from him.

Value of Slow Reading.—Frederick W. Robertson, the distinguished Englieh preacher, once wrote to a lady friend: "I never knew but one or two faet readere, and readers of many booke, whoee knowledge was worth anything. Miss Martineau saye of herself that ehe is the slowest of readers—eometimee a page an hour. But then what she reads she makes her own. Girls read too much and think too little. I will answer for it that there are few girls of eighteen who have not read more booke than I have; and ae to religioue books, I can count upon my fingers in two minutes all I have ever read. But they are mine.'

The President of the Northern Pacifio Railroad company denies the statement that a quantity of railroad iron had arrived in New York from England for the above company, and says that it is the intention to use none but American iron on that road.

Useful Information.

The Nature of Different Resins.

Dr. Sacc, of Neuenburg, Switzerland, has made an extensive inquiry into the nature of different resins. We condense from it the following results. The resins spoken of are copal, amber, dammar, common resin, shellac, elemi, sandarach, mastic, and Caramba wax. All these resins can be reduced to powder.

The following will become pasty before melting: amber, shellac, elemi, sandarach, and mastic; the others will become liquids at once.

In boiling water, Caramba wax will melt; common resin will form a semi-fluid mass; dammar, shellac, elemi, and mastic will become sticky; while copal, amber and sandarach will remain unchanged.

Dammar and amber do not dissolve in alcohol; copal becomes pasty; elemi and Caramba wax dissolve with difficulty; while resin, shellac, sandarach and mastic dissolve easily.

Acetic acid makes common resin swell; on all the others it has no effect.

Caustic soda dissolves shellac readily, resin partly; but has no influence on the others.

Amber and shellac do not dissolve in sulphate of carbon; copal becomes soft, and expands; elemi, sandarach, mastic, and Caramba wax dissolve slowly; while resin and dammar disaolve easily.

Oil of turpentine dissolves neither amber nor shellac, but swells copal; dissolves dammar, resin, elemi, sandarach, and Caramba wax easily, and mastic very easily.

Boiling linseed oil has no effect on copal, amber, and Caramba wax; shellac, elemi, and sandarach dissolve in it slowly; while dammar, resin, and mastic dissolve easily.

Benzine does not dissolve copal, amber, and shellac, but does elemi and sandarach to a limited extent, and Caramba wax more easily; while dammar, resin, and mastic offer no difficulty.

Petroleum other has no effect on copal, amber, and shellac; it is a poor solvent for resin, elemi, sandarach, and Caramba wax, and a good one for dammar and mastic.

Concentrated sulphuric acid is indifferent to Caramba wax; it dissolves all resins, imparting to them a dark brown color, excepting dammar, which takes a brilliant red tint.

Nitric acid imparts to Caramba wax a straw color; to elemi, a dirty yellow; to mastic and sandarach, a light brown; it does not effect the others.

Ammonia is indifferent to amber, dammar, shellac, elemi, and Caramba wax; copal, sandarach, and mastic become soft, and finally dissolve; while resin will dissolve at once.

It is not difficult by means of these reactions to test the different resins for their purity.—*Deuzlin, Polythenic Journal.*

Experiments About Heat.—The Providence *Journal* gives the following interesting experiments made in that city with an excellent glass-mounted thermometer.

In the house with open windows it stood at 90.2°. Out of door in the shade at 95°—freely suspended in the sun six feet above the greensward 99.5°. In the same position with wet bulb 79.9°.—with bulb covered with black silk, 109.96°. When laid upon the grass in the sun it rose to 104°. Laid upon white cloth, placed upon the grass, 105.0°, and when similarly placed upon black silk it indicated 113°.

The experiments with different colored coverings show very conclusively the utility of light colored clothing for those who are obliged to be exposed to the direct range of the sun at high temperatures—and the experiment with the wet bulb shows as clearly the value of free perspiration in keeping down the temperature of the body, which, however, the observer finds in his own person, notwithstanding the perspiration while making these experiments, to have risen to 100.5°—which is about two degrees above the usual standard for cooler days. The average temperature of the healthy human body throughout the year, in temperate climates, is 98.4°—while in tropical regions it is about one degree higher.

The large clock at the English Parliament House is the largest one in the world. The four dials of this clock are twenty-two feet in diameter. Every half minute the point of the minute hand moves nearly seven inches. The clock will go eight and a half days, but it only strikes for seven and a half, thus indicating any neglect in winding it up. The pendulum is fifteen feet long, the wheels of cast-iron, the hour bell is eight feet high and nine feet in diameter, weighing nearly fifteen tons, and the hammer alone weighs more than 400 pounds. This clock strikes the quarter-hours, and by its strokes the short hand reporters in the Parliament chambers regulate their labors. At every stroke a new reporter takes the place of the old one, whilst the first retires to write out the notes he has taken during the previous fifteen minutes.—*Ex.*

Ivory is bleached by exposure to sunlight. For piano makers and others, it is prepared by first sawing it into thin sheets or plates. These are placed on suitable frames, under glass, and exposed to light for several months. The frames are of peculiar construction and patented. They are so arranged as to shift, thus reversing the exposure of the ivory, so that both sides may be duly acted upon by the light.

Long and repeated boiling injures glue.

Sparrows and Mosquitos.

A highly respectable gentleman of New York, well known in this city, having noticed our recent allusion to the great increase of mosquitos in Boston, writes us a private note on the subject. He says that for three years past these pests have been diminishing in New York city. He had been in the city day and night during June and July just past, and had not yet seen one mosquito, nor heard but two or three during the night watches. He attributes this change to the active services of the English sparrow, which have recently been introduced in that city. Four years ago, twenty pairs were imported, and provision was made for their accommodation. Now it is estimated that there are five thousand pair in the New York park and gardens; and their active and industrious habits are believed to have materially diminished the swarms of mosquitos which have heretofore made New York a byword and a hissing among all light sleepers who have sensitive skins. This theory is strengthened by the fact that the same experience has marked the introduction of the sparrows into Jersey City—the mosquitos have greatly diminished there even, which is mosquito land itself.

If there is anything in this—if the English sparrow does actually wage war on mosquitos, as on measuring worms and caterpillars, and other insect nuisances, which threatened at one time to compel the removal of shade trees from all our cities and towns—then we go for importing one thousand or five thousand pairs at once, to be domesticated in Boston and immediate neighborhood, as a matter of more importance to the peace and comfort of our citizens than would be the addition of one hundred extra policemen.—*Boston Traveler.*

Fastening Loose Window-sashes.—The most convenient way to prevent loose window-sashes from rattling when the wind blows, is to make four one-sided buttons of wood, and screw them to the stopes which are nailed to the facecasiugs of the window, making each button of proper length to press the side of the sash outwards when the end of the button is turned down horizontally. The buttons operate like a cam. By having them of the correct length to crowd the sash outwards, the sash will not only be held so firmly that it cannot rattle, but the crack which admitted dust and cold air will be closed so tightly that no window-stripa will be required. The buttons should be placed about half-way from the upper to the lower end of each stile of the sashes.

Canal Boat Propulsion.—Dr. R. Hunter, of Cleveland, Ohio, haa invented a method of propelling canal boats by means of an india-rubber plate attached to the stern of the boat and actuated by steam in the manner of a fish's tail.

Mechanical Hints.

Best Time for Painting Houses.—*Technologist* says: The best time for painting the exterior of buildings is late in the autumn or during the winter. Paint then applied will endure twice as long as when applied in early summer or in hot weather. In the former it dries slowly and becomes very hard, like a glazed surface, not easily affected afterwards by the weather or the beating of storms. But in very hot weather the oil in the paint soaks in the wood at once, as in a sponge, leaving the lead nearly dry and nearly ready to crumble off. This last difficulty, however, might in a measure be guarded against though at an increased expense, by first going over the surface with raw oil. By painting in cold weather, one annoyance might be escaped, namely, the collection of small flies on the fresh paint.

Oil for Harnesses.—Harnesses, it is said, may be rendered impervious to water by thoroughly impregnating them with a mixture made in the proportion of twenty-one gallons of pure whale-oil and fifteen to seventeen pounds of india rubber shreds. Heat these ingredients together at a temperature of from 194° to 240°, which will insure the dissolution of the rubber.

Another.—Alcohol, 1 gallon, white turpentine, 1½ lbs., gum shellac, 1½ lbs., Venice turpentine, 1 gill. Let them stand by the stove until the gums are dissolved, then add sweet oil, 1 gill, and color, if you wish it, with lamp-black, 2 oz. This will not crack like the old varnish.

Elastic Varnish for Leather.—Take two parts by weight of resin, and one of india rubber, and heat them in an earthenware vessel till they are fused together; after which they should be stirred till they are quite cold; a little boiled linseed oil may be added while the materials are hot.

To Improve Gilding.—Mix a gill of water with two ounces of purified nitre, one ounce of alum, one ounce of common salt; lay this over gilt articles with a brush, and the color will be much improved.

Any hard, steel tool, will cut glass with great facility when kept freely wet with camphor dissolved in turpentine. The ragged edges of glass vessels may also be thus easily smoothed by a flat file.

Cleaning Brass.—One of the best liquids to clean old brass is a solution of oxalic acid.

Good Health.

More About Tight Shoes.

Poor, little, pinched, tired feet! How my heart ached for them, as I saw them encased in snug, trim, buttoned boots! They were on the feet of a little girl, four or five years of age. The "night train" had just reached its destination, and early morning found us very tired and sleepy as we stepped to the platform and hurried on our way.

The child had evidently worn those new, tight boots all night, and was now so stiff and lame that each step was a distortion of her dear little feet and ankles. How she must have suffered during the long, long hours of that night of travel! I could but contrast her appearance with that of a little boy by my side, whose shoes were old, and easy, and comfortable. I knew that he had enjoyed a nice night's sleep, with day clothing laid aside, and robed in his night dress as at home. Now he was bright and fresh, and well fitted for the day of travel before him, while the other little one was just the reverse. I thought: "When will parents learn common sense, and dress their children for comfort!" All day long, as I journied on, and many times since, have I seen, in imagination, the poor, little, pinched feet, as I saw them on that morning.

Tight shoes—what misery they give! Who of us has not worn them, and suffered in them, and felt as though we could not endure them a moment longer? How our tempers have been turned, and peevish or angry retorts given, all on account of tight shoes! Away with tight shoes, both for ourselves and all under our care! They are a deadly foe to comfort and happiness.

Let us also be charitable to the failings and faults of others; for if not caused by tight shoes on the feet, they may be pinched somewhere, either in body or mind. There are aches and pains, secret trials and disappointments, that may be called the tight shoes of the soul; and how often we wear them perversely, suffering anguish when we have only to throw off the bondage, the desire for conventional trimness of effect, and, shod appropriately and sensibly, step forth cheerily on our way.—*Hearth and Home.*

Morbid Sorrow.

Too often it is the case that men remember their sorrow, and do not register their joy. But even under afflictions, if men did but know it, there are musical tones which might strike through the requiem's wail. There are lights that might illumine the dark, Rembrandtian sorrows. Men fall into a mania. Sorrow takes on a diseased form. It becomes morbid. It whets and stimulates itself. It ferments. It overflows. It tinges the whole mind from top to bottom with its color. As just after a drenching rain every twig on the tree is fringed with the drops, and every leaf weeps; and, as when some gust of wind strikes it the tree rains again, as if it were a cloud; so, when sad experience comes upon us, we are apt to be remorseless with ourselves, and to work upon our own susceptibilities. We do not put hope over against despair, and cheer over against gloom. Therefore much of the suffering which men have in life, much of the gloom which they are under, results from the not using of themselves wisely. I see in many who come to me a morbid taste for suffering. It is a hideous form of excitement. Persons at last even come to a state in which they want to suffer—or rather, want to be thought to suffer. They want to reap in the fields of sympathy this abnormal and, what seems to me, hideous praise of seeming to suffer. Sometimes no greater offense can be given than to compliment persons on their health, and happiness, and prosperity. For they are martyrs, and they walk under a cape of sadness; and not to recognize that, is to deny them the chief pleasure almost of their life. To be miserable is their joy!—*Beecher.*

Reported Cure of Hydrophobia.—In the newspapers appears the statement of a case of hydrophobia which occurred at or near Detroit, and which was treated successfully by the following means: One grain sulph. morph. was injected hypodermically every four hours, and 30 grains castor given at the same intervals. Small quantities of chloroform were also inhaled. Sleep was produced in half an hour, lasting an hour and a half, and finally the convulsions ceased. The patient was wrapped in a woolen blanket wrung out of a warm solution of muriate of ammonia, 20 grains to the ounce; but this was not done till the symptoms began to yield. There was nothing very novel in this treatment, especially as to the morphia and chloroform, which were doubtless the efficient agents, admitting the case to be correctly stated. The castor and the warm fomentation may have aided slightly. But the patient is described as "barking like a dog," seizing the pillows in his teeth and shaking them like a ferocious dog, etc. This part of the story does not add to its credibility. It is matter of surprise that newspapers conducted by intelligent men will from time to time give currency to such statements, whilst physicians everywhere have declared against them as popular errors. Probably one-half the civilized world still believe that men with hydrophobia act the part of rabid dogs, and are frequently relieved from suffering, through professional authority, by pressure between feather beds.—*American Chemist.*

What to Do in Emergencies.—If a person falls in a fit, and begins to snore loudly, with a very red face, it is apoplexy. Let him be seated so as to favor the blood going downwards, from the head; apply cold cloths to the head, or cushions to equal quantities of snow or pounded ice and common salt. If the person is perfectly still, face pale, and there is no perceptible breathing, it is a fit of fainting. Do not touch him, except to loosen the clothing; then keep off five or ten feet distant, so as to allow the air to come in; make no noise, and there will soon be a calm, quiet return to consciousness and life, for it is only a momentary cessation of the circulation of the blood to the head. But suppose there is a very violent motion of the hands and feet, and are all sorts of bodily contortions, it is epilepsy. Let the man contort until he is tired; you can't hold him still; all your efforts only tend to aggravate the trouble and exhaust the strength; all that ought to be done is to keep the unfortunate from hurting himself. There is no felt suffering, for as soon as he comes to he will tell you that he remembers nothing whatever of what has passed, appears to be the only calm and self-possessed person in the whole crowd, and is apparently as perfectly well as before the occurrence. Dizziness often comes instantaneously, and we begin to reel before we know it. Shut the eyes, whether you are walking along the street, looking over a precipice, ascending a ladder, or climbing to a ship's mast head; the fear of dizziness disappears instantly if you look upwards.—*Hall's Journal of Health.*

Antidote to Phosphorous.—It is well known that many metallic salts, such as acetate of lead, sulphate of copper, salts of mercury, bismuth, etc., are withdrawn from their aqueous solutions by vegetable charcoal, but to a still greater exteut hy mineral black. Carbon also absorbs many alkaloids from their solutions, and it is upon this property that the process is based for the detection of strychnine in beer by its means. MM. Eulenberg and Vohl now show that phosphorous is also absorbed by carbon, and to such an extent that carbon taken in the form of pills constitutes a complete antidote to the poisou, and relieves those who have to manipulate phosphorous from all the disastrous consequences hitherto accruiug. The experiments they have made upon animals have yielded exceedingly favorable results. They prepare the auimal charcoal pills by powdering the charcoal and making it up with a little gum. In match-factories they find the results of these pills are better than those obtained hy the use of the essence of terebinthine of M. Personne, as the continued use of the latter was found to produce violent headaches.—*Am. Artisan.*

California Boarn of Health.—Dr. Logan in his last monthly health report, says:—The State continues in the possession of the high sanitary condition that has ruled for some time past. Pneumonia and catarrhal affections have prevailed pretty generally, but of a mild form; also, rheumatism. Several well marked cases of scarlatina have been observed in differennt points. Small-pox still continues by frequent importations from other places, but owing to the prompt measures adopted in isolating the cases as soon as discovered, it has not spread. There is now one case in Sacramento, which is quarantined in a tent some two miles from the city. Vaccination has been so general as, probably, to render it impossible for this disease to prevail to any extent during the approaching dry season.

Exercise.—The amount of daily exercise necessary for health depends upon the kind of exercise, and varies considerably with different persons and with the same person at different times. A safe rule to go by is to exercise until slightly fatigued. It should not be continued so long that half an hour of perfect rest will not entirely remove all feeling of fatigue. Special exercise for retaining health should not as a general rule be taken less than two or three hours after a meal, except it may be some slight exercise, as moderate walking, riding, etc. A person should always be thoroughly rested after exercise, before eating; perhaps the very best time of day for taking exercise is from 10 to 12 o'clock in the forenoon, although the time may be varied to suit the person's convenience.—*Herald of Health.*

To Cure the Love of Ardent Spirits.—Captain Hall was the commander of the Great Eastern steamship. He had fallen into such habitual drunkenness that his most earnest efforts to reclaim himself proved unavailing. At length he sought the advice of an ancient physician, who gave him a prescription which he followed faithfully for seven months. At the end of that time he had lost all desire for liquor, although he had many times been led captive by a most debasing appetite. The prescription, which he afterwards published, and by which so many other drunkards have been assisted to reform, is as follows: Sulphate of iron, 5 grains; magnesia, 10 grains; peppermint water, 11 drachms; spirit of nutmeg, 1 drachm; twice a day.

To Relieve Frosten Feet.—To relieve the intense itching of frosted feet, dissolve a lump of alum in a little water and bathe the part with it, warming it before the fire. One or two applications is sure to give relief.

Whooping cough is now cured by *compressed air.* Dr. Sardahl, of Stockholm, reports 102 cases rapidly cured by this treatment.—*Medical Journal.*

Gold and Legal Tender Rates.

SAN FRANCISCO, Wednesday, April 17, 1872.—Legal Tenders buying, 91¼; selling, 91¾. Gold in New York to-day, 110⅞.

Table of Contents.

EDITORIALS—Honors to Prof. Morse; Gold on the Northern Coast, 241. Animal Power, 246. The Scarcity of Iron; New Mode of Prospecting Mines; English Capital in Our Gravel Mines, 248. Geological Survey; Infringement of Patents, 249. The Best Zinc for Galvanic Batteries; Bridges; Sales; Discoveries, 252.

ILLUSTRATIONS.—Device for Telegraphing Both Ways, Simultaneously, on a Single Wire, 241. Sequoia Gigantea, 246. Dewey's Patent Can Opener; Spiral Spring Pencil Sharpener, 249.

CORRESPONDENCE.—Notes of Travel from Placer County, Continued, 242.

MECHANICAL PROGRESS.—Utilization of Tin-plate Clippings (Tinners' Waste); The Production of Bright or Lustrous Colors of Metals; Glass Bearings, 243.

SCIENTIFIC PROGRESS.—The Spectroscope of the Nebular Hypothesis; Velocity of Meteoric Stones; Eruption of Meteorites from the Sun; The Transit of Venus; Dangerous Gas Pipes, 243.

MINING SUMMARY.—Reports from Mines in various States, Counties and Districts; Stock Reports; Leather and Metal Markets; Mining Shareholders' Directory, 245.

USEFUL INFORMATION.—The Nature of Different Resins; Experiments about Heat; Sparrows and Musquitos; MECHANICAL HINTS.—Best Time for Painting Houses; Oil for Harnesses; Elastic Varnish for Leather, 247.

GOOD HEALTH.—More About Tight Shoes; Morbid Sorrow; Reported Cure of Hydrophobia; What to Do in Emergencies; Antidote to Phosphorous; To Cure the Love of Ardent Spirits, 247.

DOMESTIC ECONOMY.—Poor Housekeepers Make Poor Servants; How to Cover a Comfortable; How to Carve; Taking Boiled Potatoes Out of the Kettle; Vinegar from Unripe Fruit; Cucumber Salad; Summer Beverages, 251.

MISCELLANEOUS.—Mining Matters in Utah, 242. Steam Communication and Engine Power for Isolated Mines; Gould and Curry Improvements; Legends of the Yellowstone; California Pears in Europe, 246. Patents and Inventions, 249. New Incorporations, 252.

Notices to Correspondents.

R. T. writes to us to know whether, in working with a hydraulic with a given fall or pressure, increasing the size of the pipe in which the water is conducted to the nozzle, will increase the force or power of the stream?

If the orifice at which the water enters the pipe remains the same, and also the head or pressure, and size of nozzle, increasing the size of the pipe would make no material difference. That is if your pipe is now of sufficient capacity to carry freely the number of inches you require. If it is not, of course increase it until it will. When you arrive at that point no further enlargement would be any benefit, except that it might decrease the friction in a very slight degree.

The same correspondent wants to know whether carbolic acid is ever applied as a medicine either externally or internally.

It is used externally in cases of bad sores, ulcerations, etc., principally for its antiseptic properties. Sometimes applied internally, but not often. Its uses are as yet little known, and experiments are being continually made with it. When used as a medicine it is generally diluted freely with water.

L. B.—The specimen of ore sent, is micaceous iron.

MR. A. B. PAUL has just finished at the Miners' Foundry, one of his electric chemical, dry amalgamating mills for the Calaveras Mining Co., at Murphy's Camp, Calaveras County. The mill is a very complete affair of six tons capacity.

STOCKS.—By reference to our Stock Exchange report the general activity and rise in price in mining stocks may be seen.

The Scarcity of Iron.

American skill and inventive faculty is constantly applying iron to so many new uses, and our increasing manufacturing prosperity in all the different branches connected with the railroad, foundry and rolling mill interests, causes the present scarcity and consequent rise in value of iron to be much felt. All kinds of iron are reported at very high and steadily increasing prices, with great scarcity. To make the matter worse, as far as any immediate reduction in price is concerned, the demand for iron is very great and increasing wonderfully. There is an extraordinary activity in railroad building, not only in the United States, but in Europe and elsewhere, and the necessity for iron in the manufacture of agricultural implements, engines, iron cars, iron steamships, and the ordinary arts is greater than it ever has been before.

Many reasons for this advance in prices are given. By some it is contended that at the close of last year, all the stock had been nearly worked up by mills using large quantities and they did not wish to purchase ahead until their books told them how well they had done. As soon as they saw the figures were profitable they all wanted to buy at once, which naturally caused the market to rise. Others say that it was through the unprecedented demand for railroad material, caused by the unusual amount of road in process of construction or projected. Again, it is held that the advance is due to the uncertainty as to the action of Congress on the tariff question; for by a reduction of the tariff, trade would be so affected that many furnaces would stop, which cause prodnces to curtail the capacity of their works, rather than increase them, as later developments prove they should have done. Then it is said that it is owing to the greatly increased demand in manufacturing establishments—foundries, mills, etc.—and the progress in this country of making iron building material, iron and steel bridges, mining machinery, stairways, elevators, car wheels, rails, gas and water pipes, stoves and furnaces, iron ships, farm implements, arms, cars, and the numberless little articles for domestic use, tools, etc., all of which helps to exhaust the supply, since they need a large quantity of iron in their manufacture. The labor question in Europe and the uncertainty as to increase of supply, together with the rapid consumption has also been considered.

It is most probable that all of these reasons have a bearing on the question and perhaps it is more likely that they have all exerted their influence, rather than any special cause. However, it is certain that a number of enterprises are suffering from the effect, whatever the cause. Railroad men who commenced the construction of roads a few months since, find their prospective calculations sadly altered by this unexpected rise in iron, and besides having to pay from $10 to $15 more a ton than they expected, may consider themselves in luck if they can procure what they absolutely need and pay cash in the bargain.

The European market is very close and it is impossible to get more than small quantities at a time and then only by paying cash, contrary to the usual custom. The state of the markets has induced skilled laborers, who knew their importance, to keep constantly striking for higher wages, and their efforts have been aided by the coal miners, whose actions have caused English coal to go up higher than ever before, which also exerts a great influence on the iron product of that country. Pig iron has been contracted for by large consumers, in some cases a year and a year and a half ahead, and other parties not so fortunate or farsighted are compelled to run on "short rations."

When this scarcity began to be felt slightly, about a year ago, it was supposed that it would only be temporary, and most iron producers were cautious about increasing their facilities for fear of depressing the market by producing more than the necessities of manufacture called for, and thereby rendering the business improfitable by lowering the prices. The iron-producing regions of the United States have not been able to do as much as they might have done, on account of the scarcity of fuel, caused by the different coal miner's strikes, and many companies have not been able to keep pace with the demand.

Although the foreign article does not exert the influence in our markets that it did when the English had an exclusive monopoly, it nevertheless affects us seriously since the American production is not equal to the demand; nor, in fact, is that of both countries combined just at present.

The progress made in the past few years since the war, by the United States, in the magnitude, scope, and variety of manufactures is such as was never anticipated, even by the most sanguine persons. Our railroad interests are enormous, and we are just turning our attention to the resuscitation of our commercial marine which the necessities of the age require shall be of iron. Not only new railroads are being built, but the extent of lines already constructed which need daily repair in the matter of rails, wheels, etc., would call for a large quantity of iron. Our population is steadily increasing, and the class of emigrants coming to our shores and engaging in agricultural pursuits causes an increasing demand for farming implements, which also consume quantities of iron. We are beginning to ship machinery of this and other classes to China and Japan, and the prospects are that that trade will take a great deal of iron out of the country which would otherwise be used at home. The importance of the mining interests of this coast, to which so much attention is being turned, is bringing capital here, and with it the necessity for mills, machinery, etc., of enlarged capacity and strength, and the iron interests in our part of the country need more of a supply than heretofore.

Iron is the greatest necessity of modern civilization; it is impossible to do without it. If the supply were entirely cut off for a year hundreds of thousands of men would be thrown out of employment, and business of all kinds hurt more or less. We could not advance, and would be compelled in many cases to have recourse to the rude tools of the ancients to perform the necessary labors of the day. Its application is so universal, so wide, that the mind fails to conceive the probabilities of such an occurrence. The world must have iron, and have it in abundance; and with increased production comes an increase of uses. It is to be hoped that the iron producers of the world will use their most strenuous efforts to accelerate the production of their mines and furnaces, and not take advantage of the present scarcity to keep up prices and discourage manufactures.

THE COLORADO MINES.—The new placer diggings on the Colorado river are said to be creating quite an excitement and a number of enthusiasts are about to wend their way thither. People are leaving Schellburn, White Pine, Pioche and other points in the old mining districts, to try their luck in the new placers. Since the information as to their extent and richness is very meagre, everybody wants to know about them, and we should advise all who want to change their abode to wait until something definite is learned and not risk their money and time in running after another "excitement," which may amount to nothing. If the country is rich, there is time enough for all to go, and if it is not, nobody wants to go. A certain class of men, on this Coast, however, are always waiting for some new district, and rush there on general principles, without regard to weather, time, or any other consideration, and to them advice is thrown away. Sensible men will wait developments and reliable information.

New Mode of Prospecting Mines.

The Virginia *Enterprise* mentions a new mode of prospecting, recently adopted in the lower levels of some of the principal mines on the Comstock lode, in which it is desired to keep the condition of the ledge from the knowledge of the workmen. Heretofore it has been customary to run a drift along the vein, and cross-cut at intervals for the purpose of examination. Of course, with this plan, every one gaining admission to the cross-cuts could tell exactly how the vein looked, which did not suit the managers, who desire to have earlier information than the rest of mankind. So they have adopted the device of running a drift in the country rock, parallel to the vein and boring from thence into the ledge at intervals to determine its character and value.

By the boring-in plan the miners see nothing but the borings that come out, and cannot tell whether they are in paying or barren rock; but by frequent assays, the Superintendents know exactly what they are about. It has leaked out, that one or two leading mines in Gold Hill, and the same number at Virginia City have thus been pretty effectually ganged for long distances on from one to three levels. While outsiders have been wondering at the great amount of time consumed in running long drifts parallel to the lead in the mines of several companies, and while they have been asking themselves why no cross-cuts were made, the Superintendents have been quietly boring into and feeling their way along the vein.

This new mode of prospecting a mine is certainly ingenious; but how the stockholders, outside of the "ring," who are taxed to pay the cost of such expensive prospecting, and who have a right to know the exact condition of the mine will like the plan remains to be seen. It is said that the recent astonishing rise in stocks along the Comstock is entirely due to the result of assays of borings secured for the exclusive benefit of the "rings."

ENGLISH CAPITAL IN OUR GRAVEL MINES.—The North America drift gravel claims, at Hepeedam (Whisky Diggings), Sierra county, containing 450 acres, have been sold recently in the London market to the "North America Gold Mining Company," (limited) for $400,000, including $50,000 working capital. The purchase embraces the three groupes of claims known as the North America, Niagara and Vermont, lying contignous in the ridge dividing the counties of Sierra and Plumas. They are well opened, and proven to be propertiee of great value. D. W. C. Morgan, a former resident and mine owner in Sierra, took possession for the new company about one month since, and is making improvements, with the view of employing 100 or 200 men another year—65 men are now engaged, and as many more will be put on in a month or two. These mines are now working profitably, and it is predicted they will prove the most extensive and remunerative of any in this section.

We congratulate our English friends on the acquisition of this property, and feel certain that under the management, the returns will be fully up to their most sanguine expectations.

RICH SPECIMENS.—Some beautiful specimens of gold quartz from a mine in El Dorado county, have been on exhibition at the Quincy Hall Clothing Store, in this city, during the week.

They were selected from a ton of very rich rock, which was taken out at a single blast, and are said to be valued at $7,000. A single specimen from the same mine was shown here some two or three months since, which was valued at nearly $10,000.

The ledge from which it is taken is said to abound in "pockets," and judging from the appearences of the pieces in question the owners are very fortunate individuals.

Patent Can-Opener.

Tho variety of canned fruits, meats, fish and vegetahles consumed hy the civilized world is constantly increasing, while the amonnt annually conenmed is already mnch greater than is generally snpposed. Tho cheapest receptacles for putting up snoh preserves aro tin cans tightly soldered, and consequently the hulk of onr canned goods are so sealed. To furnish the best implement, at a moderato cost, for opening these cans, has called into requisition mnch inventive ingenuity, and various dovices havo boon patented, some of which seom to answer tolerahly well the purposos for which they wore intended.

To produce the host can-openor, in all respects, however, seems to havo beon left to a California artisan, who patented the one hore represented in 1870. It cuts either a ciroular opening or a square ono, as may he desired. To make a round cut, as in openiug an oyster can, the roundod point is thrnst downward through the top, and the handlo lowered so as to bring the circular cutting knife, (which slides on the bar, in ordor to regulate the size of tho opening,) down to the surface of the can, when with a slight pressure its point will enter the can, and when the handle is drawn around, the cut is easily

made. To make a square opouing, as for instance in a sardine box, the instrnment is inverted, and the straight cutting knife at tho point is inserted, instead of the ronnded point, when by an up and downward movement of the handle, acting as a lever, a straightforward inoision is made. The flat spring over the har holds the sliding knife in place. It is a simple, easily handled instrument, comparatively indispensable for family use, and especially serviceahle to hotels, restaurants, ships, etc. Tinners and saddlers also find them quite useful in their trades. Eugene F. Dewey, formerly of San Francisco, is the inventor. Weister & Co., patent salesmen, No. 17 New Montgomery street, are general agents for the Pacifie States, and can be addressed for agencies. For information to distant readers we will mention that samples are sent, post paid, for 75 cents, in currency or postage stamps.

Utah Mines.—The mines in Little Cottonwood are doing splendidly, snd the Emma, Flagstaff, Wellington, Davenport, Montezuma, Lexington and Savage have a large amount of ore on hand ready for shipment as soon as the weather will permit. A number of snow slides have occurred in the canon, recently, resulting in loss of life and injury.

The heavy storms have caused snch an accumulation of snow that great fears are entertained of futnre slides, and preparations have heen made to prevent accidents as far as possible. A numher of capitalists and experts are in readiness to make examination of several mines as soon as the weather will permit them to leave Salt Lake City. Samples of gold quartz have heen brought to that place from Little Cottonwood, which look well.

Pacific Coast Mercantile Director.—This is the name of a new publication, several specimen pages of which have been laid upon our table and which will be issued at an early day. This paper hae been started mainly through the instrumentality of Mr. William H. Murray, business manager, who has been for several years a travelling correspondent of this journal, and to meet a primary want which he found to exist for a medium of communication between the merchants of the interior and the wholesale dealers of this city. Each number of the paper will comprise from 16 to 32 pages, according to the demands for advertising space, and will be furnished regularly to interior merchants, bookkeepers, etc., at the rate of $1 for 12 months. We presume the paper will be issued mouthly. Among its contributors are such men as Prof. E. S. Carr, of the State University, R. G. Sneath, etc., while quite a number of our leading business men have allowed the use of their names as promotere and encouragers of the enterpriee. We understand that the advertieing columus of the first number are fast filling up.

The Spiral Spring Pencil Sharpener.

The aocompanying illustration represents a neat device for sharponing lead pencils so as to make a fine point, without having to soil the fingers in so doing. It is made in two parts, the guide, which is placed upon the pencil, and a oircular cntter raised upon a wooden stand. The stand is made bowl-shaped so as to collect the lead and shavings. The guide consists of a tube having a revolving spring within it, whioh clasps the pencil, allows it to tnrn inside the tnbe and at the same time prevents its slipping. One surfaco is beveled, so that part of the pencil may project sufficiently to bo subjected to the cutter, and by being tnrned by the hand. preseut a different surface to the cutter, until it tapers to a fine point.

The disk or outter is a fixtnre upon the wood, but the metal cap which covers it is movahle. Upon the oap is a rest, called the guard, into which the guide is placed. A portion of the blade, or cutter, is exposed by the cap being cut away. The

BURGESS' SPIRAL SPRING PENCIL SHARPENER.

guide is worked back and forth over the cutter, so presenting the pencil to be cut off until the point is made. The cutter is of fine saw steel and has a very sharp edge. When that part of the blade in use becomes dull, by moving the cap slightly a new edge is presented, which may be repeated until the whole circumference of the cntter has become dulled. It is then only necessary to take out the screw, remove and sharpen the blade, and replace it.

This device is intended for Fabers' pencils principally, but will sharpen any which will enter the spring. It will be found useful in banks, counting-houses, sohools, families, etc., and especially convenient for ladies whose pencils are proverhially hlunt, and whose pen-knives are seldom sharp; moreover it will not soil the fingers. The principal parts of this invention have heen patented, and the patent covering the remainder is pending. Huhert Burgess is patentee, and J. Stott, 1,002 Market street, is agent.

Selling Milk.—Some German papers are urging that milk be sold, like spirits, according to the percentage of the valuable constituent. Both sellers and purchasers of spirits are satisfied with this method, as would be also both sellers and purchasers of milk. The advantages are manifest, so much so that one editor thinks it necessary to allude to one only,—that there would then be "no necessity among dairymen of raising milk-water-giving cows and of making the cattle sick."

Coal.—During the month of March 15,200 tons of coal were shipped from the Pittshnrg Coal Company and the Black Diamond Coal Company's mines at Mount Diablo, Contra Costa Co.

Geological Survey.

The members of the Geological Survey are all busy pursuing the various duties allotted to them by Professor Whitney, and it will not he long before the State maps aro completed. We spoke a short time since of the map of the Plioceno rivers, which, when finished, will he particularly interesting as showing the localities of the deep gravel deposits of the State. The geological map of the State is in the engraver's hands; a large portion of it is finished. The rocks of the whole State have been geologically located. One of the interesting features of this map is the colored portion showing the direction and location of the auriferous slate rock, chiefly of Jurassic age, which runs out to the ocean near Oregon, inclnding the auriferous gravel hasins of the Klamath and Trinity rivers. Some of these same slates are now on the top of Mt. Dana.

Another interesting point is that it distinctly shows the regnlarity with which one formation followed the othor in a sort of land-making process toward the west. It is very practically shown and applicable in connection with the Pliocene rivers, the formations corresponding to which are traceable all over State, in the valleys far removed from the Sierras. This map is to be properly colored to represent the different geological formations and as soon as the different plates are made the map will be issued. The Pliocene river map is a distinct and separate publication. Another edifying feature is that which shows the distribution of the lavas of the State, where the activity of volcanic action existed and where it thinned out.

Prof. Whitney will leave this week with a party for the region of the late earthqnake. He intends investigating the phenomena connected with this great convulsion of Nature and the effects produced on the conntry surrounding what is supposed to have heen its central or starting point. The results of these observations will douhtless be of great public interest and we anticipate with pleasure the pernsal of the data which the Professor will collect. He hus made the stndy of the subject of earthquakes a specialty, and his investigations will be of a strictly scientific nature. His familiarity with the geology and physical geography of the State peculiarly fit him for the task he has undertaken and his statements may be looked on as reliable and valuable.

Railroad District.—The Highland Silver Mining Co. are enid to have etruck a fine body of rich ore in the Humboldt mine in Railroad District, Nevada. The Elko mine has also developed a good body of ore. The mines are all looking well but there is still plenty of snow to contend with.

Patents & Inventions.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports to Dewey & Co., U. S. and Foreign Patent Agents, and Publishers of the Scientific Press.]

For the Week Ending March 26th, 1872.

Grain Separator.—Garland A. Dabney, San Jose, Cal

Valve for Water Closets.—William Smith, S. F., Cal.

For the Week Ending April 2d.

Process and Apparatus for the Manufacture of Sulphate of Lead.—H. Augustus Whiting, S. F., Cal.

Machine for Clarifying, Mixing and Bleaching Lard.—Oscar J. Backus, S. F., Cal.

Manufacture of Hose and Tubing for Water, Steam and Other Fluids.—Sydney P. Cook, S. F., Cal.

Stamping and Hammering Machine.—George D. Crocker, Virginia City, Nev.

Grape Crusher and Stemmer.—George Johnston, Sacramento, and William F. Johnson, Folsom, Cal.

Device for Propelling Canal Boats.—Thomas K. McDonell, S. F., Cal.

Clothes Dryer.—Anson C. Stowo, San Jose, Cal.

Compound Implement.—John C. Schlarbaum, San Jose, Cal.

For the Week Ending April 9th.

Apparatus for Obtaining Mercury from its Ores.—Henry Johnson, San Francisco, Cal.

Shoe-Fastening.—Aaron Lawson, Petaluma, Cal.

Wood Pavement.—Henry M. Stow, San Francisco, Cal.

Wood Pavement.—Henry M. Stow, San Francisco, Cal.

Preparing Blocks for Wood Pavement.—Henry M. Stow, San Francisco, Cal.

Propeller-Wheel.—Rasmas Johnson, San Francisco, Cal.

Machine for Making Concrete Pipes.—George I. Eagan, San Francisco, Cal.

Artificial Stone.—George L. Eagan, San Francisco, Cal., assignor to himself and W. H. Van Doran, Springfield, Ill.

Furnace for Smelting Ores.—Theophilus L. R. Scheuner, Salt Lake City, Utah Ter.; antedated April 3, 1872.

Infringements of Patents.

A snit has been recently instituted by Frank O. Fisher, against R. B. Craig and Joseph Craig for alleged infringement of patent of the "Hydraulic Chief" nozzle. The plaintiff claims that he has with the knowledge of the defendants heen manufacturing and selling the said apparatus, and that notwithstanding this the defendants, contrary to his will, commenced to sell the improvement in October, 1871, and have continued to do so up to the present time. The patent, which is well known, consists of a swivel-jointed nozzle and pipe combined so as to form a double movement; the nozzle proper having a perpendicular movement, while the swivel joint proper enables the entire apparatus to he tnrned by a horizontal movement, in any direction. Between the upper and lower elbow composing this joint is a space left for the insortion of packing hetween the flanges, in order to be freely turned on the elhow, and still form a water-tight joint. The plaintiff prays for damages to the amount of $5,000.

John L. Stevens and Geo. W. Stevens have entered suit against Geo. W. Swan and Oliver Hinckley.

Complainants state that they are the inventors of a new and useful improvement in cases for transporting eggs. It consists of a box or case, divided into compartments of such a size as to hold one egg each, the box of any depth, placing a separate diaphragm horizontally hetween each tier from the bottom to the top. Complainants further show that in an action at law against Henry Cohn and Charles Martin, in October last, for a violation of the exclusive privilege secured to the plaintiffs, the jury of the United States Circuit Court returned a verdict of guilty, and awarded damages in the sum of one dollar. The defendant herein—Swan & Co.—have manufactured and sold these boxes since February, 1867, and that without the consent of the owners of the patent. Plaintiffs pray that the defendants may be compelled to make a showing of their business in the shape of egg-hox manufacture, and that they may he decreed to account for, and to pay over to them all the gains and profits which may have accrued to defendants from usiug, making and vending said impr ovement.

The excitement created hy the discovery of placer diggings in Lake county has ahated.

Domestic Economy.

Poor Housekeepers Make Poor Servants.

"We have sold our honse aud gone to boarding, and I am once more at rest." Thie was said by a lady who had had a beautiful home, and a eufficient income to live delightfully, *if* she had only known how.

"I have heen tormented to death with poor servants," eaid she, "and do not believe there ie such a thing as a good cook to he found in all New York. I am tired enough of this country, and should like to go hack to Paris, where we cau live delightfully, and with so little trouble."

Ah! the trouble is not all with the servauts, thought I. Ladies must know somethiug of household matters themselves. A cook comes to you well recommended; but, perhaps, in her last place the lady *preferred* bakers' bread to home-made; never cared for a nice, wholesome soup, with the dinner, and chose to send to the bakers for her pies, rather than have them made in the house. Let your cook he ever so good, she must be in constant practice, else ehe will be liable to make some very annoying failures, if only at intervals of ten days, or a fortnight, she may be called upon to make an extra effort.

Then again, ladiee do not cousider how tastes vary in differeut families. A dish that is highly esteemed in one is utterly distasteful in another; and what to the cook and servants in the kitchen, may seem delicious, will not satisfy the more cultivated palate above etairs.

What ladies most need in housekeeping is patience and intelligent forhearance. Let a lady have discrimination enough to judge whether her servants, even if they have not her ways of doing their work, may not have the elements of good servants in them, and then let her know enough *herself* to instruct them into her own ideas of labor, and she may not only have good servants, but be able to keep them eo.

Not every one realizes how much careful marketing has to do toward a well cooked meal. If the marketing is left to the servants, the servants leave it to the butcher, or grocer, aud the best cook may work hard and intelligently and yet come far short of the succees she might have attained, had good material been put iuto her hands.

Then the family often complain that their dinner is badly cooked, or unsatisfactory, for no earthly reason, save that the head of the house doee not understand how to carve, and help to the best pieces.

An old eervant once told me how, week after week, the roast beef would be sent down from the table, with the tenderloin all left for the servants, the gentleman, meanwhile, complainiug daily, that they always had tough heef, simply hecause he did not know enough to turn over his piece of beef, and help himself to a tender elice.

A lady once complained, at dinner, that her fish was always soft, and never came to the table looking as it ought; and yet I could discover, at once, that the fish had been kept almost to a spoiled condition, and kuow that her cook had not suitahle utensils to cook it in, so as to give her a chance to bring it, neatly, to the tahle.

Ah! ladies of New York, and of America generally, the fault is not wholly below stairs. *Educate yourselves.* Instead of writing long letters on what women are not *permitted* to do, learn, *first*, to do that which all allow, it is your duty to do. Understand fully your duty to your husbande, your children, and your servants, and having learned the lesson, *do it well.*

How to Cover a "Comfortable."

When the outsides of a comfortable or bed quilt have become tattered, if it is not so heavy that an extra covering will make it burdensome, it is a good plan to renew it in this fashion:

Firet, wash it as clean as possihle. If it dries somewhat streaky no matter; that it shall be thoroughly sweetened is the main object; and no amount of exposure to the air or heating with a stick will accomplish this in the case of an old, long-used comfortable. Trim off the tattere of the old covering, have the new in readiness—good dark calico is the best thing—and tack it on in the way log-cabin patch work is done. That is, holding the quilt upon your lap or on a tahle front of you, commencing at the nearest edge, folding the cloth hack toward you. Then baste or tack with strong thread the wrong side of the covering to the quilt, making the stitches short on the right eide, and as long upon the wrong side as you think consistent. Wheu you have gone the length of the quilt, go over another portion, say six or eight inches wide, and tack again. Just as you would make a block of log-cabin patch-work, only that the cloth is all in one piece instead of in strips, and no corners to be turned. Wheu one side is fiuished, do the other in the same way.

When this covering becomes soiled, it can be in five minutes ripped from the quilt for the wash, while if elahorately knotted or quilted the tack becomes quite formidable.—*Western Farmer.*

Recipe for Winter Mince Pie.—Oue pouud of ready made sausage, seasoned, one pound of zante currante, one pound of raisins, small pint of syrup, three-fourths of a cup of viuegar, spice to taste. Put on the stove and boil ten minutes. This quantity makes six pies and is very little tronble to put together.

How to Carve.

On page 187 of volume II. we gave au article under the above head from the pen of Mrs. Henry Ward Beecher, but the following, from *Hearth and Home*, contains something farther, which will he found of interest to every one who deeires to be ahle to carve well aud easily, and without awkwardness:

Carving is a very desirable accomplishment for hoth ladies aud gentlemen, and should be taught. Oue cannot learn it by tuition, hut by practice, joined by a small slice of theory. It is true the French style of eerving meat sliced is fast banishing the uecesity of carving at the tahle of the rich; hut in middle life, where such elegancies are not practiced, a knowledge of carviug should be a part of a boy's or girl's eduoatiou.

How often do we hear a person say: "Oh, excuse me, I can't carve; I never tried." Or, if it be attempted, one soon finds himself sadly embarrassed. He grasps the knife and fork desperately. He has learned that a slice of the hreast of the turkey is a dainty; that a wing is good; the second joint also; that the leg is not so good. But it is not an easy task to separate them; and he thinks he would rather chop wood than cut turkey. He doee not know that on the back lies a delicious morsel called the oyster, and the side bones below the second joint are considered titbits. This must be taught him.

Ladies ought especially to make carving a study; at their own homes the task ofteu devolves upon them, and they should he able to perform it with ease, and not be forced to accept the assistaoce of visitors, who would probably dread the operation. The platter should he placed so near the carver that he has full control over it; if far off nothing can prevent an ungraceful appearance. A sharp knife is reqnisite, and a thin and well tempered blade.

In carving turkey, cut off the wing nearest to you first; then the leg and eecond joint; then slice the breast uutil a rounded piece appears; insert the knife between them and separate them—this part is the nicest bit of the breast; next comes the "merry thought."

After this, turn over the bird a little, aud just helow the breast you will find the oyster, which you separate as you did the inner hreast. The side bone line beside the rump, and the desired moreel can be taken without separating the whole bone. Proceed the same with the other eide. The fork need not be removed during the whole process. An experienced carver will dissect a fowl as easily as you can break an egg or cut a potato. He retains his seat, manages his hands and elbowe artistically, and is perfectly at ease. There is no difficulty in the matter; it only requires knowledge and practice, and these should be taught in the family, each child taking his turu. Chickens and partridges are carved in the same way.

Taking Boiled Potatoes Out of the Kettle.

If there is one thing harder than another in preparing this indispensable article for the tahle it is taking a boiling hot kettle (covered or not) from the fire and pouring the water out slowly, which cannot be accomplished without nearly or quite scalding the hand which holds the kettle; consequently the open air is usually better than in a close, dark corner of the kitchen; and it is well known that every house is not provided with a drain.

Imagine this proces occupying at least four minutes in the cold or etifled air, eteam rieing and enveloping the whole form. One or two holders is requisite; then oftentimes the kettle, which is not of the best iron, is covered, replaced on the stove to stand from fifteen to thirty minutes, until the potatoes are saturated with rust or a taste of iron, and all in the bottom watery, having soaked up what it is impossihle to turn off, or burned or blackened, making it necessary to throw one-third of them away.

To do away with all these objectione have a long handle skimmer (which costs ten cents), and while the water is flopping place it on one side under all the potatoes it will hold at once and so on until all are removed into a convenient dish. The heat retained in the potatoes will make them perfectly dry and mealy while the steam is escapiug. They should he eaten before they are done smoking.

To mash or jam them, skim out as we have shown into a tin-pan; place the pan on a flat surface; then mash (not pound), which will not hurt the pan or the potatoes, season and stir with a spoon.

The kettle is easily removed to cool, or with oue stroke the boiling water may be turned into the slop pail. Try it.—*Ex.*

Rice Croquettes.—Take four ounces of rice and cook well in a pint of milk and the rind of half a lemon. Add more milk if needed to keep the rice covered. When done, mix with two tablespoonfuls of sugar, two ounces of butter, two tahlespoonfuls of milk, yolks of three eggs, a pinch of salt and nutmeg if agreeable. Put back on the fire and stir for a minute. Spread out ou a dish till cold. All this may be done the night before if wanted for breakfast. Then mix, shape, dip them in whites of eggs and bread crumhs and fry. You can cook the rice first place in water, by adding two tablespoonfuls of cream when ready to make croquettes of them.

To Keep Knives from Rusting.—Scour them on a board, crosswise, with some dry brick, after having wiped them perfectly dry; and put them away without wiping off the brick dust.

Vinegar from Unripe Fruit.

Unripe fruit, especially apples and pears, as are well known, is much used in the manufacture of vinegar; but the process usually adopted is defective in many important points. We give helow the substance of an article from *Granger's Manual of Vinegar Making*, which may, perhaps, serve a useful purpose. The principal fault of the old process consists in throwing away the pulp after the juicee are expressed. As this, however, contains a large percentage of starch, excellently adapted for conversion into vinegar, it is necessary to prepare the fruit so as to save this portion of ite substance. With this object it is to be grated, exactly as potatoes are prepared in the manufacture of starch, and the pulp passed through a moderately fine sieve, or through a coarse and open meshed cloth. There is thus nothing left behind hut pomace proper, or cellnloee, all the etarchy matter having been paeeed through the sieve with the juice. This is next to he diluted with water, in proportion to the quantity of starchy matter thus ohtained, and the whole is placed in a clean copper kettle, one or two per cent. of concentrated sulphuric acid being added, and heated long euough to transform the starch into grape sugar. The sulphuric acid is to he neutralized by means of carbouate of lime; the gypsum or sulphate of lime thus produced allowed to settle, aud the liquid is to he left for fermentation to take place, with or without the uee of yeast. A liquid having 8 to 10 per cent. of sugar can easily be made to have 4 or 5 per cent. of alcohol after fermentation, which, hy its suhsequent acidification, will yield a vinegar of 5 to 6 per cent. of acetic acid.

Cucumber Salad.—Mrs. S. J. H. writes: We have just prepared our winter's supply of cucumher salad, and this ie how we made it. There were about a dozen ripe "White Spine" cucumbere lying on their viues, and these we picked, washed, pared, cut into strips, taking out the seeds, and then to each dozen cucumhers—which we cut up into pieces like small dice—we put twelve large white onions, chopped, six large green peppers, also chopped one quarter pouud each of hlack and white mustard seed, and a gill of celery seed. These were all mixed together, a teacup of salt added, and they were then hung up in a cotton bag to drain, for twenty-four hours. Then the salad, with enough clear cold vinegar added to cover it, was put into stone jars and fastened nearly air-tight. In six weeks it will be fit for nse. We found this recipe in a old paper some years ago, and it has proved one of the nicest pickles we ever used. It looks as well as it tastee, so white and crisp, and makes an elegant salad for a joint of cold meat. It is not like the Spanish salad, that requires "a counselor for salt, a miser for vinegar, a spendthrift for oil, and a madman to stir it up," but it is quite as good in its way, and not very troublesome to make. —*Hearth and Home.*

Summer Beverages.

Apple Water.—Slice two large apples, put them into a jar, and pour over them one pint of boiling water. Cover cloee for an hour; pour off the fluid, and sweeten if necessary.

Apple Tea.—Roast eight fine apples in the oven, or hefore the fire; put them in a jug with two spoonfuls of sugar, and pour over them a quart of boiling water. Let it stand one hour near the fire.

Beverage of Figs and Apples.—Have two quarts of water hoiling; split six figs, and cut two apples into six or eight slices each; boil the whole together twenty minutes; pour the liquid into a basin to cool, and pase through a sieve when it is ready for use. The figs and apples may be drained for eating with a little boiled rice.

Cottage Cheese.—Boil two chickens till tender, take out all the bones, and chop the meat fine, seasou to yonr taste with salt, pepper and hutter, pour in enough of the liquid they were hoiled in to make it moist, put into whatever mold you wish, and when cold turn out and cut into slices. It is excellent.

Bean Soup.—Wash the beans and boil them with salt pork. When soft, take them out, and pass through the colander. Then put them hack in the same water they were hoiled in, with four hard boiled eggs cut in quarters, and a lemon sliced, and a little pepper if yon like it. Boil again, and serve. This soup is very nice.

Recipe for Mock Mince Pie.—One cup of raisins, one cup of currants, one cup of syrup, one cup of sugar, three-fourths of a cup of vinegar, one teaspoonful of allspice, one teaepoonful of cinnamon, three cups of water. Boil all together and when cool add three soda crackers rolled fine. This will make three pies.

Quick Cake.—Sieve three cups of flour, and add two teaspoons baking powder, a pinch of salt, one cup of sugar, three eggs well beaten, half a cup of butter, and sweet milk enough to make a moderately stiff batter. Bake twenty minutes in a good oven.

An Improved Method of Cooking Beets.—Bake them; it requires about two hours to bake a medium sized beet. I hardly think any person will resort to the old method of boiling them after eating one meal of baked beets.

"Clear as Crystal."

PEBBLES ARE MADE from Rock Crystal cut in slices and ground convex, concave or periscopic, for Spectacles. In Europe and in the Eastern States they are superceding glass.

Among the advantages they bave over glass are, that being susceptible of the HIGHEST POLISH, they transmit more rays of light, nothing having more transparency.

They are COOLER to the Eyes—a very important gain.

They are much harder than glass, and DO NOT SCRATCH.

The best quality of Crystal is found in Scotland and the Brazils, and is manufactured into lenses by the best workmen in England and France, for

Thomas Houseworth & Co.,

OPTICIANS,

No. 9 Montgomery street, Lick House,

Where they can be obtained, already fitted, in frames, or may be fitted to order.

Persons sending their Spectacles can have Pebbles inserted of the same grade as their glasses.

Illustrated Circular for style of frames sent to any address free.

H & L AXLE GREASE.

The attention of Teamsters, Contractors and others, is called to the very superior AXLE GREASE manufactured by

HUCKS & LAMBERT.

The experience of OVER TWENTY YEARS, specially devoted to the preparation of this article, has enabled the proprietors to effect a combination of lubricants calculated to reduce the friction on axles, and thus

Relieve the Draft of the Team,

Far beyond the reach of any who have but recently gone into the business; and as the H & L AXLE GREASE can be obtained by consumers at as

LOW A RATE

As any of the inferior compounds now being forced upon the market by unprincipled imitators, who deceive and defraud the consumer.

HUCKS & LAMBERT

Invite all who desire a First-class and Entirely Reliable Article, and which for Over 18 Years in this country has given such GENERAL SATISFACTION, to ask for the H & L AXLE GREASE. See that the trade mark H & L is on the red cover of the package, and take no other.

To Parties About Building.

A person who is competent to prepare plans and take charge of the construction of Dwellings, Mills, Bridges, or other architectural improvements, will make favorable engagements with persons or corporations in the city or the interior. Has had full experience on this coast, and can insure good satisfaction. Address

EDW. W. TIFFT,

5-v24-sa No. 626 Jessie street, San Francisco.

LEA & PERRINS'

CELEBRATED

Worcestershire Sauce.

Declared by Connoisseurs to be the only good Sauce. The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name of "Worcestersbire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ASK FOR LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and hottle.

Some of the foreign markets having been supplied with a spurious Worcestershire sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they bave furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.

Ask for LEA & PERRINS' Sauce, and see name on wrapper, label, hottle and stopper.

Wholesale and for export by the Proprietors, Worcester; Crosse & Blackwell, London, &c., &c., and by Grocers and Oilmen universally. 15v23-1y

And builders of Emery Grinders, Saw Gummers, Etc., Etc.
Emery Grinding Machines,
At $15, $25, $35, $40, $55 and $100. DIAMOND TURNING TOOLS, $15 each.
SOLID EMERY WHEELS,
From 40 cents to $113 each.
Every IRON FOUNDER can save money by using these Wheels to grind the sprues and gates off of castings. Every MACHINIST can save money, files, and labor, by using them to shape his lathe tools, to grind off chilled edges, to finish nuts, etc., etc. Every BRASS WORKER can use them on Brass. Every WOOD WORKER can use them to gum his saws, to sharpen his planer knives, to make his moulding cutters. For illustrated circulars address THE TANITE Co., Stroudsburg, Monroe county, Pa.

JUST ISSUED.
New, Enlarged and Improved Edition of
Nystrom's Mechanics.
A POCKET BOOK OF
MECHANICS AND ENGINEERING,
Containing a Memorandum of Facts, and Connection of Practice and Theory; abounding in Valuable Formula and Important Information concerning a Great Variety of Technical Operations. By John W. Nystrom, C. E. Eleventh Edition. Revised, and Greatly Enlarged by the addition of Original Matter. 16mo., Pocket-book form, gilt edges. $3.50.
FULLY ILLUSTRATED.
For sale by Booksellers generally, or will be sent by mail, postage prepaid, on receipt of the price by
J. B. LIPPINCOTT & CO., Publishers,
715 and 717 Market street, Philadelphia.
14v24-3t

AMOS & DAVIS,
Practical Millwrights and Draughtsmen,
213 Mission street, between Beale and Main,
SAN FRANCISCO.
Particular attention paid to all kinds of Millwright Work, especially to the erection of FLOUR MILLS, DISTILLERIES, etc. Also, Cogging Mill and Steamship Wheels. Manufacturers of Nash's Cutts Grain Separators. Builders of Improved Hydraulic Wine Presses, Grape Stemmers and Crushers, etc. 15v23-6m

RICHARD H. STRETCH, Civil Engineer,
City and County Surveyor.
Office—Room 16, City Hall. 11v24-3m

PACIFIC STONE COMPANY.
Ransome's Patents International,
For wbich Commissioners for tbe Exbibition of 1852 awarded the Prize Medal, and Gold Medal at the Mechanics' Institute Fair, 1871, of San Francisco.
REMOVAL.
This Company have removed from tbe corner of Turk and Larkin streets, to their new and Commodious works corner of Greenwich and Octavia. They have established an office and saiesyard at the Junction of Market and Bush, wbere they will keep constantly on band an assortment of ORNAMENTAL, BUILDING, CEMETERY and GRINDSTONES. Orders will be received at the above office from all who wisb to get good work at low prices. Send for Circular. 5v24-3amslamrly

Dupont's Gunpowder, Safety Fuse,
—AND—
WINCHESTER REPEATING ARMS.
DUPONT'S Superior Mining Powder (saltpotre), F-FF-FFF.
DUPONT'S Blasting Powder, in air-tight corrugated Iron Kegs, C-F-FF-FFF.
DUPONT'S Celebrated Brand, Diamond Grain, Nos. 1 2, 3 and 4, in 1 lb. and ½ lb. canisters.
DUPONT'S Unrivalled Brands, Eagle Duck and Eagle Rifle, Nos. 1, 2, 3, in half kegs, qr. kegs, 5 lb. tins, and in 1 lb. and ½ lb. canisters.
DUPONT'S Standard Rifle, Fg-FFg-FFFg, in kegs, half kegs and qr. kegs, and in 1 lb., ½ lb., and ¼ lb. canisters.
DUPONT'S Superior Rifle, A. F. & Co., F-FF-FFF, in kegs, half kegs, qr. kegs, and in 1 lb., ½ lb. and ¼ lb. canisters.
DUPONT'S Cannon, Musket, Meal and Fuse Powder.
EAGLE SAFETY FUSE (manufactured near Santa Cruz, Cal., by tbe L. S. & P. Co.) Constantly on hand full supplies of their Celebrated Brands, Waterproof and Submarine, Triple Taped, Double Taped, Single Taped and Hemp Fuse. Fuse made especially to explode the Giant Powder and Hercules Powder Caps.
The above named Fuse are warranted equal to any made in the world.
WINCHESTER REPEATING ARMS (Henry's Improved) and FIXED AMMUNITION.
A large and complete stock of tbese celebrated arms constantly on band, to wit:
Repeating Sporting Rifles—Oiled Stocks.
Repeating Sporting Rifles—Varnished Stocks.
Gold, Silver and Nickle-plated Rifles—beautifully Engraved.
Repeating Carbines—Oiled Stocks.
Repeating Carbines—Gold, Silver and Nickel-Plated and Engraved.
Muskets—Angular or Sword Bayonets.
Full stock constantly on band of all tbe different parts of the Winchester Arms.
Cartridges in cases (Brand H), manufactured by tb W. R. A. Co. expressly for their arms.
A full and complete stock of the above named merchandise always on band and for sale by
JOHN SKINKER, Sole Agent,
5v24-6m-1amr 108 Battery street, S. F.

The California Powder Works
No. 314 CALIFORNIA STREET.
SAN FRANCISCO.
Manufacturers and have constantly on band
SPORTING,
MINING,
And BLASTING
POWDER,
Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.
We have been awarded successively
Three Gold Medals
By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.
We also call attention to our
HERCULES POWDER,
Which combines all the force of other strong explosive now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other pompound now in use.
A circular containing a full description of this Powder can be obtained on application to our Office.
16v20-3m JOHN F. LOHSE, Secretary.

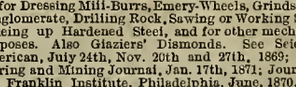
Patent Shaped Diamond Carbon-Points.
Fig. 1 Fig. 2 Fig. 3 Fig. 4


Diamond and Carbon, shaped or crude, furnished and set for Dressing Mill-Burrs, Emery-Wheels, Grindstones, Conglomerate, Drilling Rock, Sawing or Working Stone, Truing up Hardened Steel, and for other mechanical purposes. Also Glaziers' Diamonds. See Scientific American, July 24th, Nov. 20th and 27th, 1869; Engineering and Mining Journal, Jan. 17th, 1871; Journal of the Franklin Institute, Philadelphia, June, 1870. For Circulars descriptive, and Prices, send stamp to
1v24-6m J. DICKINSON, 64 Nassau St., N. Y.

The Best Zinc for Galvanic Batteries.

Mr. William Filmer has given us a few notes on this subject which will be interesting to our readers:

The form of battery used by silver platers, electrotypers, and in fact for all manufactnring purposes to which the galvanic battery is applied, is that known as the "Smee Battery." The three elements of this battery are dilute sulphnric acid, platinized silver and zinc plates. The sulphuric acid of commerce is generally sufficiently pure for practical purposes, but it is not so with the zinc, which is always more or less impure, sometimes so much so as to increase the working expense many times what it should really be. The impurities consist of iron, lead, and other metals which cannot be wholly separated from it in the process of smelting. Pure zinc is not acted upon by dilnte sulphuric acid, but when foreign metals are present with it an action more or less violent takes place, in proportion to the amount of impurity. This is partially overcome by coating the zinc with mercury. As long as the mercury remains on the surface no action appears, but it is necessary to renew the amalgamated surface sometimes daily, causing a considerable increase of expense as the mercury cannot wholly be recovered, it falling to the bottom of the battery vessel, and forming an amalgum with the zinc and its impurities. The extra expenses caused by using impure zinc are therefore the extra amount of zinc consumed, the mercury used to amalgamate it, and the sulphnric acid with which the surplus zinc has united. This waste is no small item in practical use, amounting from two to four times what it shonld be if pure articles were used.

In an experience of many years I have found that this waste may by reduced to a minimum by using what is known as the "New Jersey spelta." It is the pnrest zinc smelted. When immersed in dilute sulphuric acid it shows scarcely a perceptible action. I have used itthree-quarters of an inch thick, when it was necessary to amalgamate it, but twice until it was consumed.

In nsing small batteries, the zinc slabs are generally melted down and cast to the required size. This practice is bad, as in smelting in an iron pot, and pouring with iron moulds the zinc takes up more impurities, particles of iron and carbon, etc. It will be fonnd much better to take the original slab and either saw it with a circular saw, or if that is not handy to cut it with, a cold chisel, to the required size.

Mining Accidents.—A miner named Maher, at Oregon Gulch, Trinity County, was hurt last week by a falling plank. His ribs and one arm were broken.

Robert Welch was struck in the throat by a piece of rock from a blast in the Belcher mine last week. The rock went through his windpipe, but the wound is not dangerous.

The Pioche *Record* says that recently while the ore buckot was being lowered in the Bowery Shaft, 150 feet deep, the brake broke and the momentum of the bucket caused a general break-up of the hoisting gear. The windlass, bucket, etc., were precipitated to the bottom, but no one was injured.

H. H. Murray, foreman of the Wellington mine was smothered in an avalanche which occurred at Little Cottonwood on the 12th inst. His body was recovered. A number of other workmen were also buried by the same slide, which came, it is said, from a hight of 2,000 feet, but they were all got out safely.

Discoveries.—A quicksilver mine is reported to have been found in the northwestern part of Fresno Conuty and another in Napa County, in the mountains, near St. Helena.

The Weaverville *Journal* chronicles the discovery of an exceediugly rich quartz ledge on East Hay Fork containing both silver and gold.

An extensive deposit of crystallized sulphur is reported to have been found in the Beaver Mountains, Utah.

Bridges.—The Pacific Bridge Company of Oakland have procured gronnd on Berry street, near Third, and are putting up machinery for the manufacture of bridges. Hereafter all their timber will be dressed to an even size and framed by machinery invented for the pnrpose. This will render these bridges considerably stronger, and in the opinion of many engineers 25 per cent. more durable, as timber by being dressed has a smooth hard surface, which is less affected by moisture than when rough.

This company furnish bridges of any desired span ready to raise, with all iron work complete, or when desired they furnish the bridge and raise and finish the same.

They have already contracted for, or completed, bridges in the counties of Butte, Sonoma, San Mateo, Alameda, Merced, Marin and Santa Cruz. They are now erecting one over the San Lorenzo River for the California Powder Co., which has a span in the clear of 160 feet. It is built strong enongh for railroad cars, and will be completed the present month.

They will frame two bridges, one for Alameda county and one for Marin county, immediately. When their machinery is in motion we shall examine it and give a more extended description. The company intend to remove their office to the city as soon as their machinery arrives. They propose to make a specialty of working all kinds of heavy timber, and manufacturing heavy iron and wooden structures. They are still in room 14, Wilcox Block, Oakland, where they will take pleasure in showing all who call, models and designs in bridge architectnre.

New Incorporations.

The following bave filed certificates witb the County Clerk, San Francisco.

Pioche Champion Co.—April 11. Location: Nevada. Capital stock, $3,600,000. Trustees—George Reiter, Tbomas Findley, Geo. W. Beaver, J. D. Fry and S. Heydenfeldt.

Home Ticket M. Co.—April 11. Location: Eureka District, Nevada. Capital stock, $3,000,000. Trustees—S. S. Tilton, George L. Bradley, James Laidley, C. W. Fox and James S. Kennedy.

Railroad Consolidated M. Co.—April 13. Location: Nevada. Capital stock, $2,500,000, in 25,000 shares. Trustees—J. W. Moyle, W. F. Myers, S. S. Bowckes, S. D. Ingoldshy and S. W. Lee.

Pride of the Mountain M. Co.—April 13. Location: Nevada. Capital stock, $3,500,000, in 35,000 sbares. Trustees—George D. Roberts, Lafayette Maynard and Archibald C. Peacby.

St. Lawrence M. and M. Co.—April 13. Location: Placer County. Capital stock, $1,000,000, in 10,000 shares. Trustees—Marion J. McDonald, O. H. Bogart, Cbarles E. Gibbs.

French Gold Hill M. Co.—April 15. Location: Storey county. Capital stock, $500,000, in 5,000 shares. Trustees—R. F. Morrow, Cbarles Forman, George Treat, G. W. Beaver, H. H. Flagg.

Pacific Bridge Co.—April 13. Object: Tbe manufacturing and building of bridges, and wooden and iron structures in the Pacific States and Territories. Capital stock, $100,000, in 1,000 shares. Trustees—William H. Gorrill, Charles H. Gorrill and Cbarles F. Lucas.

Pacific Paving Co.—Object: To pave streets, do street work, contract and deal in all materials for street work and business operations in general. Capital stock, $100,000, in 1,000 sbares. Trustees—Wm. Ede, Cbauncy B. Williams and Horatio G. Livermore.

Mammoth Blue Gravel Co.—April 17. Location: Little York township, Nevada county. Capital stock, $2,000,000. Trustees—R. F. Knox, Abner Dohle, John Prince, James T. Dean and A. D. Carpenter.

Baltimore American M. Co.—April 17: Location: Gold Hill M. District, Storey county, Nevada. Capital stock, $2,400,000. Trnstees—M. Morgentbaul, J. W. Ford, John B. Winter, A. K. Grim and J. A. Coolidge.

An Appropriation of $50,000 bas been favorably reported on in Congress for the purpose of removing Rincon Rock, an obstruction in tbe harbor of San Francisco. The same action was taken in reference to the Wilmington break-water, at San Pedro, the port for Los Angeles, tbe amount being $75,000. Both of these appropriations will be of great benefit tq the harbors mentioned.

The Northern Pacific R. R. Co. are about to build a large car shop at Kalama. Grading on that road is now being prosecuted in Frost's Prairie, two miles south of Hodgson's.

Sales.—The Brown Mining Co's property in Colorado, consisting of the Glasgow, Brown, Coin and Mammoth lodes have been sold to the Hon. J. B. Chaffee, for npward of $18,000.

The Cedar Mine, near Bear River, belonging to J. R. Nickeson, sold for $15,000. The ledge is a large and promising one. So says the Auburn *Herald*.

Cullom and Co's smelting works, at Swansea, Colorado, have been sold to an English company.

The Gold Hill *News* understands that the Dunderberg mine, near Carson, has been sold to English capitalists for $200,000.

A Salt Lake company has purchased the Tecoma mine, says the Elko *Independent*, for $110,000.

The Mountain Lion Mine, in Ophir District, Utah, is reported sold for $200,000.

The Phœnix Ditch Co. bas sold out to J. T. McLean, and a contract has been let to hring a ditch to Tahle mountain.

Tbe Mount Jefferson mine in Sonora, is said to bave been bought by capitalists in this city.

Tbe Empire, Scbuyler and Scbnectady ledges in Wallapi District, Arizona, have been sold for $14,000, and tbe Union mine for $3,000.

Mining affairs in Trinity County are looking up, and recent developments are reported favorable. The county, always considered a good mining locality, has lacked capital, from its remoteness, and there is a probability that this essential element will no longer be wanting to renew its general activity.

The Owen's ledge, in San Diego county, the ore from which paid from $15 to $17 per ton when it was opened a few years since, and now pays $50 and $60, is doing finely and the prospects are flattering for an increase in the richness and a supply of ore.

[Publishers' Notice.]

From the Gold Hill News.

The *Daily News* of Gold Hill, Nevada, one of tbe most faitbful advocates of mining interest, alludes to Raymond's new book on "Mines, Mills and Furnaces" of the Pacific States* in favorable terms. We extract tbe following:

Tbe present work is in no sense a repetition of Mr. Raymond's former ones. It contains a full and comprebensive account of tbe gold and silver mining industry of the United States, with practical recommendations of great importance to those engaged in it. Tbe cbapter on tbe treatment of auriferous ores in Colorado is the best account of the stamp-mill process ever published in this country; and tbe general discussion of smelting processes for silver ores supplies an instant want. The series of volumns, of whicb tbis forms tbe third, which have proceeded from tbe rapid hut careful pen of Commissioner Raymond, are recognized in this country and in Europe as professionally autboritative and popularly interesting to a remarkable degree. To be technically accurate, but not tecbnically abstruse, is tbeir salient and acknowledged merit.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the Scientific Press, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Francis Mining Company--Location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 8th day of April, 1872, an assessment of one dollar per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary of the company, 409 California street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 14th day of May, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 4th day of June, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Trustees.

T. F. CRONISE, Secretary.

Office, 409 California street, San Francisco, Cal.

Ingomar Silver Mining Company—Location of works, Ely Mining District, Lincoln County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 2d day of April, 1872, an assessment of 25 cents per share was levied upon the capital stock of said company, payable immediately, in U. S. gold coin, to the Secretary, at the office of the company, Room 21, Hayward's Building, 419 California street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on Wednesday, the 8th day of May, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Friday, the 31st day of May, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Trustees.

CHAS. S. NEAL, Secretary.

Office, Room 21, Hayward's Building, No. 419 California street, San Francisco, California. ap8-4t

Lyons & Wheeler Mining Company—Location of works, Maynard Mining District, Mohave County, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 6th day of April, 1872, an assessment of Ten Cents per share was levied upon the capital stock of said Company, payable immediately, in United States coin, to the Secretary, at the office of the company, Room 3, No. 419 California street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on Wednesday, the 15th day of May, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 3d day of June, 1872, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Trustees. T. W. COLBURN, Secretary.

Office, Room 3, No. 419 California street, San Francisco, California. ap13

Marcelina Silver Mining Company.—Location of Works: Eureka District, Lander County, Nevada.

Notice—There are delinquent upon the following described stock, on account of Assessment (No. 2) levied on the Eighth day of March, 1872, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificats.	No. Shares.	Am't.
Cunningham, P. P.....22	200	$20 00
Cunningham, P. P.....23	100	10 00
Quinlan, P. B.....56	50	5 00
Worland, C. R.....58	1000	100 00

And in accordance with law, and an order of the Board of Trustees, made on the Eighth day of March, 1872, so many shares of each parcel of said Stock, as may be necessary, will be sold at public auction at the office of the company, Room 21 Haywards Building, 419 California street, San Francisco, Cal., on the 7th day of May, 1872, at the hour of 2 o'clock, P. M., of said day, to pay said delinquent Assessment thereon, together with costs of advertising and expenses of sale.

CHAS. E. ELLIOT, Secretary.

Office, Room 21, Hayward's Building, 419 California street, San Francisco, California.

Mount Jefferson Milling and Mining Company—Location of works, First Garote, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 3d day of April, A. D. 1872, an assessment of Thirty Cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company. Any stock upon which said assessment shall remain unpaid on Monday, the 6th day of May, A. D. 1872, shall be deemed delinquent, and will be duly advertised for sale, at public auction, and unless payment shall be made before, will be sold on Wednesday, the 22d day of May, A. D., 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Trustees. J.W. CLARK, Sec'y.

Office, 418 California St. San Francisco. ap13-4w.

Nevada Land and Mining Company---Location; Spruce Mountain, Antelope and Clifton Mining Districts, Elko County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 28th day of March, 1872, an assessment of four cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the Co.'s office, room 5, No. 302 Montgomery street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on Thursday the 2d day of May, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Friday the 24th day of May, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees

WM. H. WATSON, Secretary.

L. Rosenfelder.....184	10	20 00
H. Schumaker..... 84	5	10 00

And in accordance with law, and an order of the Board of Trustees, made on the 8th day of March, 1872, so many shares of each parcel of said Stock as may be necessary, will be sold at public auction at the sales-room of Maurice Dore & Co., No. 327 Montgomery St., on Wednesday the eighth day of May, 1872, at the hour of 11 o'clock, A. M., of said day, to pay said delinquent assessment, thereon, together with costs of advertising and expenses of sale.

E. J. PFEIFFER, Secretary.

Office—No. 210 Post Street, San Francisco.

Ophir Copper, Silver and Gold M. Company—Location of Works, Ophir, Placer County, Cal.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 18th day of March, 1872, an assessment of twenty (20) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, N. E. Cor. Sansome and Halleck Sts., entrance on Halleck street, San Francisco. Any stock upon which said assessment shall remain unpaid on the 20th day of April, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 17th day of May, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees. R. G. BRUSH, Secretary.

Office, N. E. Corner Sansome and Halleck Streets, S. F.

PACIFIC BRIDGE COMPANY,

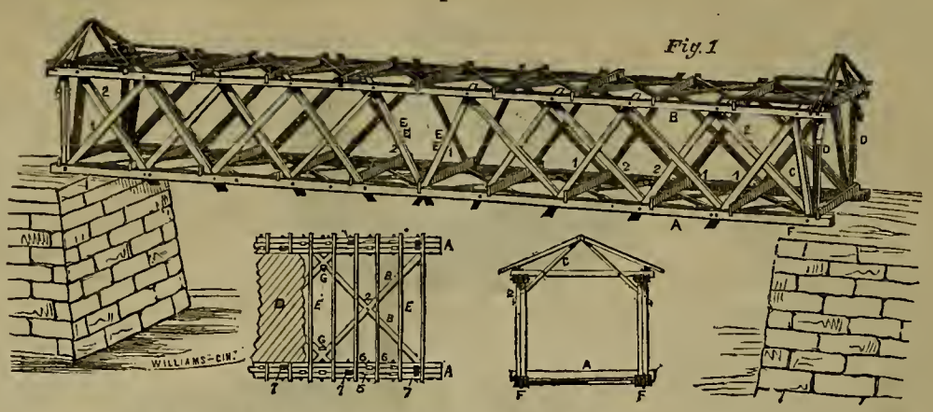

Fig. 1

WORKS NEAR SOUTH POINT MILL, BERRY STREET, OAKLAND, CAL.

Are Prepared, with Superior Machinery, to Manufacture and Build all kinds of Bridges on Smith's, Howe's, and other Improved Plans. Framing of all kinds done by Machinery.

These Bridges have been thoroughly tested in the East for Three Years, and wherever tried have proved superior to any other Bridge in the following points:

Being built of wood entirely, they are not affected by change of temperature.

The timber used is placed so directly in the line of strain, that less material is required to support the same load.

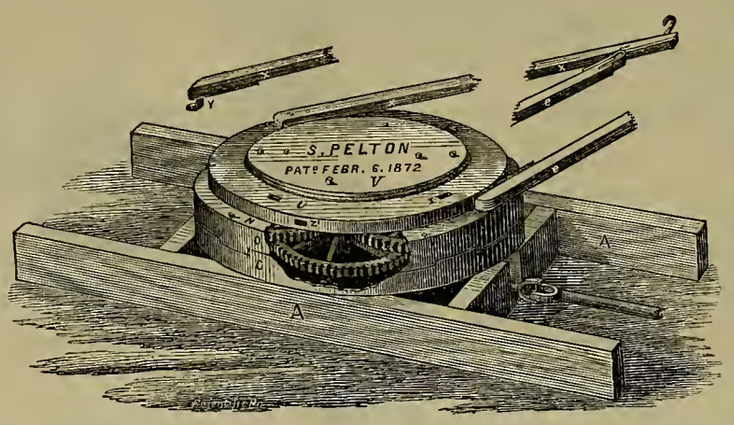
It is not perceptibly affected by shrinkage. It is the most Economical Bridge built. It is adapted to any practicable LENGTH OF SPAN.

Plans, Specifications and Terms will be sent to any County, Township or Person wishing to build a Bridge, and no charge made unless the Plan is used. For all Public Bridges the Plan will always be open to competition.

Smith's celebrated CAST IRON PIER, economical, and adapted to heavy currents, built at low rates.

C. H. GORRILL, Secretary. **W. H. GORRILL, President.**

THE CALIFORNIA GIANT.



PELTON'S SIX-FOLD POWER---PATENTED FEBRUARY 6, 1872.

THIS REMARKABLE HORSE POWER

Is more than Three-fold the strength of any Portable Horse Power in California, and as its name indicates, is emphatically of six-fold strength in its first and second gears. The bevel (or third gear), which drives the line shaft, is securely and substantially adjusted, and is of equal or sufficient strength to match the first and second six-fold gears. The place where the casing is broken away (in the engraving) shows two of the upper and one of the lower wheels of the six-fold gear. There is no longer any necessity for Threshers to use a Power that requires Fifteen Horses to work it!—which wear out and break down often, when they can be furnished one that is free from these faults—

Which will do the Same Work with Ten Animals!

The trial which I offer to all will prove its title to the merit I claim for it in my Pamphlets. All wishing MORE LIGHT ON THE SUBJECT, will please send their name and address for Descriptive Pamphlet to

SAMUEL PELTON, Patentee and Manufacturer,

16v24-1am Box 1732, San Francisco, Cal.

Silver Wave Mining Company----Location of works, White Pine Mining District, White Pine county, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the Tenth (10th) day of April A. D. 1872, an assessment of fifty (50) cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the office of said company. Any stock upon which said assessment shall remain unpaid on Tuesday, the fourteenth day of May, A. D. 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the Thirteenth (13) day of June, A. D. 1872, at the office of the company, at 2 o'clock P. M., to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees. J. W. CLARK, Secretary.

Office, No. 418 California street, San Francisco, Cal. ap4w

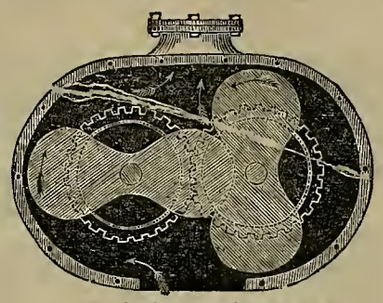
ROOT'S PATENT FORCE BLAST ROTARY BLOWER,



[Sectional view showing the pistons and gearing.]

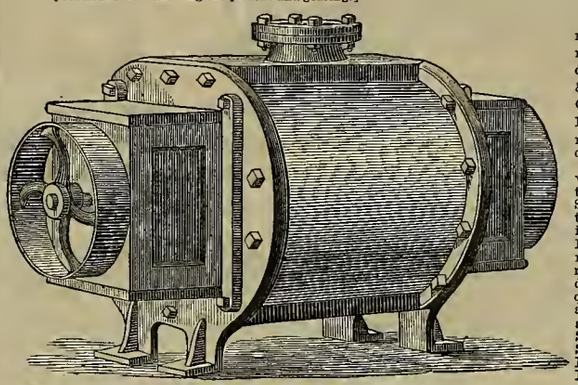
MANUFACTURED AT THE

GLOBE IRON WORKS,

Stockton, Cal.

Awarded the First Premium at the Paris Exposition.—Patented November 1, 1864; July 24, 1866; and October 9, 1866.

Adapted for Smelting, Foundry, Mining and Steamships. Requires 50 Per Cent. less power than any Blower now in use.



One of these Blowers may be seen at W. T. Garratt & Co.'s Brass Foundry, San Francisco; Gould & Curry and Savage S. M. Co.'s, Nevada; and at C. P. R. R. Co.'s Works, Sacramento; and other places on this coast.

CAUTION. — Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article. Quartz, Saw and Grist Mill, Iron, Stationary and Steamboat Engines, Horse-Power and Pumps, of all Sizes.

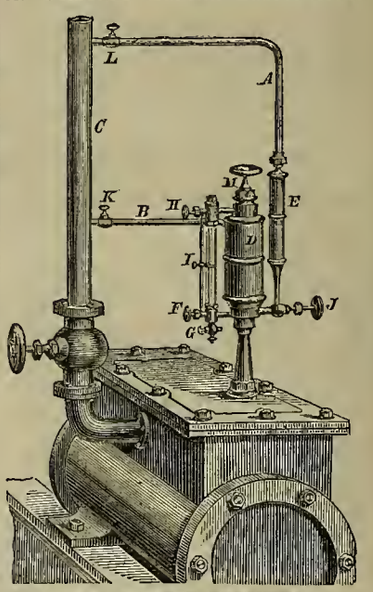
N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopped; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

For further particulars address

C. B. BROWN,
7v24-t Placerville, Cal.

Varney's Patent Amalgamator.
These Machines Stand Unrivaled.

☞For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlors for themselves, at the office, 229 Fremont Street, San Francisco.

BLAKE'S PATENT STEAM PUMPS.

WHAT IS SAID BY THOSE WHO USE THEM.

SALEM, Oregon, Jananry 16th, 1872.

MESSRS. BERRY & PLACE, San Francisco—Gentlemen: In answer to your qnery regarding the working of the large Blake Steam Pnmp, our company purchased of you, we would say in all sincerity that the pnmp *has exceeded our expectation*. It has been in use since the 27th of September, 1871, and has thus far given the most perfect satisfaction. It does its work with ease, does not get out of order, and requires but little or no attention to run it. It is SIMPLE, DURABLE, and PERFECT in its construction. We have found it entirely satisfactory and just the pnmp *in every respect* needed for our work.

Yours, respectfully, W. F. BOOTHY, Pres't Salem Water Works.

PHŒNIX MINE, Napa County, Jnnaary 10th, 1872.

MESSRS. BERRY & PLACE, San Francisco—Gentlemen: The No. 8, Blake Steam Pnmp we bought of you last fall is doing good service. We are having a large amount of water to contend with during this stormy weather; but the pump throws it all out of the main shaft (160 feet deep) with perfect ease, and in only working from 60 to 80 strokes a minute. It is a complete pump and no mistake. We are well satisfied with its working, and if you wish to use the name of our company, as a reference, you are at liberty to do so. Very resp'tly, GEO. FELLOWS, Supt. Phœnix Quicksilver M. Co.

OFFICE STARR MILLS, VALLEJO, Cal., Jnnaary 13th, 1872.

MESSRS. BERRY & PLACE, San Francisco—Gentlemen: We are pleased to state that the No. 3 Blake Pnmp purchased of you, has constantly supplied our three boilers for the past year, with water heat to above boiling point with one of Armstrong's Patent Heaters. It has given us no trouble nor expense, and has in fact fully come up to your recommendations. Yours, Etc., STARR BROS. & CAMPBELL.

OFFICE S. J. WOOLEN CO., SAN JOSE, Jannary 29th, 1872.

MESSRS. BERRY & PLACE, San Francisco—Gentlemen: We have used a No. 6 Blake Steam Pump now for about two years, both as a Tank Pump and as a Fire Pump in case of need: and it has given excellent satisfaction. *It suits us in every respect.* Very respectfully, R. F. PECKHAM, Pres't San Jose Woolen Co.

BELMONT, Cal., February 6th, 1872.
